We would not recommend the sonnet form for love poetry. It is too intricate and formal. Sonnets are rarely written by those who are in love. One does not carve trinkets from hot lava. They may be composed by one who is in the first stage of the malady, when the blood rushes to the head rather than to the heart; or when one is convalescent. Of course, we have sonnets written in Italian, English, and translated from the

Portuguese, which purport to have been composed in the heat of passion, but it is only great poets who possess the metrical facility to do this. Ordinarily a sonnet is merely the monument built over the grave of a dead passion.

Let us take as an example of the model love song that classic stanza which has borne the burden of more love than any other in the language. It is like an old coin, worn and rubbed from the handling of thousands, but being of pure gold, it is good yet for many a debt:

"The rose is red;
The violet's blue;
Sugar is sweet,
And so are you!"

This says all that is essential in a quatrain. And very nicely, too. Just see the graceful allusions to flowers by which the sentiment is introduced. What acuteness of observation and descriptive powers; and what fidelity to nature is manifested by the poet. No decadent and abnormal "green carnations" and "yellow asters" for him.

With true poetic insight and restraint he knows just when to stop. He might have gone on to tell her what color the sunflower is, and the petunia, but no. He is not, like Erasmus Darwin, writing a volume on botany in verse; he is writing a love poem and he must pass on to something more important.

But the transition, how can he accomplish that? How can he pass in one line of three words from horticulture to affection? Here is just where an inferior genius would fall down. But not our anonymous poet. Modern psychologists tell us that the sense of taste is intermediate between the visual and amatory senses. But long before the rise of modern experimental psychology his intuition had taught the poet this great truth, and here, as in so many instances which have been pointed out by the critics, the poet has anticipated the scientist.

Note the chord through which he, with the skill of a Wagner, effects this difficult modulation. There is only one adjective which is equally applicable to flowers, food and girls; one word of the 200,000 in the language. That one word, *sweet,* he chose with unerring instinct out of the whole dictionary-full.

A critic of the modern scientific school might object that the line might be improved upon by the substitution for "sugar" of the word *saccharine,* which is 300 times sweeter than sugar, but this shows the lack of taste which is characteristic of a scientific man when he meddles with things esthetic. The word *saccharine* lacks the connotation, the *aura,* of "sugar." It is associated with dyspepsia, while love poems are not written by dyspeptics, nor for them. Besides, the word *saccharine* is incorrect, and it would be necessary to substitute the true name of the compound which is benzoyl sulphimide; words which would derange the meter.

It will be noticed that the first three clauses are undeniable, almost axiomatic. This certitude is carried over into the conclusion in the last line, which, if it had been placed first, would not have been so forceful and impressive. Note, too, how the alliterative *s* binds together the subject "sugar" with the predicate adjective "sweet," and unites with these in indissoluble assonance the party referred to in the last line by means of the word "so."

And now for the closing line, *l'envoi.* This must be direct, personal and abrupt. It is the point, the application, the postscript, the moral, the *raison d'etre.* Here it is:

"And so are you."

It is not necessary for us to continue the subject further, for with these instructions, which, tho brief, are, we trust, lucid, the lover can proceed by himself, remembering words of Cyrano de Bergerac,

"A la fin de l'envoi je touche."

The Place of Art in Education

The questions raised by the resignation of Professor McDowell from Columbia University deserve a more serious consideration than they have as yet received. What place belongs to art in a scheme of liberal education? Can any man be called educated in a broad sense unless his appreciation of the great creations of the sculptor, the painter and the composer has been cultivated, equally with his appreciation of great literature and his understanding of the principles

of science? If we say that art is a necessary part of education, are we prepared to insist that the esthetic development of the student shall be a progress in critical discernment, or shall we be satisfied if we awaken in him a simple love of beauty in all its forms, which shall be for him a source of high enjoyment throughout his life? And, finally, if we say that education in art shall aim at the forming of a cultivated taste, by what means shall we try to attain the desired result? Is it sufficient to offer lectures and reading courses in the history and criticism of art, reinforced by collections of photographs and casts which the student may come to know familiarly? Is it enough to acquaint the student with music by performing for him the masterpieces, accompanied by explanatory analyses? Or, should we go beyond these limits and include in a college curriculum actual practice in musical execution and composition, or actual practice in drawing and modeling, as in a professional school?

The subject is as large and as complicated as it is important. Few men that have gone deeply into the philosophy of education will deny that art is a vital element in the spiritual life of man, and that no human being who is developed on the intellectual side only can respond to all of the nobler impulses of the age in which he lives. Even fitness for citizenship includes some ability to distinguish beauty from ugliness, and some capacity for spontaneous joy in beautiful things. A people that cares nothing for the glories of nature or for the creations of human genius ruthlessly destroys the wild life about it, ravages the landscape, and buries itself in brick wildernesses, where only sordid aims can find acceptance. It becomes callous in its materialism, and in time disregardful of the claims of humanity.

Moreover, in unspoiled human nature the craving for beauty is so imperious that it is bound to find satisfaction of some kind. A people that does not cultivate an appreciation of good art will certainly have bad art. If it has no touch of beauty in its streets—beauty of tree or of shrub, of column, fountain or statue—it will have the vulgarity of advertising spaces filled with those appeals that awaken the coarsest passions and shock every finer feeling, especially by their degradation of womanhood. A community that has not learned to care for the great drama and immortal music crowds the vaudeville theaters and the concert halls.

Happily the American people has awakened to a genuine love of the greatest art. It is easy for the cynic to say that New York enjoys superb performances of German opera because the opera is one of the opportunities that a vulgar "four hundred" can exploit to assert an aloofness from the common herd; but those that are acquainted with the facts know that the remark, while it contains an element of truth, is not the truth. There is nothing undemocratic about the audiences that winter after winter crowd the halls where the best orchestral music is carefully performed. Somewhat less strong than the passion for good music, but daily growing stronger, is the interest in painting and sculpture that is manifested by the crowds that frequent the Metropolitan Museum and the galleries where special collections are freely exhibited, and by the real enthusiasm with which the efforts of American sculptors at Chicago and at Buffalo, in the creation of the Dewey arch, and elsewhere, have been received.

This awakening of a people to the love of art demands recognition from those who shape the education of youth, and the demand will have to be conceded. Yet it does not follow that technical courses in music and drawing belong in the undergraduate college course. The close sympathy of all the arts with one another is a point to be remembered. The question may well be raised whether the old classical course, which has been pushed farther and farther into the background by the encroachment of utilitarian subjects, did not give, imperfectly but genuinely, a very noble training in the higher degrees of artistic appreciation. Certainly no sensitive nature can for years keep touch with the thought of Greece and Rome without feeling how vast was the part that art played in those old civilizations, and how vital was its association with the political evolution of the people. We do not say that such a means of awakening the interest in art, or of

cultivating it when awakened, is adequate to the needs of the thousands of students thronging our colleges and universities to-day. We only suggest that it contains a useful hint. May it not be that by strengthening the instruction in the humanities in general, by combining a non-technical study of art and music with the fairly established work in history and literature, the great object in view may better be obtained than it could be by merely adding new technical courses to curricula already overcrowded?

Graft

In the forests of Florida can often be seen a sweet-orange twig stuck into the side of a huge wild-orange trunk, and the trunk sawed off just above the insertion. In three or four years the twig has grown as large as it took the trunk a century to grow, and it has a fresh, smooth, young, rank and green texture, while the trunk is black and rough with age. The graft has become a graceful, luxuriant, fruitful tree on the sap of an industrious but misguided stock.

The treasurer of a local trade union was sentenced to the penitentiary for appropriating $12,000 from the treasury of the union. The union alleges that he got $27,000. The defense attempted to prove that the money had never come legally into the treasury, but was the proceeds of blackmail of contractors; but the court held that no matter how the union got the money, the treasurer held it in trust and was liable. It is understood that the money came to the union in large part as a percentage on contracts paid over by the employers' association in return for an agreement not to work for outside contractors. The treasurer was good-natured and careless. He distributed his funds liberally among his fellows. One of them got $5,000, went to Scotland and bought a farm. Others got $5, $10 and any amount you please. They re-elected him treasurer, knowing exactly whence came his loot.

This is an exhibit of the ramifications of graft when once it has taken hold. Union committees grafted on contractors, contractors grafted on builders, the treasurer grafted on the union, and the members grafted on the treasurer. Finally, one man is jailed as a scapegoat of the system.

A dozen controlling stockholders in corporations engaged on municipal contracts organize a new corporation, sell their old stock to themselves for new stock at two and three times its face value, advertise the absolute monopoly and the enormous savings to come from the consolidation, pay out unearned dividends, and finally are brought into court for a refunding. Here again is ramification of graft. Politicians and corporations graft on the taxpayers; "insiders" graft on the stockholders and on confiding investors.

A Post Office official organizes a "promotion syndicate" and takes a percentage from postal employees whose salaries are advanced. With others he takes a "rake off" on contracts.

A commission appointed to protect the Indians in the sale of their lands interests itself as individuals in land companies organized to buy the lands.

A league is formed to educate the workingmen; it raises a scare about the progress of socialism, gets the names of eminent men, collects contributions and does nothing.

Graft everywhere! Big grafters, little grafters, lesser grafters, and so on *ad infinitum!* Polite and artistic grafters, wheedling and insinuating grafters, bulldozing and vulgar grafters, all sorts of grafters suited to all sorts and conditions of men. One grafter is caught and punished while a dozen escape, for graft is not like violence, an outbreak that stops the wheels of society, but is beautifully adjusted to existing institutions. No wonder that District-Attorney Jerome says that graft is the one great menace to this Republic. Yet from one point of view he is mistaken. The grafters are a small minority. The non-grafters do not attract our attention. For one grafter there are a hundred honest men. Grafters cannot keep it up when there is nothing left to do but graft on one another. There must be enough honest, hard working people to serve as the "stock." But, from another point of view, graft is a menace, for it is the greatest danger in the way of a peaceable settlement of differences. If one walking delegate is convicted of graft, every walking delegate is immediately under suspicion. Employers

who formerly received them courteously on equal terms now become brusque and very busy, and haven't time to talk. A strike must be ordered to get a hearing. If one corporation promoter fools investors, every legitimate corporation finds it more difficult to sell its stock and bonds; and if the fooling is repeated a few times the investors hold off altogether and a panic smashes the entire list, good and bad. The public gets the idea that the whole corporation business is organized robbery which ought to be shut off by legislation. Instead of the businesslike, peaceable methods of negotiation, fidelity to contracts, and honest industry, the effect of graft is to substitute force, coercion and hostile laws. The hypocrite has blocked Christianity more than the infidel. Political graft makes more violence and disrespect of law than the anarchist.

Graft often gets protection from the mistaken view that to expose it is to injure the business or the organization. "Let the courts get the proof. We are not going to divide our strength by exposing those in our own ranks"—this is the excuse usually given for not throwing out the grafters. But graft is the hardest of crimes to prove in court. The victims are more afraid of retaliation than the grafters of punishment. And, of course, the business or the organization is injured as much as the victims by the presence of graft in its ranks. A walking delegate in New York is alleged boldly to have said to his union, "What do you care how much I get from the bosses? I have raised your wages from $2 to $4, and I spend my graft with you." Had there been no graft he might have raised their wages to $5. How can a delegate go to the bosses and stand for an increase in wages when he and they know that on former occasions they have bought him?

At the present time corporation investors and "corporation" editors are doing greater service for corporations in general by exposing grafters in their midst than they could by keeping quiet. Their only weakness is the suspicion that they attack one clique of grafters to protect another clique. Yet even the exposure of grafters by fellow-grafters shows that they recognize that the great public is honest. It is not criminal prosecution of grafters that is needed, but courageous exposure and expulsion by those whom they misrepresent.

The Yellow Peril

The Yellow Peril that we hear of, which first the Emperor of Germany, in a famous cartoon, declared to exist, and which now Russia and Russia's adherents in France and Germany declare to be threatening, is not a commercial but a political one. The evils of competitive cheap labor can be excluded by tariff walls, and as we have the right for our advantage to shut out competitive cheap Chinese productions, so China has the right to shut out our productions. But at present, at least, there is no particular evidence of danger of this sort. The commercial history of Japan does not yet show any such impending Yellow Peril.

This Peril is wholly political. If Japan should be successful in her war with Russia she would prove herself the Great Britain of the East. She would be more than that, for she would be more of a military Power, while also predominantly naval. She would have her Ireland in Formosa, and would have the immense advantage of a real foothold on the continent in her practical control of Korea, which would remain, as promised by the new treaty, nominally independent, but governed under her advice, as the feudatory states are governed by the Viceroy of India. Further, China would be under her acknowledged tutelage. The Chinese have as much native character as the Japanese. There is no reason why China should not, under such direction, with an Emperor delivered from the dictation of the Dowager Empress, and with a number of the principal Viceroys already eager for progress, make as rapid advance in the methods and arts of modern knowledge as has Japan in the last generation. Given Japan, Formosa, Korea and China, all awakened and regenerated, and the Philippines nearby, and we have a combination of racial strength and intelligence which embraces half the population of the world.

What will such a combination do? Will it be a peril?

It will certainly be a peril to all acquired or attempted aggrandizement of Western Powers in the East. When self-consciousness comes to all the Yellow

race, as it has to Japan, no infringement of their possessory rights will be allowed. Russia will not be permitted to hold Manchuria or Mongolia. The Germans in Shantung will be compelled to go, and the British in Wei-hai-wei and Hong-kong. The French will find their Asiatic colonies in Anam, Tonkin and Cambodia in perilous straits, if the people there desire to be delivered from French rule, and that will mean also the deliverance of Siam from French aggression. There is good reason for the close sympathy with Russia in the present war on the part of the Colonial party in France; for while Russia is trying to bite off a piece of China in the north, France is doing the same in the south.

The development and unification of a strong native Power in middle Asia would be felt in India, altho its people do not belong to the Yellow race. There is already a growing unrest in India, which aims at self-government. If Great Britain does not proceed to give more and more self-rule to India she cannot hope to hold her richest colony for more than a generation or so. She must learn the lesson which we are teaching in our colony, "the Philippines for the Filipinos." We cannot hold the Philippines —we ought not to hold them—except as we are preparing them for the same self-government that we expect of our own Territories and States. Whether, then, the islands shall be independent or be a part of our country is of no special importance; and just so it is not important for the future of the world whether India shall be free with or without Great Britain. Free in one form or the other she will and must be.

That there will be any Yellow Peril through China invading the West, as the Huns once invaded Europe, is past belief. Those days are gone. A different civilization prevails and will prevail. And we must anticipate the tremendous growth of Christianity and the sense of the rights of liberty, in the East and the West, in Russia and in China alike.

Nozaleda

THERE is much misapprehension as to the persistent reports from Spain to the effect that the opposition there to the acceptance of Bernardino Nozaleda as Archbishop of Valencia is based upon his desertion of the Spaniards and his making friends with the Americans after their entrance into Manila, where, until 1901, he continued to be Archbishop of the Philippine Metropolitan See. This is the prelate who, three days before Dewey arrived in Manila Bay, published an allocution to his "beloved sons," the Filipinos, assuring them that the Lord would not permit their base enemies to conquer. Of us Americans he said:

"A heterodox people, possessed by the blackest rancor and all the abject passions that heresy engenders, purposes to attack us. . . . If, for the evil of our sins, God should permit the intentions of the aggressor to prosper, the desolation and ruin of our people would be complete; soon would they see the heartrending spectacle of their temples razed, the altars of the true God profaned, and our religion swept away by the diversity of sects that the heretic banner protects. The peace of our homes and all the wealth of our people, united and ennobled by the teachings and practices of the Christian faith, would completely disappear, impelled by the implacable hatred that our enemies profess for the religion and races differing from its own."

And again, on May 12th, when a desperate effort was being made by the Spanish authorities to ally the Filipinos with themselves against the Americans, this genial Archbishop said:

"Poor Filipinos, the day that the North American establishes a permanent Government here. . . . Soon we will see an inseparable barrier established between you and your vainglorious masters. . . . Ye will be vilified as pariahs, exploited as miserable colonists, reduced to the condition of laborers, aye, and even to that of beasts and machines, fed with a handful of rice or of corn, which our lords will throw in your faces as daily ration. . . . Ah, what will prevent there being within a period of half a century no more Christian practices or beliefs in all this country, nor one person left here who would make the sign of the Savior's cross upon his forehead?"

As to the genuineness of these utterances there is no doubt.

Under his eye, during 1900 and 1901, Archbishop Nozaleda permitted his brothers of the Dominican order to publish insinuations, and finally even scurrilous and actually obscene attacks, upon Governor Taft and the whole Civil Commision in their daily newspaper in Manila, called *Libertas,* and bearing under

its heading the words "Blessed by his Holiness the Pope." Certainly, he cannot fairly be accused in Spain of being pro-American. He was trying to get away from the Philippine charge long before he succeeded, and upon his return to Spain in the summer of 1901 he at once began laying wires, through his order at Rome and Madrid, for an archbishopric at home. His purpose was once defeated by the storm of criticism of him by the liberal and independent press of Madrid and Barcelona as one of the men most responsible for Spanish downfall in the Philippines. The opposition to him on this ground was never particularly logical, as he could not have prevented the crash in the Philippines, in any event; but he was actively concerned with the management of affairs there during the months from March, 1898, when there began to be talk in Manila of preparing for war with the United States, until the time of the surrender in August, in which he played a prominent part as a negotiator, and public opinion in Spain has been hot against all the actors in those scenes. Moreover, there is in Spain, and has been more or less for a century, a very active campaign, especially in certain cities, against the religious orders. It is undoubtedly this sort of opposition that is now marshaled against the appointment of Nozaleda to the Archbishopric of Valencia. He is the sort of Spanish bishop which the Pope found it necessary to replace with Americans.

Hon. Wayne MacVeagh's Article

We have received from the Hon. Wayne MacVeagh the following note which he desired inserted in his article on the Venezuela Award published in this issue, but as it reached us after those pages had gone to press, we insert it here:

Mr. Bowen's first duty, no doubt, as representing Venezuela, was to secure the lifting of the blockade, but at least twice before the protocols of May 13th, 1903, were signed he protested with great vigor against allowing any preference to the blockading Power. On January 27th he said: "I cannot consent to give preferential treatment to the allied Powers;" and on January 30th he said:

"I object to paying first the claims of the allies and the claims of the other nations afterward, first, because I think it unfair and unjust and illegal to tie the hands of the said other nations for the period of five or six years that it would take to pay the claims of the allies. Second, if I recognize that brute force alone can be respected in the collection of claims, I should encourage the said other nations to use force also. Third, if the allied Powers wanted preferential treatment they should have asked for it in the beginning. But it is the first duty of parties who have invoked the assistance of arbitrators to settle a controversy to accept their decision with entire loyalty, even tho it may be difficult to fully appreciate the reasons advanced to justify it."

Saint Vardaman

The Devil is not as black as he is painted; Governor Vardaman stands a chance to be canonized by the negroes, who fled the State of Mississippi on his election. The man who won his election on a platform which puts the negro under foot, which gives him as little education as possible, and no suffrage at all, has flown in a special train to Batesville, ahead of the gathering mob, where, with the support of militia and the sheriff's officers, he took into his private car the negro who had murdered a railroad engineer, rushed him on to Jackson and put him safely in prison for speedy legal trial, all at an expense, they say, but it is hard to believe it, of $250,000, while the mob "was left lamenting" and cursing. It was a splendid act, a fine piece of courage and justice. Of course, we do not believe that it indicates any change of view as to limited negro rights; but within the limits allowed, which include life and a fair trial, Governor Vardaman has proved himself a man, and we take great pleasure in recording our hearty admiration for an act which surpasses in efficiency and promptness even the good work of Governor Longino.

Eligibility Rules

There is a great commotion at Brown University, because the Athletic Committee has voted to allow students who have accepted money for athletic services during the vacation season to play hereafter on Brown teams. This action is vehemently denounced by many friends of amateur sport in and out of the University, who consider it a long

step backward and a menace to the purity of college athletics. We admire the high purposes and sincerity of these critics, but they are mistaken. There is no more reason why a student should not work his way through college by playing ball on a summer hotel nine than by waiting at a hotel table. At present our eligibility rules are so tied up with red tape that they put a premium on inter-university back-biting when they do not actually prevent such undoubted amateurs as Glass from playing at all. The only sensible eligibility rule is the rule of scholarship, but the standard of this has been so lowered in some of our universities as to be no efficient bar against a man who comes to the university simply to enter athletics. Let any student with a good and regular class standing, however, compete on any university team, whether he plays for fun or for money out of school hours. If a man who has once played for money is so anxious to "make" a university team that he is incidentally willing to submit to the ordeal of acquiring an education, such a professional will never corrupt the amateur athletics of this country. The distinction between amateur and professional seems to be based in part on the old aristocratic idea that he who does anything, work or play, for money is in some sense degraded below him who only seeks amusement.

The Russian Complaint

Russia complains of Japan that the latter Power meddles with Manchuria, which is no concern of hers, and with which only China and Russia have to do. Let us see about this. In 1895 Japan occupied a substantial part of Manchuria with her army, and China had given it over to Japan. Japan had acquired it by war and held it by treaty with China. Then Russia interfered, and by securing the aid of Germany and France she compelled Japan to evacuate Manchuria and restore it to China. She did this on the ground that the tenure of Manchuria by any foreign Power would be a constant menace to the integrity of the Chinese Empire and to the peace of the East. So Japan had to restore Manchuria. Now this same Manchuria, not a part but the whole of it, is seized by Russia, not by right of conquest and not by treaty, and is held by force of arms. Further, in 1902 Russia solemnly promised to evacuate Manchuria, and has openly violated her promise. It is confessed that she does not intend to keep her word. Her rights in Manchuria are not near as great as were those of Japan in 1895. If Russia had the right to complain and interfere in 1895, Japan has a greater right to do the same now. The danger of the integrity of the Chinese Empire is greater by Russian annexation of all Manchuria than it would have been by the Japanese possession of a fraction of it. There is no question that, with the control of a fresh army of half a million Tartar Manchurians, the step would be short and quick to Pekin, to say nothing of Korea, and Japan itself would be immediately menaced. It is the instinct of self-preservation which compels Japan to protest with fleet and army against the Russian annexation of Manchuria.

Christian Democracy

We fear there will not be much democracy or liberty left in a Christian Democracy governed by the rules which the new Pope lays down in his "*Motu Proprio*," lately published. The Christian Democrats held a Congress in Bologna last summer, and it has been followed by considerable sharp difference of views, which the Pope condemns, and he lays down the rules which should control Catholics who go in for social reforms. They must remember that equality in society is impossible, that under God's ordinance there are princes and subjects, masters and proletariat, rich and poor, nobles and plebeians; that private property is an incontestable natural right; that justice requires duties of both capitalists and workmen; that the rich owe charity to the poor, who should not be ashamed of their poverty; that associations among the different trades and professions are valuable; that Christian Democracy is totally different from Social Democracy and must have nothing to do with politics, and indeed political action in Italy is forbidden to all Catholics; that Christian Democracy

must in all its action "strictly depend on ecclesiastical authority, and must offer full submission and obedience to the bishops and to those who represent them," and that "Catholic writers must, in all that touches religious interests and the action of the Church in society, subject themselves entirely, in intellect and will, to the bishops and the Roman Pontiff," and must submit writings of a merely technical character to the previous examination of the bishops. These rules all societies of Christian Democrats are requested to keep posted in their rooms, to have them frequently read, and Catholic newspapers are required to print them and approve and observe them religiously, on pain of interdiction. We make no comment on this document beyond this, that any body of people who are subjected to such submission of "intellect and will," and any newspapers that are under such obligation of approval and support under penalty of interdict, have our sincere commiseration. We wish we could believe that these commands are addressed solely to Italian Catholics. They do not fit elsewhere, if anywhere.

Where fulsome adulation is the rule toward one's friends we may also expect unlicensed abuse of those of a varying school. Some people imagine that all is serene peace in the Catholic Church, but where else would we find such severe criticism of one's fellow-religionists as the following written for the Catholic *Northwest Review* and quoted approvingly in the St. Louis Catholic *Review*. The visit of a French priest to the United States is thus described:

"In one diocese where Abbé Klein was received with open arms he was so skillfully piloted that he failed to notice the striking absence therein of all truly spiritual life. As the religious orders of men are carefully excluded from that diocese there is little or no interior life. Amid a great show of fine churches, elaborate music, and sensational preaching, the strenuosity of the true life hidden with Christ in God is sadly lacking. Meditation is practically unknown, piety is of the most perfunctory and ostentatious type, self-congratulation is the besetting sin."

We do not doubt that this is a malicious utterance.

Simultaneously with the news of the occupation of Korea by the Russian and Japanese armies, we received an invitation to attend a great missionary meeting in Seoul next September. We suspect the meeting will be postponed. Twenty years ago next September the first English-speaking missionary landed in Korea; now there are nearly two hundred missionaries engaged in the work there, and they count their converts by thousands. They have been the advisers of the court and the chief agencies for progress. Nearly all these missionaries are Americans—Presbyterians and Methodists. It is no unknown country to Americans which is the principal seat of the war.

It is good news that the committees on union of the Presbyterian and Cumberland Presbyterian Churches have agreed to recommend the consolidation of the two bodies under the name of the larger, and on the basis of the revised Confession of Faith and the new Creed. This will have to be approved by the two General Assemblies, and then by the presbyteries, and the actual union cannot be accomplished for a year. This grand result, if it shall be happily achieved, is the fruit, practically unanticipated, of the work of creed revision. Thus it proves worth while to do a right thing.

We republished last week Mrs. Shoup's very interesting story of "Senator Hanna's First Campaign," but we did not remember that her statement that Dr. Emerson E. White's residence was a gift to him from his old pupil, Mr. Rockefeller, had been contradicted as entirely untrue. Dr. White's son is now Governor of West Virginia.

Stagnation has certain advantages—nothing is stirred up. The Archbishop of Santiago says that Chile has never produced a single heretic. We have heard the boast that there was not an infidel in Kentucky, but we find it is not true.

Insurance

The Growth of the Giants

THE returns made as of December 31st, 1903, by the three giant life insurance companies of the United States show that their combined funds aggregate more than a billion dollars on a gold basis. The assets on that day were respectively: Mutual Life, $401,821,662; Equitable Life, $381,226,036; New York Life, $352,652,047; total, $1,136,699,745. This sum represents total assurance outstanding of more than $4,600,000,000, held by probably two million persons. The unbroken success made year after year by these companies since organization, marked in the early period of their existence by slow growth and during the past decade by a progress which, in extent and for absolute certainty, is unparalleled in all financial history, stamps the business of life insurance in all its branches as one of the most enduring institutions developed in this wonderful age. It would seem that, given a fairly capable and entirely honest management, failure has been rendered impossible. This is justly applicable to all the well established and going companies now operated on a legal reserve basis.

In ten years, or since December 31st, 1894, the assets of the three big New York companies have increased from $547,439,753, or 108 per cent., while the gain made in outstanding assurance aggregated only 74 per cent. The proportion of increase during the next ten years will be greater than that recorded for the period just closed, and it is confidently expected that by the close of 1913 these three companies will together control invested funds aggregating close on to two and a half billions of dollars.

Comparing their present holdings of $1,136,699,745 with other aggregated wealth, we find that it falls short but forty millions of the stock of bullion in the United States, which is estimated at $1,175,000,000; it is equal to the whole national wealth of Greece or Norway; to one-tenth the value of all the railway property in the United States; to six-tenths of the value of the railways of Russia; to twice the value of the bullion in the United Kingdom of Great Britain and Ireland; to all the bullion held by the Argentine Republic, Australia, Austria, Belgium, Canada, Denmark, Greece, Holland, Italy, Norway, Portugal, Russia, Servia, Sweden and Switzerland. These comparisons are based on statistics of the world's wealth compiled by Mulhall, which are regarded as accurate approximations, and are here referred to for the purpose of illustrating the quality of the underwriting and financial ability which, in less than an average of sixty years, has, commencing with nothing, accumulated what is probably the greatest wealth ever concentrated in the control of a few persons for beneficent purposes.

THE Home Life Insurance Company, of which George E. Ide is President, has accepted with great regret the resignation of its Vice-President, William M. St. John, to take effect May 1st. Mr. St. John, who has been in active business for more than half a century, will remain a member of the Executive Committee and Board of Directors. William A. Marshall, the Actuary, will be elected Vice-President.

Insurance Statement

CONNECTICUT GENERAL LIFE INSURANCE CO., HARTFORD, CONN.

During the year just closed the Connecticut General Life Insurance Company has been able to record the largest amount of insurance ever written by it in a single year, and the greatest actual and proportional gain in insurance in force.

The total amount of insurance issued and revived during 1903 was $4,710,724, which is $473,387 in excess of the issue of the preceding year.

The gain of insurance in force amounts to $2,784,441, which is 59 per cent. of the amount of the issue, while the amount of insurance in force December 31st ($23,527,566) shows an increase of 13.4 per cent. over that of one year ago. The gross assets of the company on January 1, 1904, were $4,984,648, as against $4,385,912 on January 1, 1903. The present liabilities of the company are shown to be $4,399,885, which signifies a net surplus of $584,763, which is a gain of $33,458 during the year. Robert W. Huntington, Jr., is Presidnet of the company. The Secretary and Actuary is James A. Turnbull.

GERMANIA FIRE INSURANCE COMPANY, NEW YORK.

The Germania Fire Insurance Company, of which Hugo Schumann is President, has a capital of $1,000,000 and a net surplus of $2,518,464. The total assets have increased $206,356 during the year, making $5,849,833 on January 1st.

Financial

The Steamship Trust

President Clement A. Griscom's retirement and the election of J. Bruce Ismay in his place mark the beginning of a new chapter in the history of the International Mercantile Marine Company, which is commonly known as the Atlantic Steamship Trust. With Mr. Griscom go his son and son-in-law; and the accession of the managing director of the White Star Line means that hereafter the methods of the Trust are to be those which made the White Star Company successful. Offices are to be consolidated, cumbrous managing committees are to be displaced by individual initiative and responsibility, and the comparatively simple and direct methods of the old White Star management are to be used. It may be that the depressed state of the company has been due to the unfavorable condition of the shipping trade, rather than to any serious fault of management. At all events, there is need of a firm and competent hand to cut off all unnecessary expenditures and to concentrate the energies of the subsidiary organizations. The enormous nominal capital ought to be cut down. The common shares are selling at $5, and the preferred at less than $20, while the bonds ($50,000,000 authorized) have recently been offered at $80. There appears to have been no market thus far for any of these issues. It is not true that the election of Mr. Ismay was opposed by Mr. Baker, the former head of the Atlantic Transport line. He was heartily in favor of it, and this probably was the attitude of other Atlantic Transport stockholders, who find that the Trust securities which they received in exchange for their stock are worth only one-third of the sum for which their shares could have been sold in the open market.

All this is not necessarily a reflection upon the capacity of Mr. Griscom, whose connection with Atlantic shipping for nearly forty years before this combination was made was highly creditable to himself. But his health is no longer of the best, and his management has suffered by reason not only of the condition of the shipping trade, but also indirectly on account of the manner in which the combination was formed, the excessive price paid for the White Star line, the attitude of the British Government, and the terms of the compact with that Government which the company found it necessary to accept in August last.

The Steel Corporation has closed a contract with the Bessemer Pig Iron Association for 130,000 tons of iron at $13 per ton, an advance of about 60 cents over the price prevailing in January. All the Corporation's iron furnaces are in operation.

....A merger of the McVickar Realty Trust Company and the Empire State Trust Company, of this city, has been authorized by the stockholders. The name of the new company thus formed will be the Empire Trust Company. It will have a capital of $1,000,000 and a surplus of $500,000. Leroy W. Baldwin is to be president, and H. W. McVickar, first vice-president.

....Dividends and coupons announced:

U. S. Leather Co. (Preferred), $1.50 per share, payable April 1st.

Colorado Southern R'way Co. (Preferred), 2 per cent., payable April 1st.

Iowa Central R'way Co. (first and refunding, 4 per cent.), payable March 1st.

Minn. & St. Louis R. R. Co. (first and refunding, 4 per cent.), payable March 1st.

Texas & Pac. R'way (Second Mort. Income), 5 per cent., payable March 1st.

Buff. & Susq. R. R. (Preferred), 1 per cent., payable March 1st.

Louisiana & Ark. R. R., First Mort. Coupon, payable March 1st.

(*Continued from page* 519.)

UNION CENTRAL LIFE INSURANCE COMPANY, OF CINCINNATI, OHIO.

The thirty-seventh annual statement of the Union Central Life Insurance Company, just issued, shows decided gains in all departments. The company now has gross assets of $38,795,143.78, which is a gain over the figures of 1903 of $4,684,597.58. Other gains made by this company during 1903 are given below:

Gain in income	$772,004
Gain in premium receipts	478,773
Gain in interest receipts	289,989
Gain in surplus	962,748
Gain in membership	8,749
Gain in amount of insurance	$14,494,594

John M. Pattison is President of the company.

The Independent

Vol. LVI NEW YORK, THURSDAY, MARCH 10, 1904 No. 2884

Survey of the World

National Politics

It is now expected that Senator Fairbanks will be the Republican candidate for Vice-President.—The proceedings of district conventions in Iowa indicate the defeat there of those Republicans who agree with Governor Cummins in calling for a reduction and a readjustment of the tariff. In the Senate, last week, Mr. Dalzell, of Pennsylvania, defined the policy of the Republican party with respect to commercial reciprocity, as he understood it, asserting that reciprocity, except in regard to non-competing products, would be opposed. The Kasson treaties, negotiated under the direction of President McKinley, would never be ratified, he said, because they were wrong in principle. Nor would reciprocity with Canada be supported. His references to certain tariff reformers as "the covert enemies of protection" were believed to be aimed at Governor Cummins and his followers in Iowa and adjoining States. Mr. Williams, the Democratic leader, replied that reciprocity, as defined and restricted by Mr. Dalzell, was a sham, because all the non-competing products were already on the free list. Mr. Lovering, of Massachusetts, a Republican, criticised the policy set forth by Mr. Dalzell, saying that "while this inert and 'stand-pat' policy prevails the great ship of business is drifting on to the rocks, and our boasted prosperity is coming to an end."—At the meeting of the New York State Democratic Committee, Mr. Murphy, the Tammany leader, was defeated by Senator Hill and those who favor the nomination of Judge Parker, but the majority was very small. There was no attempt to commit the organization to the policy of instructing delegates for Parker; but the Judge is now generally regarded as a candidate supported by Mr. Hill and, probably, by a majority of the New York delegates to be chosen. —Mr. Bryan continues to attack Mr. Cleveland. He also opposes the nomination of Mr. Olney. Concerning Judge Parker he says:

> "Mr. Bryan has been busy for nearly a year trying to find out Mr. Parker's views on public questions, but so far has failed. The nearest approach to a clear and definite statement is that Senator Hill will vouch for his soundness in every respect. This recalls a remark once made by John Randolph at the race track. Two strangers accosted him. One of them proposed a wager on a race, and added: 'Mr. Smith (the other stranger) will hold the stakes.' 'But,' asked Mr. Randolph, 'who will hold Mr. Smith?'"

—Joseph H. C. Turley, of Natchez, formerly postmaster there, has withdrawn from the Republican National Committee, owing, he says, to his disapproval of the President's Southern policy and "the supremacy of a Democratic dictatorship" concerning Federal offices in his State.—In the House, last week, Mr. Gilbert, of Kentucky, attacked the President for inviting Booker Washington to dine at the White House. Whereupon Mr. Scott, of Kansas, asserted that President Cleveland had invited to luncheon at the White House C. H. J. Taylor, a negro (whom he called "a ward heeler from Kansas City"), had lunched with him there and afterward had appointed him Recorder of Deeds in Washington. Three days later, Mr. Webb, of North Carolina, read in the House a letter in which Mr. Cleveland denied this story about the luncheon, saying that it was "a deliberate fabrication out of whole cloth." Mr. Taylor, he continued, had served as Recorder with intelligence and effi-

ciency, and his character had been very unjustly attacked by Mr. Scott. "He has since died. Some people restrain themselves from abusing the dead." Mr. Webb remarked that Mr. Cleveland was a friend of the negro, but had "never by word or act encouraged the dream of social equality in the breast of the black man." Mr. Scott offered his apologies. —The Maryland Legislature has passed the bill for a constitutional amendment designed to suppress the negro vote; also a bill requiring railroad and steamboat companies to provide separate compartments for white and negro passengers.—In Humphreys, Ark., the post office building was destroyed last week by a heavy charge of dynamite, because, it is said, the postmaster, recently appointed, is a negro.

A Navy Second to England's

In the course of debate, last week, upon the Navy Appropriation bill ($97,000,000), Senator Hale, chairman of the committee, said that if ships under construction were counted, and the presence of obsolete vessels in other navies were borne in mind, our navy was really surpassed only by that of England. At the completion of the program, upon which the Naval Board is now working, it would be far beyond all other navies except England's, and much nearer the latter than any one realizes who has not studied the figures. This program calls for 48 battle ships and 24 armored cruisers. Mr. Lodge argued that a powerful navy was the best insurance policy against war. Our navy ought not, he said, to be as large as England's, because hers must equal the combined navies of any two European Powers; but it ought to be, and in a few years would be, second in the list. The Monroe Doctrine was as big as the American navy, but no bigger. Mr. Carmack said that, no matter how large our navy might be, England's would overcome it in case of war with Great Britain, owing to England's coaling stations. Whereupon Mr. Stewart remarked that while England was overcoming our navy we should be taking Canada. Mr. Hale said that extensive additions to the navy were required by our acquisition of the Philippines and the coming construction of the canal. For his part, he would like to get rid of the Philippines.—Two or three days later, when several Democrats argued that a large navy would provoke war, Mr. Depew said that we ought to have a navy large enough to enforce the "open door" in China. So long as we had a good navy we should have to be consulted concerning any partition of China. Mr. Nelson (a native of Norway) asserted that the interests and sympathies of the United States were with Japan in the present war. Mr. Hale and others protested against such declarations, saying that strict neutrality should be observed.—The resolution requesting Secretary Cortelyou to ascertain whether the Beef Trust is violating the injunction granted last year will be reported favorably in the House.—At a hearing before the Post Office Committee Assistant Attorney-General Robb, in answer to questions, said it was true that certain persons had escaped prosecution (for postal offenses) by reason of the statute of limitations. When asked whether Perry S. Heath was one of these, he replied in the affirmative, adding that, owing to Heath's official and political position, he would have been glad to prosecute him. Senator Scott sharply reproved Mr. Robb for saying this, and had the remarks stricken from the record. The bill prolonging the limit of the statute from 3 to 5 years will be favorably reported, and probably in such form as to allow the prosecution of persons whose offenses are now less than five years old.

The Isthmian Canal

It is expected that the members of the Panama Canal Commission will sail for the Isthmus before the end of the month. Colonel Gorgas, the surgeon and sanitarian whose work was so effective in Cuba, will have charge of the sanitary administration on the Isthmus, using there the methods adopted by him in Havana for the exclusion and prevention of yellow fever. At every consular office of our Government in the important ports of Mexico, the West Indies, Central America and South America there will be stationed a surgeon of the Marine Hospital Service to prevent the departure of yellow fever suspects from those ports

for the ports of Panama. One has already been sent to Guayaquil, and another to Callao.—Attorney-General Knox has advised the President that he is authorized to pay $10,000,000 to Panama and $40,000,000 to the Canal Company. He is satisfied that the title to be transferred is good, and the company has been notified that our Government is ready to take the property. It is held at Washington that the two suits of Colombia in Paris will cause no restraint or delay. Four or five weeks are required for the preparation of the papers, but it is said that at the end of that time the purchase will be completed. To provide for the payments, Secretary Shaw has called upon the depository banks to surrender about $30,000,000 before the 25th. Panama will probably invest $8,000,000 of her money in United States bonds.—The Panama Assembly has passed a bill prohibiting the immigration of Chinese, Turks or Syrians. Immigrants of the prohibited classes now on the Isthmus may remain, if they have property or are engaged in lawful professions; if not, they are to be expelled within thirty days. —It is asserted that a troublesome race question has arisen on the Isthmus, owing to the dissatisfaction of the negroes, who in former years held many public offices but are now excluded from them. —The Panama Republic has been recognized by Chile, Mexico, Argentina and Brazil.—Recent reports say that Joaquin Velez (not General Reyes) has been elected President of Colombia.—The Mexican Government is preparing to fortify the harbor of Vera Cruz, and will, it is said, not only take similar measures for the defense of other ports on each coast, but also establish a navy by the purchase of several battleships and cruisers.

Testimony of the Mormon President

The only witness examined last week in the matter of the protest against the admission of Reed Smoot, an Apostle of the Mormon Church, to the Senate, was Joseph F. Smith, President of the Church during the last three years, who has five wives and is the father of forty-five children. His testimony has attracted much attention, owing to his admission that since living in the polygamous relation was forbidden by the Woodruff manifesto in 1890 and by law he had continued to live with his five wives, who had borne him eleven children since that date, each wife having become the mother of at least one. "I preferred," said he, "to take my own chances with the law and to suffer any consequences the law might visit upon me rather than to abandon my children and their mothers." He knew he was violating the law, but he preferred "to face that situation rather than to desert them." The people of Utah, being broad-minded and liberal in their views, had condoned his offense, he said, if offense it was, and had not interfered with him. On Saturday, after testifying for four days, he became excited and declared that Congress had no right to inquire as to his private affairs and pry into his marriage relations. He was answerable to the courts of Utah, he added, and it was not his fault if they did not call him to account. Earlier in the week he had said that several of the Apostles, whom he named, were polygamists. It appears that one of these, M. W. Merrill, has eight wives, forty-eight children, and more than 150 grandchildren. A majority of those holding high office in the Church, President Smith said, were polygamists. Whether they have violated the law since 1890, as he has done, remains to be shown by their own testimony or that of others. Mr. Smith said that no plural marriages had taken place since 1890 with the consent or knowledge of the Church. A rule of the Church since that year had forbidden a member to live with more than one wife. He had violated this rule as well as the law. Smoot had never advised him to refrain from violating it. He believed in plural marriage as having the support of a divine revelation to his uncle, Joseph Smith, Jr., the founder of the Church; but many Mormons had not accepted the doctrine, thousands had rejected it, and only 3 per cent. had practiced plural marriage. "If the principle were attacked," said he, "we should defend it." He admitted that Smoot before becoming a candidate for the Senate had applied to the Church authorities for permission to do so, which was granted. When questioned as to a Mormon's duty concerning a revelation in conflict with the laws, his answers left

something to be desired. It might be with himself, he said, that the revelation would be uppermost; the Mormon people, he thought, would obey the law rather than a revelation in conflict with it. Many revelations were cited from the books, among them one directing the organization of a joint stock company to build a boarding house. An Apostle, Mr. Smith said, who should ignore a revelation because it was in conflict with law would be out of harmony with his associates. He admitted that he had said in a public address last year that any one rejecting the doctrine of plural marriage might as well reject all the other doctrines of Mormonism. Polygamy, however, was permissive and not mandatory. It was not now taught in the Church or by its officers.

Philippine and Other Islands

In Jolo General Wood has again attacked Hassan's band of hostile Moros, and so punished them that all are now dead or in custody, except Hassan himself, who escaped. At the beginning of this little war Hassan had a force of 3,000 men. In the recent engagement the Moros were twice invited to surrender, but they preferred to fight. Seven Americans were wounded, one mortally. General Wood had the aid of the Sultan.—In the Senate, at Washington, last week, the Frye bill, requiring that coal and all other supplies for the army and the navy shall be carried in United States ships, was passed by a party vote of 35 to 17, but with a provision authorizing the President to employ foreign carriers if the freight rates of American ships are excessive and unreasonable. Amendments providing that all the employees on the ships must be American citizens, and for reports concerning freight charges, were rejected. The American union wages for sailors and firemen on the Pacific are said to be more than ten times the wages for which Lascars are hired. The other Frye bill, restricting to American ships all the trade between the Philippines and the States, will soon be passed, but with an amendment deferring the enforcement of it until July 1st, 1905. There is said to be an understanding that the Republicans will repeal or reduce the tariff on Philippine products before that date, as compensation for the increase of freight charges; but such a change will be opposed by those who are interested in the protection of sugar and tobacco. Hawaiians complain that the bill will harm their industries. Owing to the similar restrictions applied to Hawaii in 1900, they say, freight charges have been increased and they have been unable to find enough American freight ships for their trade with Atlantic ports. To apply the restriction to the Philippines, they add, will still further increase the charges and reduce the number of ships available for their exports.—The tobacco workers of Manila ask Congress to remove the duties on their products, saying that these taxes make the exportation of such products to this country almost impossible, and that for this reason their earnings are less than they were under Spanish sovereignty.—Secretary Taft's bills, authorizing the Philippine Government to issue $10,000,000 for public improvements and to promote the building of railroads by guaranteeing bonds or net profits, have been introduced in the House.—The elections in Cuba, to fill half the seats in the House, were marked by no disorder whatever. There were Liberal gains, but the result is regarded as a victory for the moderate element. A new treaty relating to the Isle of Pines (a copy of the one that lapsed) has been signed at Washington.—In Porto Rico the leaders of the Federal Party, which elected 10 of the 35 members of the House, are trying to strengthen their organization by calling it the Porto Rico Union, and supporting a platform calling for independence or statehood.

A Lynching

Governor Vardaman has interposed vigorously a second time this past week to prevent a lynching. He has been even more active in this matter than was his predecessor, Governor Longino. The occasion for this unexpected activity appears to have been the lynching of a negro and his wife at Doddsville, Miss., on the 7th ult. There had been a quarrel between the negro, named Holbert, and a white planter, named Eastland,

which ended in an exchange of shots, in which the white man was killed; whereupon Holbert and his wife fled, but were overtaken by the pursuing mob. The sequel is thus told in the *Evening Post,* a Democratic daily, of Vicksburg, Miss.:

"A citizen from the Doddsville neighborhood, who witnessed the burning of the Holberts, last Sunday, was in the city this morning and told of some new horrors connected with the terrible event that have not yet been printed. He said the affair was probably the most terrible one of its kind in history. When the two negroes were captured they were tied to trees, and while the funeral pyres were being prepared they were forced to suffer the most fiendish tortures. The blacks were forced to hold out their hands while one finger at a time was chopped off. The fingers were distributed as souvenirs. The ears of the murderers were cut off. Holbert was severely beaten, his skull was fractured, and one of his eyes, knocked out with a stick, hung by a shred from the socket. Neither the man nor woman begged for mercy, nor made a groan or plea. When the executioners came forward to lop off fingers Holbert extended his hand without being asked. The most excruciating form of punishment consisted in the use of a large corkscrew in the hands of some of the mob. This instrument was bored into the flesh of the man and the woman, in the arms, legs and body, and then pulled out, the spirals tearing out big pieces of raw, quivering flesh every time it was withdrawn. Even this devilish torture did not make the poor brutes cry out. When finally they were thrown on the fire and allowed to be burned to death, this came as a relief to the maimed and suffering victims."

The Dreyfus Case

The Criminal Branch of the Court of Cassation has granted the appeal of Alfred Dreyfus for a revision of his trial at Rennes on the ground that the evidence now presented indicates the possibility of an error. After a thorough investigation of the documentary evidence and the examination of witnesses, which may take several months, the findings will be presented to the court as a whole, which may thus pronounce final judgment or may order another military trial. It is generally expected that the result will be the acquittal and vindication of Dreyfus, for Attorney-General Baudoin declares the "secret dossier" contains "only miserable documents whose sole importance was due to the mystery with which they were shrewdly surrounded." It is very curious that there is no popular excitement and very little interest over the prospective rehabilitation of Dreyfus, whereas only a few years ago any man who expressed a belief in his innocence was met with furious wrath and made to suffer in some way for his opposition to popular prejudices. The two important statements on which the appeal for revision was granted are that the letter betraying the secrets of the French army and signed "D" was originally signed "P.," and was altered in order to incriminate Dreyfus, and that the letter signed "Alexandrine," relating to the French railroads, was really written on March 25th, 1895, when Dreyfus was in prison on Devil's Island. This was in part in the handwriting of Colonel Henry, who committed suicide in prison after confessing to having forged some of the documents in the case at the command of his superior officers. The decision of the court at Rennes which condemned Dreyfus for the second time was largely based on these two letters.

The Attitude of France

The prompt concurrence of M. Delcassé, Minister of Foreign Affaairs, in Mr. Hay's proposal for the preservation of the neutrality of China, "and, in all practicable ways, her administrative entity" has relieved the minds of the French people from the fear of being dragged into the war; but at the same time it is made the ground of a furious attack upon the Government, in which the Clerical, Anti-Semites, and all parties opposed to the republic join for its overthrow. The clamor of the papers against the United States and England is like that of the period of the Spanish War, but with the additional element of the popular dread of the "Yellow Peril," which the Anglo-Saxon nations, at the instigation of the Jews, are supposed to be secretly promoting. There was very little enthusiasm expressed for Russia at the outbreak of the war, but now the papers are full of it and public subscriptions are being made for the relief of the Russian wounded. M. Jaurés, one of the Socialist leaders, and until recently one of the Vice-Presidents of the Chamber of Deputies, in an address at a

Socialist convention at St. Etienne, declared that the alliance with Russia ought to be abrogated or relaxed, because it might bring France into action contrary to her policy of peace. This opinion was denounced on all side as traitorous and ungrateful. France had for fifteen years enjoyed tranquillity through confidence in this alliance, and it would not be consistent with national honor to seek to withdraw from it now, when, for the first time, it demanded some risk and sacrifice on her part. It is given out, apparently by authority, that Russia offered her armed support at the time when the Fashoda incident seemed likely to lead to war with Great Britain. The Socialist group in the Chamber of Deputies, which form the main support of the Combes Cabinet, repudiated M. Jaurés, by declaring that they "affirmed their absolute fidelity to the traditional policy of the country and to the engagements made by it."

Turkey and Bulgaria

The Porte has announced that owing to the arming of Bulgaria and the Albanian revolt, of which the ostensible cause was the inauguration of the administrative reforms demanded by the Powers, it is impracticable to carry out the plan for this reorganization of the Macedonian gendarmerie, evidently assuming that of the two Powers most active in imposing these reforms, Russia and Austria, one at least has other things to occupy her attention. Turkey is assembling a fleet of warships and torpedo boats, and troops are being collected at various points. Bulgaria has declared the frontier under martial law, for the purpose, it is claimed, of preventing the communication of Bulgarian sympathizers with the insurgents in Macedonia. It is claimed by the Greeks that the people of Macedonia are more afraid of the revolutionists than of the Turkish soldiers, and that the refugees who have fled to Bulgaria for protection were forced to do this by Sarafoff and his bands of brigands, who burned their houses and forced them to leave their homes in order to arouse the sympathy of the Bulgarians and of Europeans generally. The Greeks, who in the two vilayets (provinces) of Monastir and Salonica are said to outnumber the Bulgarians by 278,000, do not join in the Pan-Slavic aspirations of their neighbors, but favor annexation to Greece rather than independence or the protectorate of a northern nation.

Kuropatkin

General Alexei Nikolaevitch Kuropatkin, who has been appointed Commander-in-Chief of the Russian army in Manchuria, has seen more active service than any other military leader of his time. He is fifty-six years old, a stout, broad-shouldered, red-faced man, unpretentious, energetic, bluff of speech, intolerant of officers of the fashionable and pleasure-seeking type. When he left the Imperial Military College of St. Petersburg he was offered, through the influence of his father, who was a wealthy nobleman of Pskoff, a position in the Imperial Guard at the court, but he chose instead a commission as sub-lieutenant in the Turkestan Rifles, and took part in the Bokhara campaign. He was chief of staff under Skobeleff in the conquest of Khokand, and in the Russo-Turkish war of 1877 he displayed great energy, endurance and bravery in the long and hard fought siege of Plevna, being night and day in the thickest of the fight. Archibald Forbes, the war correspondent, gives this description of Kuropatkin and his redoubtable chief:

"I was sitting in my tent writing a dispatch," says Forbes, "when the flap was suddenly drawn aside, and in stalked the most terrible and awe inspiring object I have ever seen in my life.

"It was Skobeleff, whom I knew well, but I had to look twice before I recognized him. His smart general's uniform was torn into shreds and stained with blood and gunpowder from head to foot.

"While he stood there telling me about the battle his favorite captain, Kuropatkin, came up, and called him away to decide about the disposition of some of the prisoners. Kuropatkin looked even more like a god of war fresh from the scene of carnage.

"He was bleeding from half a dozen wounds, but he stood as steady as a rock when he saluted Skobeleff. The latter suggested that he had better go into the hospital, but he curtly replied:

"'No, General. There is work to be done.'"

He also served with Skobeleff in war against the Turcomans and led his brigade on a twenty-six day march across an arid desert to take part in the siege of Geok Tepé. Afterward he was em-

ployed in reorganizing the Russian army and pushing forward the railroad conquest of Central Asia. He has published several works on Asia and the strategy of the campaigns in which he has been engaged, and some of these are used as standard works in military schools of other countries. Much of the success of the expansion of Russia in Eastern and Western Asia is due to the plans drawn by him as Minister of War, for he has a more thorough and practical knowlege of Asiatic campaigning than any other Russian.

The Bombardment of Vladivostok

At half-past one on the afternoon of March 6th a Japanese fleet, composed of five battleships and two cruisers, approached on the side of Ussuri Bay, within about five miles of the fortifications of Vladivostok, and bombarded them for an hour. According to the official report of the Russian authorities the bombardment did no damage and was not replied to by the forts. It is not known whether the four cruisers composing the Russian northern squadron were in the harbor or not. The Japanese vessels were covered with ice, but it is evident that the port of Vladivostok is more open than has been supposed. The shells used were mostly 12 and 6 inch, loaded with lyddite, but most of them failed to explode, and the cost of the ammunition thus expended is estimated by the Russians at $100,000.—The report that the Japanese had landed at Possiet Bay and were advancing on Hunchun is not confirmed, but part at least of the Japanese forces which have landed in Northeastern Korea are pushing their way through the mountainous region near the northern boundary of Korea in the direction of Hunchun, and a Russian outpost has been placed on the south side of the Tumen River to check their advance into Russian territory to the west of Vladivostok and threatening its communications.

Japanese Advance in Korea

The mystery surrounding the movements of troops still continues. Newspaper correspondents have been accredited to both armies, but are not yet allowed to go to the front, and probably will not be until the first land battle has been fought, which may not be for a week or more. The Russians will certainly not hasten it, as they are profiting by the opportunity of getting more troops and supplies into Manchuria, and General Kuropatkin has not yet left Europe to take command. The Japanese general staff has only just reached Korea, and it would be extremely difficult campaigning in Northern Korea until the weather moderates and the ice breaks up in the Yalu and Korean rivers, so the Japanese fleet can co-operate with the army in their advance along the west coast of Korea. The Japanese army is stationed at Ping-Yang, and between this and Yalu River there are no Russian forces of importance. The main body of the Russian army is at Liao-Yang, a station on the railroad between Mukden and Port Arthur, from which point troops can readily be sent to the defence of Niuchwang or the Yalu, according to which side of the Liao-Tung peninsula the Japanese may try to land. Japanese troops have been landed at Wonsan and other ports on the eastern coast of Korea, probably with the intention of marching across to the Yalu on the north of the Russian position at Antung.—The Japanese fleet has withdrawn from Port Arthur, perhaps to support the northern advance of the army.—The harbor of Chinnampo is now sufficiently free from ice, so that Japanese troops can be landed there, which is nearer Ping-Yang than Chemulpo.—A special session of the Japanese Diet has been called for March 13th, and the elections for it have been held.

Luther and the Papacy

The discovery of a lot of documents in the Vatican archives dealing with the Indulgence traffic that in Luther's day was the outward occasion for the beginning of the Reformation, has led to the resignation of Professor Schulte, the director of the German Historical Institute in Rome and originally a Catholic professor in the University of Breslau. These documents seriously exposed the money-making character of the whole business, which was conducted largely through the banking houses of the Fugger of Augsburg, and the Milan

Corriere, an exceptionally well informed paper, declares that the suppression of these documents has been decided upon by the authorities, a matter to which it seems Schulte, who is not an adherent of the Ultramontane school, objected. Other journals report that the Chief Librarian of the Vatican, the Jesuit Pater Ehrle, has declared that he would not object to the publication of these finds, as they contained nothing essentially new. The Assistant Archivarius of the Vatican, Pater Denifle, has recently published a work on Luther and Lutheranism (*Lutero ed il Luteranismo*) that is being translated into all the leading languages and is proving an international sensation, having in Germany already called forth replies from the two most influential Protestant theologians in the country, Professors Harnack and Seeberg, of Berlin. The characteristic feature of the book is that it manipulates the workings of Luther and other Reformers in such a way that these and their work appear in most hideous forms and self-condemned. It is a new application of the historical methods of Janssen, who in this way proved from authentic sources that the Reformation was the greatest calamity that ever befell Europe and civilization. Denifle has been honored by being permitted personally to present a copy of his book to the Pope. A number of Catholic papers, especially in Italy, condemn the peculiar literary methods and manners of the new Dominican biographer of Luther and his work. The leaders of the "Reformed Catholicism" in Germany continue their work through their organ, the "Renaissance," of which the layman, Dr. Müller, is the chief editor. In reporting a discussion which he recently had with the papal Nuntio Nicotera of Munich, the latter is declared to have summarized his position in the words, "The Pope is the Church."

Coloration in Iowa Animals

In his address before the section of Zoology of the American Association for the Advancement of Science at the recent St. Louis meeting, Prof. C. W. Hargitt calls attention to the importance of the study of animal coloration from the chemical and physiological standpoint, and shows the inadequacy of natural and sexual selection to account for it in the case of lower invertebrates. The numerous and striking examples of bright colors and elaborate designs in all forms of animal life have generally been explained as protective by securing concealment in assuming the appearance of the customary surroundings. Many conspicuously colored species were found to be unpalatable, and so would be avoided by their enemies, while edible forms of similar coloration were supposed to mimic these in order to share this protection. Ingenuity has evidently been carried too far in the construction of complicated theories based on mimicry and protective coloration, and some of the most striking instances turn out on closer study to be mere coincidences. Of course, sexual selection cannot be considered in the case of the lower forms, and in the deep sea, where many of the most remarkable color designs are found, they cannot be due to natural selection. Here, is in so many other points, Darwin is not liable to the sharp criticism now suffered by his overzealous followers, for he expressly states that natural selection cannot account for all cases, as, for example, the markings on shells of mollusks, but that they are probably due to the structure of the shell and manner of its growth. This explanation indicates a more profitable line of study than that which has hitherto been fashionable, for it is found that many of the pigments are the waste products of metabolism, and are deposited in the skin or shell to rid the living tissue of them. The curious and intricate patterns are, then, due merely to the arrangement of the muscles and excretory vessels. That the cod and other fish at certain points along the New England coast, where the rocks are covered with scarlet seaweed, are also scarlet, is not to render them inconspicuous, but because their food contains a red pigment. The brighter colors of the male of many species, as among birds, is owing to a greater activity in the vital processes. According to this chemical theory of coloration, the colors in at least some plants and animals have no more significance and require no more explanation than the colors of minerals.

Why I Gave Up the Ministry—A Soul's Tragedy

[The author of the following article, of course, does not wish to have his name known. We sent it to Wilford L Robbins, D.D., Dean of the General Theological (Episcopal) Seminary in this city, who added the following comment, the justice of which we leave to the reader's decision: "The inclosed does not seem to me a very weighty article, nor one very difficult to answer. The key to this young man's 'tragedy' seems to lie in the fact that, as far as one can judge from his words, the distinctively spiritual aspect of life seems never to have dawned on him. Under the circumstances it is hardly strange that he has lost a sense of vocation. Nor is it strange that men failed to have recourse to him in matters pertaining to the spiritual life. I wonder if the rector with the parish running up into 'four numbers,' who found only six in a thousand of his parishioners wanting spiritual counsel, was not in somewhat similar plight?"—EDITOR.]

IT is a matter for much quiet surprise, altho of little expressed comment, that in the past few years so many clergymen of prominence have given up the active work of the regular ministry to enter some other field of work. Such work is closely affiliated with the work of and ministry, to be sure, but yet distinct and different from it. To be specific, those other fields are noticeably three: these persons have become professors in schools or colleges, lecturers under auspices of societies and associations, or editors or writers in some special field of journalism or of general literature. The same movement has always gone on to some extent, no doubt, but it has been especially noticeable within the past half dozen years. During those years, too, the movement has been the same, but with this difference—that, whereas then men left the ministry reluctantly, now they seem almost eager for a chance to abandon it as a profession for almost any other that is at all honorable.

But this paragraph is not meant for consideration in itself. It only serves as introduction to what may, I hope, prove worthy of consideration: that is, the way in which to-day *young men* as well are leaving the ministry. In their case the taking of this step means not a mere transition from one profession to another; it means abandoning, for the time being at least, professional life entirely. They are not far enough on to command their own future or to dictate any terms. If they leave the ministry they must leave it not knowing where they will go. And yet they are leaving it.

To cite that group with which I am most familiar—namely, my own classmates—forty men who attended together in one class a well-known theological seminary and graduated six years ago—ten have, even in that short time, entirely abandoned their profession. Nor does this ten include those who dropped out by the way—that is, who abandoned their course of preparation before it was completed. They are ten of the thirty men who graduated, who were ordained in one denomination or another and began to preach. To go into detail, they are thus distributed: Four are tutoring or teaching, two are life insurance agents, one is a salesman in some capacity, one is cultivating a farm, one is "running" a Settlement House, and the tenth is myself. I have not exaggerated in this statement. The figures represent cold facts.

As for myself and my present status, I am thirty-two years old—at that point where I should be most active in that profession for which I have spent my life thus far in fitting myself and just now ought to be most happy in it. Instead, I am deliberately resigning it and leaving all behind me. My purpose here is to set forth a statement of my motives, to analyze a situation and to search for reasons why other men along with myself are doing this.

There are several things commonly cited as reasons for thus abandoning this profession which are *not* my reasons. Let me state these first, therefore, in order to set them aside. *First:* It is not because of *ill-health.* The clergy are often charged with making this an ex-

cuse for vacations, trips abroad and various delectable diversions. If this criticism were just—and perhaps sometimes it is—the same criticism might often be passed upon those who professedly for this reason give up altogether. In such a case the real motive would not be hard to find. It would be laziness, tho called by any other name. But this is not even my professed reason. I am healthy, strong and well.

Secondly: I did not give up the ministry because I was a failure in it. On the contrary, in the five years that have passed since my "Commencement" I have made more than ordinary progress. Here, of course, one is under the constraint of some embarrassment. It is difficult to speak without laying oneself open to the charge of egotism; but here are the facts: I graduated on one day, passed my examination for orders on the next, was ordained on the third day, and within a week had been appointed an assistant in a parish (of the Episcopal Church) where I served my first two years. At the end of that time I accepted a call, unsolicited, to an independent position, where I have continued for three years. Nor am I leaving here now after any "church quarrel," but in love and charity with my neighbors and in bonds of sympathy and intimacy of which it is not in place even to speak.

A *third thing* that is often operative either to drive men out of the ministry or to hold them in it is *money*. Either its presence or its absence may be an influencing factor. But this not so, either way, with me. I have neither so much, nor so little, money. For a man may have too much money. Its possession may impair his usefulness in the ministry by separating him from the people he tries to serve. He may be so unfortunate as to have been born rich and thus be so aristocratic in his tastes and habits that he simply cannot meet men on their own ground. Or he may suddenly become rich by some lucky strike or accident and thus go the way of Jeshurum, who "waxed fat and kicked."

Or, on the other hand, he may have too little money. He may find that, with the largest salary he can ever hope to have, he cannot become rich. He may by nature be impatient and become unable to curb this impatience. He once thought that he could deny himself in order to serve his fellow-men, and he undertook to do it; but he discovers later that he has that ingenuity which would have enabled him to succeed in some especial line of business, and now so longs for opportunity to try it that he cannot resist the temptation. If this be the case he will fret under restraint for a few years, but, sooner or later, he will throw off such restraint and follow his natural bent. In neither sense, I say, has this reason been operative in my case. On the one hand, I am not rich; on the other hand, at the end of five years I am drawing a larger salary than I had ever hoped to earn in any other field of labor.

As a *fourth* negative reason, there is not *a woman in the case.* Very often, in fact generally, in looking for the reason here, the old French rule would be a safe one to follow: "*Cherchez la femme.*" Like the presence or absence of money, so, too, either the presence or the absence of a wife may force a man either to abandon or to cling to this profession. He may, unfortunately, have married a wife who is worldly and who, altho she thought she could be sympathetic with him in his work, finds that she simply cannot be, and that she cannot longer bear to be "a pastor's wife." Or, again, she, acting as an adjunct, may constrain him to continue in the ministry. She may be the leading spirit of the two, and he in everything subordinate. Still again, they may have been married early in his career, and now, inasmuch as his salary is their living, he dare not give up one position long enough to find another. Or yet again, he may be only in love; but he may love, and that with a world of affection, one who sees in his profession, and in it alone, an impassable barrier to union with him. He must choose between the two. If so, he will eventually give up the one to gain the other. But here also such is not my case. I am, by good or evil fortune, unmarried and untrammeled.

Now, after this elaborate negative statement, is it possible to find any *positive reasons?* In fine, dare a man who has once put his hand to this plow even look back? Can he ever do so without forfeiting his own fitness for the Kingdom of Heaven? To put it still differently,

and that in the interest of clearness, are there any valid reasons why a man who has once entered the ministry is at liberty ever to leave it? If so, what are they?

Well, there are two that are most commonly felt and consequently most often suggested. I have felt them both and suffered under each of them, but still I hold these to be *minor* ones and do not dignify them with the name of "valid."

The *first* is *a feeling of revulsion* at the type of man with whom one must associate. Any man in the ministry of any strength himself has felt this at some time. The probability is that he began to feel it back as early as his college days. He noticed there that strong men prepared to study law or medicine, weak ones theology. Even there he was tempted to believe that men who found themselves fit to do nothing else considered themselves called to preach. Later he feared that he found this suspicion confirmed in his Divinity School. When he compared the *personnel* of students in the seminary with that of the student body in college he decided that, upon the whole, the average here was inferior to the average there. After he has graduated and moves among the "brethren of the cloth," he still feels the same thing. Eventually this feeling comes to weigh upon him: it oppresses him.

I do not mean to say that this feeling is justified: the personal element enters so largely and personal pride is so strong. I have heard this very thing said by almost every clergyman I know, and am sure that they who say it feel it. The curious thing is the way in which each one seems to think that he himself is fit, but is not quite sure about anybody else. I know, too, what a large part self-conceit might play here; and yet I am just as sure that in my own case this feeling is not wholly a sign of egotism. I have merely come deliberately to believe that statement heard so often—namely, that the ministry to-day is not the profession which attracts the strongest men.

If one is content to accept figures here in proof of facts he will find them in an article entitled "The Careers of Scholarly Men in America," published a few months ago in *The Century*, written by a professor in Columbia University, who says:

"By far the most striking change in the careers of scholarly men in this country has been the decrease in the number of them in the ministry. A Phi Beta Kappa man was three times as likely to become a clergyman fifty years ago as he is to-day. The percentages in different years are: 1840-49, 38.7 per cent.; 1850-54, 36.5 per cent.; 1855-59, 34.5 per cent.; 1860-64, 27.5 per cent.; 1865-69, 28.5 per cent.; 1870-74, 22.5 per cent.; 1875-79, 22 per cent.; 1880-84, 19.5 per cent.; 1885-89, 16 per cent.; 1890-94, 14 per cent."

From this and other facts he concludes that:

"The future will probably witness a steady gain in medicine, a slight gain in teaching, a rapid but unstable gain in the law and a continued decline in the ministry."

A *second* subordinate reason is found in *a feeling* that the young man in the ministry to-day has, or ought to have, of *something not far from dishonesty.* If he is as honest as he ought to be, he dislikes everything that bears the semblance of a pose, and when he compares himself with the other young men whom he knows—men of his own age in other professions—he realizes that he is no better than they are, and it grates upon his nerves to think that he should be considered so, or be considered one of those who think that they are so. He notices, too, that young men who were his companions once in college, and who are now working along other lines, work harder than he does. They have to do so in order to win corresponding position or promotion. He notices, too, that their average salary is smaller. Again, he notices that, both as regards their time for study and their opportunity for gaining social prestige and position, they are restrained in a way that he is not. He comes to wonder why, or whether at all, he is entitled thus to rank or pose above them.

And, furthermore, and worse than this, for my own part I have come to feel, and that deeply, that these young men of whom I speak, my *confrères,* lead a more normal life than I do. They have less restraint and less constraint. What they do they do naturally; what I do I have to do in large measure professionally. When they choose their pleasures and must deny themselves some that they would choose, they refrain because these are illegitimate in themselves: the only reasons operative are those of practical

ethics; they have no one to consider but themselves; while I, when I choose, must take into account not only what is lawful, but what is expedient as well; not only what I myself may think, but what some one for whose opinions I am responsible, and whose conduct by my example I may influence, may think also. Consequently, I feel that all their social life is much more normal, sane and natural than mine is or can be.

Again, I come to the conclusion that, upon the whole, these men are more useful in the community and often are more deeply interested in the things that ought to form its deepest interest and chief concern than I am or can be. For example, they are interested in politics. So am I. But their interest is an active one, while mine is, of necessity, more or less languid. They take the stump, make speeches and solicit votes; I cannot do this, at least I may not without laying myself open to the charge of being a mountebank. Again, they do such things as man and officer the regiments of the National Guard; I can do neither, for I am under the restraint of being professionally incompetent to serve in warfare or bear arms. And so on throughout a long list.

But these, I know, are only minor reasons both and never worth considering so seriously that they would overrule that deeper feeling of conviction that one ought to have that he is right. Where, then, are *the "valid"* reasons? Are there any? I remember talking with an older man once upon this matter who reminded me that there are two—that is to say, there are two qualifications that a man must have, else it is criminal for him to pose before his fellows; and, *vice versa*, if he has these two he need never charge himself with, nor fear to be charged with, dishonesty in standing forth before his fellows as their comforter, their teacher, counselor and leader. The first of these is sincerity of belief; the second is purity of life. Said he: "Do you earnestly believe the things that you preach? And in your private life are you above reproach?"

In this diagnosis of my own case I must answer these two questions thus: *First*, I am sincere in my beliefs. To be sure, those beliefs are different from what they were ten years ago; but that is not the point. I do not believe, indeed I most profoundly disbelieve, a hundred things that I was taught; but, then, in that I differ not at all from everybody else. I do believe most earnestly the things I preach; I will preach nothing else. But, even so, the question then is: Can a man, upon his own beliefs, found or maintain a church? Is he free to do so? And is it worth the doing? I think not.

Regarding the *second*, I do lay claim to purity of life also. But even that I think is scarce the point. The point lies in the question: Just what constitutes such purity? In short, what is the attitude of superiority or of inferiority toward other men that will insure success here? For my own part I find that I am neither quite good enough or quite bad enough to be such a "success" in the ministry. By being "good enough" I mean being that kind of a man who never makes mistakes, but who in all his conduct is immaculate. There are such men, but I have always noticed they are weak men and that their goodness is wholly of a negative sort. By being "bad enough" I mean that kind of a man, at the other extreme, who is so thoroughly shrewd and deceitful as always to appear good and never to be caught. There are such men also. But this, too, I can neither do nor be.

But do even these two things, when thus defined, constitute reasons for abandoning a profession entrance into which involved one thing not known in other fields, namely, that curious thing, a "Call"? Well, *just what is a "Call"?* Did I imagine I was called? Yes, to be sure I did; but, then, in just what did that "call" consist?

For one thing, it goes without saying that *it came early*. It had of necessity to come fifteen years ago, for it is that many years since I began my preparation. At that time I was sixteen years of age. Did I at that age know enough about either God or man to decide to stand between them? I thought I did, and in my limited knowledge of them both perhaps I was justified in believing then that I was. Maybe, too, I was so then. I do not know. I only know that since then I have changed. The change has been produced in part by my long course of study and in part by years of growth. I could not have foreseen these things

then, nor may I now be held responsible for either. I may, however, reckon with the facts as they are now.

And, to be further analytic, just what are these facts? *In just what did that change consist?* As tersely as I can put it, in this: that, whereas then I wanted to help men and thought I saw how, now I even more earnestly want the former, but I much less clearly see the latter. The method then was plain, the desire only moderately strong; now the desire is much stronger—so strong, indeed, at times as to be overwhelming, but the method is less clear—so obscure, indeed, at times that I confess I have no theory as to what it is at all. In other words, as fifteen years have passed, that early desire has deepened and strengthened, while the method has grown indistinct and vague, with corresponding rate of insistency and intensity.

Nor is this true in my case alone. I lay it to the charge of every man in the ministry to-day that he is in much the same condition. At least this is true in the Protestant Church. It is not so true of those who serve the Roman Catholic Church. The task of the Roman priest is still plain. He has a clear conception of what he is trying to do, and, whether it be worth or not worth doing, he still knows the way to get it done. He has what I have not, a simple *terminus ad quem.* It is simply a fact that among the Protestant clergy there is an ever increasing obscurity of conception regarding the very task itself they have before them. In the past dozen years alone that task has shaped itself differently in different periods and is perpetually shaping itself differently to different men. Once the Evangelistic method claimed the best of their attention; then great missionary enterprises found all emphasis laid on them; then came the study of Sociology as the sole means toward the desired end, and then the building of parish houses, the doing of institutional church work, the raising of money for the endowment of hospitals, schools, asylums, etc.

Now, to what does all this lead? It is at this point that my doubt takes its deepest plunge, for this I believe to be the most important point of all. It shapes itself into the question: *Will the Church continue to exist at all?* Of course, there are those who answer this question affirmatively, and that dogmatically, and find the reason for their answer in their conception of the Church itself, its origin and its nature. They believe that origin to be divine and they concern themselves but little for the future of it, confident that that future will take care of itself. I wish I could be so complacent. I cannot. I can find no reason for believing in the Church's perpetuity apart from its mission, and the duration of its mission I conceive to be determined by its utility. If the Church proves to be worth perpetuating it will stay; if not, it must go, as have gone before it other institutions created in the service of religion and even certain forms of that very Church's own worship, such as that in monasteries and that subsequently in cathedrals. Nothing is more idle than to employ statistics to prove whether people are or are not attending church more generally to-day than they did a generation or a century ago. Perhaps they are; perhaps they are not; that is a simple question of fact. The question of more importance is that regarding the enthusiasm which they manifest in what they do when they are there. It is not so hard to see that this enthusiasm is not great, indeed that it is so trivial as to be inconsiderable. Nor is it hard to see that, while the figures representing church attendance, reckoned absolutely, may still be large, relatively the number of young people is appallingly small. This being the case, the question arises: Where is that adherence and support to come from in the next generation? Will it even come at all?

And that in turn raises one other point, embodied in one other question: *Should the Church persist?* Is it not possible that things have changed even in the past quarter of a century alone and that they are changing to-day with such accelerating rapidity that we have come to the point where it is seriously to be doubted whether the Church, with its pulpit, is the best medium of expression for religious or any other opinion? The press, the public platform and a dozen other agencies have so widened their scope and so broadened their sphere that any one, not to say all, of them have become dangerous competitors.

I know, and that right well, that at

this point there are those who assert that even the preaching, teaching function of the Church is not its chief function, and that, therefore, even tho this one should be superseded, it has a larger, a more vital and a more peculiar function—namely, that of administering spiritual comfort and counsel and developing spiritual energy and power in the lives of individuals who are its wards. Well, just what are the facts here? To what extent do the Church's members themselves to-day look to the Church's clergy in their official capacity for such service? The pastor of one of the largest congregations in New York, a congregation whose nominal "membership" is reckoned in four figures, and himself an earnest, godly man, tells me, in confidence, in perplexity and despair, this. Says he: "I keep, five days in the week, throughout the year, an "Office Hour," partly in order to economize my time, but in larger part to give to any one who wants to see me upon any matter ample opportunity to do so freely and yet privately. In one year alone I have been interviewed by a thousand different persons; yet in only six cases, by actual count, have these callers come to me regarding spiritual matters. They have asked for money, for influence, for advice in worldly affairs, in short, for everything under the sun—except for spiritual counsel!

What, then, is *the result of this decline* in both these functions of the Church? Is it not this? The Church, thus driven by competition to widen its field, has sent its clergy out, or at least has allowed them to go out, to do many things in the name of religion which have nothing whatever to do with it. The clergy to-day are busy? Yes. But busy doing what? Not things they ever were ordained to do. They are busy as managers of institutions, as members of committees, as representatives on boards, as trustees of asylums, orphanages, schools and hospitals, dispensaries and colleges, and builders for themselves of parish-houses, where they organize and execute affairs of clubs and guilds, societies and institutes. They were not "ordained" to do these things, nor did they need years of professional training to become able to do them. Thus it would seem that those men who are busiest in the ministry to-day are busy only doing things which lie wholly outside of that especial sphere, so far as there ever was a special sphere for work in which they were especially trained, in so far as they ever were specially trained. For my own part, I must either find for myself some work in the Church which is sufficiently unique to justify my continuing in the unique position of a "calling," or I must abandon the latter here to find the former somewhere else.

And what is my purpose in writing this? It is to sound frankly a note of honesty: to speak a word in self-defense for those who act as I am acting. I differ not at all from dozens like myself, some of whom have left the Church already, others who will leave it soon, and many more who would do so were they not restrained by the things I have recited at the outset. I differ from certain of those who happen to stay in, I am quite sure, only in that I happen to be free to step out. I feel that there is nothing dishonorable in the step that I am taking. I have simply lost my mission and my message, and have found the courage necessary to give up a lucrative position without present hope of finding even one in which to earn a living. Far has it been from my desire to say anything that may by any possibility sound flippant. On the contrary, these pages record a veritable soul's tragedy. It is because of the delicacy of the disclosures, and that alone, that I choose not to sign my name.

"Floundering and Foundering"

BY JUSTIN McCARTHY

"MANY a year is in its grave" since Gladstone on a famous occasion described a certain British administration as "floundering and foundering." No words could more effectively describe the condition of the Ministry of which Mr. Arthur J. Balfour is just now so unlucky as to be the leader. The House of Commons has been mainly occupied since the opening of the session by discussions which have to do with the complex questions for the raising of which we are indebted to the pushfulness and the peculiar intrepidity of Mr. Chamberlain. One might have thought, however, that the members of any Government would have no difficulty in making up their minds as to whether they agreed with Mr. Chamberlain or differed from him on questions which, beyond all dispute, are of vital interest to the Empire. Is the Conservative Government composed of Free Traders or Protectionists? That is the plain and simple question which now calls for a decisive answer.

The ordinary mortal might well have taken it for granted that the members of Mr. Balfour's administration must have already made up their minds on this subject. Some of the men who were until lately members of that administration seem to have had no difficulty in making up their minds. Mr. Chamberlain resigned office because he had become a Protectionist and would not remain a member of any Government which did not go in plain and square against Free Trade. The Duke of Devonshire, Sir Michael Hicks-Beach, Mr. Ritchie and others gave up their Ministerial places because they were thorough and convinced Free Traders, and refused to remain in any administration which admitted of a compromise with the system of Protection. But as the Conservative Government now stands nobody can tell from day to day, or even from hour to hour, whether this or that member of the Government is a Free Trader or a Protectionist until he gets up in the House of Commons, perhaps in answer to some pressing question, and informs the House what his personal convictions are.

In the debate which was still going on at the time when I began this article there were some most curious illustrations of this strange variety of opinions among members of the same administration. The actual debate arose on a motion made by Mr. John Morley, according to the usual form at the opening of a session, and taking the shape of an amendment to the address in reply to the speech from the Throne, the proposed amendment being, in fact, a reaffirmation of the fidelity of the House to the principles of Free Trade. During that debate Mr. Gerald Balfour, brother of the Prime Minister, and a leading member of the administration, declared absolutely against Mr. Chamberlain and in favor of the principles of Free Trade. So far so good—or, so far so bad—according as each listener's convictions might lead him to put it. But then there arose not long after, in the course of the debate, Mr. Alfred Lyttelton, who holds that very office of Colonial Secretary which Mr. Chamberlain lately resigned, and Mr. Lyttelton declared himself in favor of Protection principles and opposed to the doctrine of Free Trade. Another member of the Government, altho not holding so high a place there as Mr. Lyttelton, proclaimed on his own part just the same convictions. Now, it is quite certain that there are among the political supporters of the Conservative administration in the House of Commons several men of great ability and influence who are open and avowed opponents of Mr. Chamberlain's lately adopted opinions. It must be difficult, indeed, for these men to know whether they ought to count themselves among the supporters or among the opponents of Mr. Balfour's administration. The trouble is made all the greater because

JOHN REDMOND

Mr. Balfour himself has been compelled by severe ill health to absent himself from the House of Commons during this important and almost unprecedented debate. Every one knows that Mr. Balfour is utterly incapable of giving encouragement to any mean stratagems or political dodges on the part of his colleagues, and that if he saw the Government had no fair case to uphold he would never have consented to evade or postpone the free decision of the representative chamber and the country. But in the unavoidable absence of Mr. Balfour every prominent member of the Government is trying to be a leader for himself and to make a party of his own, and the immediate result is the state of bewildering confusion into which the Ministry and the Conservatives generally have recently fallen. When the division came on Mr. Morley's amendment the Government, which has hitherto been able to count on a majority of considerably more than one hundred, found itself reduced to a majority of barely fifty-one, and this majority includes, as a matter of course, all the actual members of the administration who took part in the division and thereby voted for the retention by them of their own offices and salaries. The floundering, therefore, has been going on and the final foundering cannot be far off.

Mr. Chamberlain, as well as Mr. Balfour, has been absent from the whole of this debate. The pushful Joseph has gone to Egypt for the benefit of his health. It has been often and widely suggested that Mr. Chamberlain left the country at this critical juncture merely because he did not wish to exhibit himself as the leader of a movement which some of the recent Parliamentary elections have shown to be utterly out of favor with the very constituencies on which Mr. Chamberlain mainly relied. But I have good reason to believe that Mr. Chamberlain is really in a very serious condition of ill health, and that his removal to a brighter climate for the winter than that of England had become actually necessary for his recovery.

One does not seem somehow to associate so intensely modern a personage as Joseph Chamberlain with the mystic regions of the Nile, with the Pyramids, and the Sphinx. *Punch* has, in fact, this week an amusing cartoon entitled "Joseph in Egypt," which represents the shade of Pharaoh gazing in wonder at Chamberlain in his modern dress, with his glass in his eye and his cigar in his mouth, and the shadow from the dim past utters the words, "Joseph? Joseph? I seem to know the name, but I can't recall your face." Kinglake, in his marvelous "Eothen," has poured forth a passage of thrilling eloquence in which he glorifies the symbolism and the memories of that "stone image," and declares that the veriest modern cynic "dares not mock at the Sphinx." I do not feel quite certain whether Joseph Chamberlain would be likely to be deeply impressed by the nearness of the Sphinx, and I cannot repress a strong suspicion that even while he goes through the tourist's necessary task of gazing on the immortal statue his mind must keep going back to some of the recent elections in England which so unexpectedly proclaimed against his policy.

There can be no question, however, that the absence of Mr. Balfour and Mr.

Chamberlain made the recent debate much wanting in serious interest. On the Opposition side of the House the two most conspicuous successes were made by Mr. Asquith, who once held high office in a Liberal administration, and Mr. John Redmond, leader of the Irish National Party. Mr. Asquith's speech was a brilliant display of blended argument and humor, the humor itself being concentrated argument fancifully put, and the argument, even in its most serious passages, electrified by flashes of humor. Mr Asquith is one of the few practicing barristers who, within my recollection, have won really great distinction as Parliamentary orators, and this latest speech of his has distinctly added to his reputation. Mr. Redmond's speech was admitted by all who heard it to have been one of the most impressive delivered in the House for many years.

Another speaker who made especial mark during the debate on John Morley's amendment was the Hon. F. W. Lambton, whose success is the more welcome because of the historic name which he bears. He belongs to the family of John George Lambton, the celebrated Earl of Durham who may be said without extravagance of phrase to have created the Dominion of Canada. In the early years of Queen Victoria's reign a rebellion broke out in Canada, and when the rising had been suppressed by the British military forces Lord Durham was sent out from England as a sort of temporary dictator to organize some scheme of government which might keep the Canadian provinces loyal to the British Crown. Lord Durham found Canada in a state of utter discontent and disruption. The French provinces were at constant strife with what I may call the English provinces—English—that is, by descent—and the one only bond of sympathy between the two races was their common hatred for the system of government carried on by the British rulers in London. Lord Durham surveyed the whole situation with the eyes of a statesman, with the eyes of a man of genius, and he soon came to the conclusion that Canada could only be kept loyal to the British Crown by granting her a complete system of national self-government. He was able to inspire with his convictions such English statesmen as Lord John Russell, and through such influence the great change was made which endowed Canada with a complete system of what we should now describe as home rule. Since that time, as everybody knows, Canada has been one of the most loyal and prosperous members of the British Imperial system, and the French provinces and the English provinces have lived on perfectly amicable terms. I have always felt a great admiration for the character and career of Lord Durham, and, altho his measures can hardly be said to have gained the approval of the general English public during his lifetime, the results of their operation have long since carried conviction to every reasonable mind at home and abroad. There can be but one feeling of general gratification in this country and in Canada at the Parliamentary success just won by a member of the family to which the statesman belonged who may fairly be said to have founded the Dominion of Canada.

The debates in the House of Commons on the fiscal question, and more lately

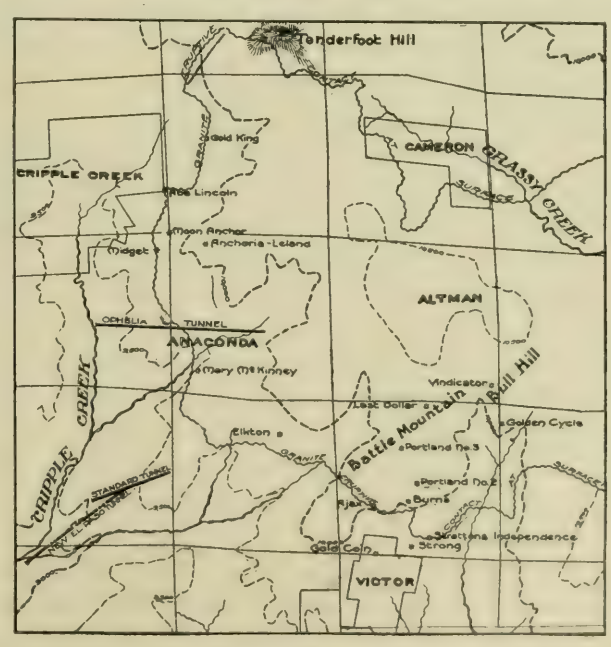
HERBERT HENRY ASQUITH

still on the question of "Chinese cheap labor" in South Africa, have for the time somewhat diverted public attention here from the events of the war between Japan and Russia. Indeed, the events thus far have been but mere preliminaries, and the actual struggle has hardly yet begun. It is curious to observe how the sympathy of the English public has gone almost altogether with the cause of Japan and how nine Englishmen out of ten seem perfectly convinced that Japan must be the victor in the struggle. Of course, it has to be borne in mind that England has a treaty of general alliance with Japan—a treaty which, if Japan were assailed by two Powers at once, would compel England to come to her rescue in arms—and this treaty naturally suggests a sympathy between the two peoples. Why the English people should ever have gone into such an alliance I for one am not able to understand, and it may at any moment become the means of drawing England into a most momentous and widely spreading war. At the present hour, however, the great majority of Englishmen seem to take it for granted that Japan has nothing to do but to sweep the Russian navies off the seas, and then drive the Russians clean out of the Far East. They seem to have forgotten that within the recollection of many of us who are still living Russia held out in the Crimea for more than two years against the combined armies of England, France, Turkey and Sardinia, and peace was only brought about at last because Louis Napoleon, then Emperor of the French, became sick of the whole business and insisted that some conditions of peace must be sought and found.

A movement has just been undertaken by the National Literary Society of Ireland which will, I am sure, be followed with deep interest by my countrymen in America, and, indeed, by all American lovers of genuine poetry. The movement is for the purpose of raising a national memorial in Ireland to the genius of James Clarence Mangan, one of the most gifted and most genuine poetic artists whom Ireland has yet produced. Last year was the centenary of Mangan's birth, and the event gives naturally an impulse to the proposed national tribute to the memory of the poet. The circular issued by the Irish National Literary Society contains some words which will be read with especial interest by Americans. "Not until," these are the words, "America had produced two editions of his poems does Ireland possess even one." Mangan died in the days of my early youth, and I never even saw him, but I knew many of his friends, and his poems were always familiar to me. He had many of the extravagances and follies which at one time used to be considered as the habitual characteristics of genius, but he was a devoted National Irishman and he touched the chords of the Irish National harp with the hand of a genuine minstrel. The movement which is now working out such a splendid success in Ireland for the revival of the Gaelic language and of Ireland's magnificent literature and minstrelsy might well be said to have caught its inspiration from the impulse and the example of Clarence Mangan. I heard a distinguished English author and statesman once say that he did not think any Englishman should ever be appointed Chief Secretary for Ireland who could not prove that he fully understood and appreciated the spirit and the meaning of Mangan's noble poem addressed to his native country under the name of "My Dark Rosaleen." The time has surely come when the Dark Rosaleen should raise some monument to the memory of her dead lover, and I feel sure that such a tribute will have its sympathizers on the American as well as the Irish shores of the Atlantic.

LONDON, ENGLAND.

Cripple Creek—Abe Lincoln Mine in the Foreground



The Great Cripple Creek Strike

BY WILLIAM ENGLISH WALLING

[Mr. Walling is now a resident of the University Settlement in this city. He has recently returned from a visit of investigation in Colorado, where he met prominent men of both parties and is thoroughly informed on the subject. He is a student of labor problems and was a factory inspector in Illinois for a year and a half.—EDITOR.]

THE Western Federation of Miners has unionized nearly every metalliferous mine from Canada to Mexico. It has gathered into its ranks all the workingmen employed about the mines, from engineers and blacksmiths to miners and laborers. It has organized a rival body to the American Federation of Labor, through which it controls all the other unions about the camps—the American Labor Union.

Map of Cripple Creek District

The American Federation of Labor was too slow. When the miners wanted to boycott a store or put a newspaper out of business they did not like to have to go to Washington and wait until the "Gompers Machine" got ready to act. The American Labor Union believes in the power of money as well as the power of numbers. It has accumulated a big "defense fund," which is variously estimated at from one to three million dollars.

This new Federation is composed of "prac-

A General View of the

tical" men—"militant, alert, tireless, persistent," say their enemies, the Mine Owners, "and criminal," they add. But that is the question. The Governor has answered it in the affirmative. Nothing has yet been decided by the courts.

The Federation is unquestionably militant. *The Denver Post* published an article two years ago derogatory to the president of the Telluride union. In three days the paper lost 1,500 subscribers. The writer of the article was discharged. *The Telluride Journal* attacked the Federation. It was boycotted, its advertisers were boycotted, and its editor and owner was driven to the verge of ruin.

The stores in the mining camps have been subject to the Federation's orders. "It was, handle this and don't handle that," they say. This was costly. When the present strike was declared, they decided to free themselves from the yoke. The Citizens' Alliances, with 29,000 members in Denver, Pueblo and the big mining camps, were created for the avowed purpose, among others, of destroying the Federation. The "Western Federation of Miners must go," its President said.

The Mine Owners joined the Alliance, the bankers and lawyers joined it, and non-union men were cordially invited to become members. A large membership guaranteed patronage for the stores, but to make sure of the loyalty of the merchants they and the financial institutions entered into close contracts to resist all dictation from the unions thenceforth. Next, they refused credit to union men on the assumption that the Mine Owners would succeed in "non-unionizing" the industry.

As usual, the Federation was awake. It had seen for some time the up-growth of the Citizens' Alliance, and was ready with its answer. Union co-operative stores were at once started in each of the union camps. The old stores began to underbid. The union poured money into the new enterprises, and they held their customers. The Alliance then got the wholesalers and jobbers of Denver to refuse to sell on credit to the union stores. The stores put their purchases in the hands of an unknown person and bought for cash. They had been in business several months when I visited them in the Cripple Creek district. They are run entirely by the miners themselves.

"We have got enough talent in our ranks," the Secretary of the Federation told me, "to run anything from a barber shop to a bank." The Federation has gathered to itself thousands of adventurous prospectors, who differ from many

Portland Mines, 1903

of the Mine Owners only in that they have not been lucky enough to make a "strike." They come from every social class, every occupation and every section. They are of the most diverse character—from the mere adventurer to the enterprising and hardy pioneer. But they have these things in common: They are Americans, they are of an independent temper, and they have seen something of life and the world. They are not much disposed to take anything for granted, and they don't know the meaning of defeat.

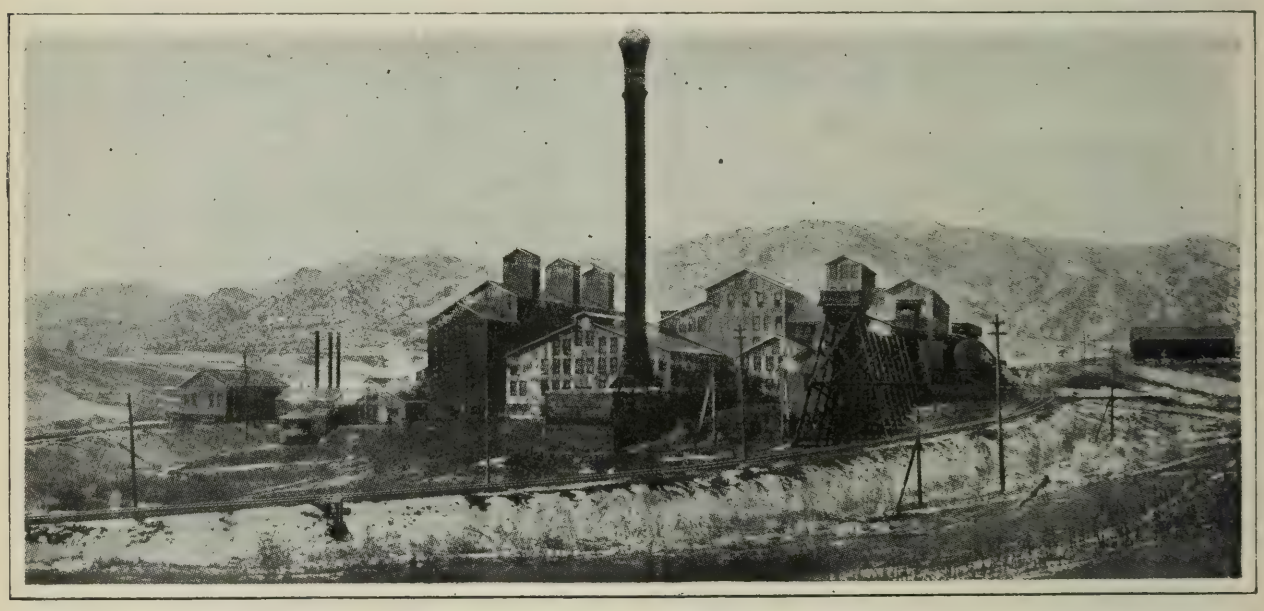
The Federation is governed by an Executive Board that sits occasionally in Denver. It is also governed by referendums and conventions, but most of all, it is governed by a triumvirate of executive officers: Charles H. Moyer, President; John M. O'Neill, Treasurer, and W. D. Haywood, Secretary. Haywood plans, O'Neill writes and Moyer executes.

O'Neill edits the *Miners' Magazine,* that is read weekly in every mining camp of the Rockies. The magazine stands for Socialism first and Unionism afterward —as "an educational force," Mr. O'Neill explained to me. The Federation motto is on the outside cover: "Labor produces all wealth; wealth belongs to the producer thereof." This is also to be found on the back of every union card, "lest we forget," the men explain.

Already the Federation has secured industrial and political control over many of the mining towns. Industrially it has grown strong enough in some cases to exclude non-unionists from the camp. A year or so ago a sign appeared in the mines at Cripple Creek to the effect that the union would not hold itself responsible for scabs that appeared in the mines after that date.

Politically also many of the towns are in the union's hands. Mayors, sheriffs and judges, if not nominated by the unions, owe their election to them. By conviction or interest, their decisions have undoubtedly been friendly. The press in the camps and at Denver was equally well disposed. But when the Federation went against the big corporations at the capital it failed.

A favorite measure for years with the Federation has been an eight-hour law for mines and smelters. Last year they secured, by a majority of 40,000 votes, the adoption of an amendment to the Constitution of Colorado making this measure possible. The political platforms of both parties declared in favor of the proposed law, but through "underground influences," the unions claim, the

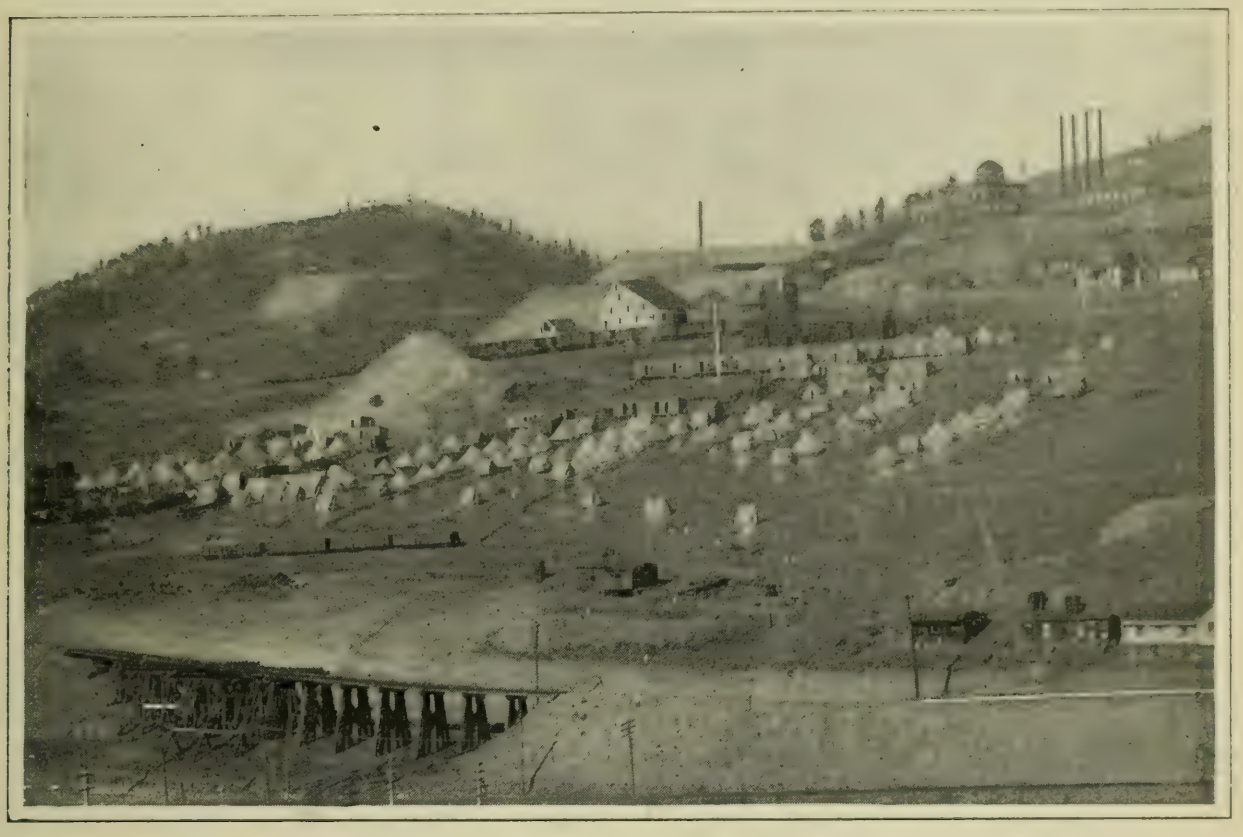


law was not passed. The union then decided on a strike against the Legislature. This would accomplish a double purpose. It would serve as a lesson to enemies of the union and it would unionize the mills and smelters. The industrial power of the union also had been threatened in its citadel at Cripple Creek. Ever since its big victory in 1894 E. A. Coburn, owner of the Ajax and Strong mines, waged war against it. He refused to unionize his mine. But he was compelled to employ union men to complete his force. Among 400 men employed at one time he told me he had 80 unionists. The foreman complained that they were not only restricting their own output, but compelling the non-union men and were forcing them to do the same. "I could do nothing with them," he said "so one day I had all eighty discharged. The output of the mine was greater next day than it had been when these men were at work." This is one way the union fights. In this case it failed.

But with the mines and smelters in the Federation's hands, it would be possible to force the unionization of every mine that shipped to them in the mountain region. Mr. Coburn was the backbone of hostility to the unions at Cripple Creek. If he could be defeated the biggest mining camp in the United States would be completely in the Federation's power. It was a prize worth contending for, for the output of Cripple Creek is more than $20,000,000, two-thirds of the yearly product of the State of Colorado.

But the Federation reckoned without its host. The smelters were controlled by the American Smelting & Refining Company. The strikes in both Denver and Pueblo failed. The largest mills were at Colorado City, and here the unions had better success. The Governor sent the militia to the scene of action, but after continued protest on the part of the citizens and the officers of El Paso County it was recalled. The owners of the largest three mills, the Standard, the Telluride and the Portland, agreed to the shorter working day and promised not to discriminate against union men. The Portland, all agree, kept its contract. But the Standard took the union men back, they claim, only at a lower rate than that at which they went out. The miners then called another strike. But the mill had been filled with non-union men, and they were again threatened with failure.

The Federation had staked everything on this fight. But it could do nothing against the "Open Shop." As a last resort it demanded of the mines at Cripple Creek that they cease shipping to the Standard mill.



"The mill men," they said, "belong to the Western Federation of Miners. We don't work with non-union men."

Portland Mill from the East

The Mine Owners had been anticipating trouble. Under the presidency of Mr. Coburn they were organized and ready for the fight. They refused to close

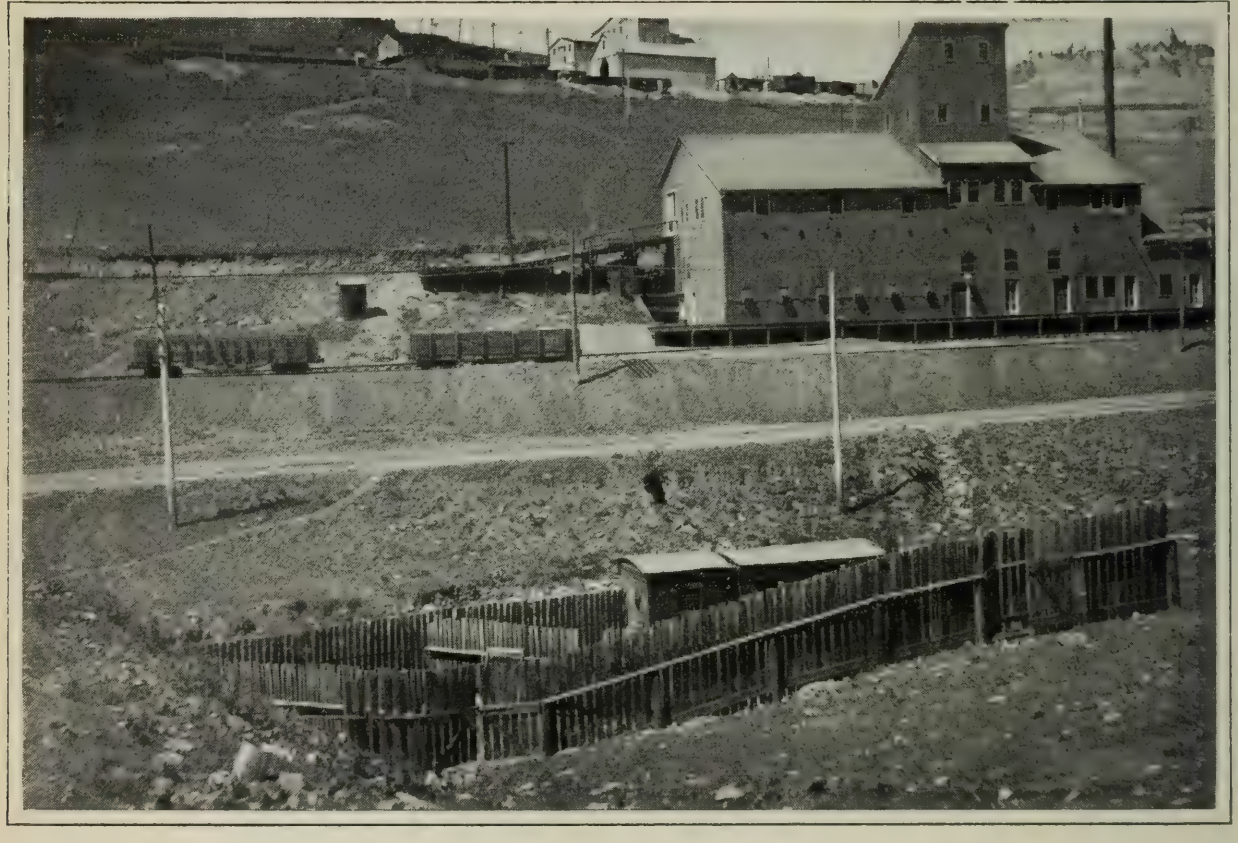
down at the union's bidding, and thereupon 5,000 union miners in the district threw down their tools. The public called it a sympathetic strike, but the Mine Owners say that there was no discontent among the men. There is no question that the employers were the more dissatisfied. Since 1894 the whole camp has been operated on the basis of the agreement of that year made by Governor Waite. In 1894 the miners won a victory. All the usual methods and paraphernalia of the Rocky Mountain strike were employed. Men were warned to leave town by both sides, bull-pens were operated by the Mine Owners, stockades built by the men, sheriffs were employed by one side and militia by the other, radicals on both sides expressing a private preference for vigilance committees and anonymous threats. But there was a difference between that strike and the present one. At that time the Mine Owners controlled the county and the Populists controlled the State, while now the miners control the county and the Republicans govern the State. In 1894 the Mine Owners raised $125,000, armed 1,000 deputy sheriffs and were about to move on the stockade where the men were entrenched. At this point the Governor appeared with militia and the county officers were superseded by those of the State. Governor Waite went first to the union, procured its terms and then proceeded to the Mine Owners. The present agreement was the result. Its terms require laborers to be paid $3 for an eight-hour day and machine men $4 and in some cases more.

Camp Goldfield, Cripple Creek

Ever since this conflict there has been growing discontent among Mine Owners. At the present moment of industrial depression, when stockholders are becoming more clamorous for conservative policies, directors more suspicious of a showy overproduction in the mines, employers are redoubling their efforts to cheapen and increase production. They are met by the union at every turn. Some have been growing desperate.

Now, the strike had not been on long before the merchants and business men became desperate also. In Telluride 80 per cent. of the business of the town had vanished. When the Citizens' Alliance was formed, they flocked into it almost in a body. "We call the Western Federation of Miners the Western Federation of Murderers," the President of the Citizens' Alliance said to me. The tone of the publications that were circulated in

the camp is not dissimilar to that of the *Miners' Magazine*. One of them says:



"The purpose of Moyer and Haywood is to turn Colorado into a hell-hole for Socialism. . . . This dastardly crew is trying to disrupt our entire industrial world. . . . Colorado is a battle-ground. Every citizen in the State is now on one side or the other. The preliminary skirmishing is over, and both armies are lined up for the supreme test of strength."

The Mine Owners and the Citizens' Alliance have uncovered a pretty shady history. During the great strike at Cœur d'Alene, in which a crowd of miners blew up a mine in daylight, and martial law was declared, Governor Steunenberg and the former President of the Federation, Edward Boyce, made a speech, in which he advised every union to have a rifle club, "so that in two years we can hear the inspiring music of the martial tread of 25,000 men in labor's ranks." "It is sometimes necessary to blow up a mine and kill a man or two to secure the recognition of the union," was the comment of the Federation's journal the day after the crime.

This was in 1899. The next trouble broke out in Colorado. Two years ago the non-union night shift in the Smuggler Union mine at Telluride was forced by a body of armed miners to cross the hills at the point of the rifle and leave the county. Several were seriously wounded. It developed that 250 rifles and 50,000 cartridges had been bought from a Denver firm. The order and the draft paying for the supplies were signed by St. John, the president of the union. It was on this occasion that a State Senator sent the Governor this famous dispatch: "No occasion for troops. Mines in peaceable possession of miners."

When I went to the Governor to ask his reasons for declaring martial law in Cripple Creek against the protest of the Sheriff and County Commissioners, he laid emphasis on this past record of the organization. He was especially impressed with an outrage that had occurred about two years before. The Governor had been influenced in declaring martial law rather by the Citizens' Alliance than by the Mine Owners' Association. Himself a banker, he would naturally listen to a plea that had the general support of the banking and business community.

But the Citizens' Alliances have been more radical than the Mine Owners. At Pueblo they woke up the president of the Federation and warned him to leave

Original Bull Pen in the Foreground

1. J. Mullaney. 2. Victor Poole. 3. C. G. Kennison. 4. W. B. Easterly. 5. Sherman Parker. All Were at One Time in the Bull Pen

town before morning. A few days later he returned by the special invitation of the Mayor. At Idaho Springs a mob of Citizens' Alliance members, after the explosion at the Sun and Moon mine, escorted fifteen union men at the point of the rifle outside of the town. It seemed that a lynching was imminent. Every one of these fifteen men has since been exonerated. When new companies were enlisted to serve at the mining camps it was the Citizens' Alliance that furnished the men.

From August, when the militia appeared, to November the strike had no remarkable features. On the 21st of November one of the shafts of the Vindicator mine was blown up and the superintendent and the shift boss lost their lives. About the same time a rail was removed from the track connecting Cripple Creek with Florence. The first train that came along contained militia returning from a ball. But it was signaled and no harm was done. The Mine Owners at once attributed both these deeds to the union. But the coroner's jury found no trace of evidence about the mine. There have been no court proceedings which as yet implicated any one in the attempt of the derailing of the train.

The union, which had previously issued orders for the strict preservation of the law, disclaimed any possible connection with either of these events. They pointed to the fact that such accidents as the explosion were common in the mines. On the same day on which this accident occurred a similar one had taken place at Silverton, which, had it occurred a few minutes later, would have killed a number of men. The superintendent of one of the largest mines assured me that these accidents were in no way out of the ordinary.

The Mine Owners and Citizens' Alliance at once applied to the Governor for a declaration of martial law, and it was granted on the 4th of December. Teller County was declared "in a state of insurrection and rebellion." The Citizens' Alliance had convinced the Governor that the State was in danger of revolutionary disturbances. The past record of the union, or, at least, of its members, and its revolutionary utterances had already aroused him to a state of anxiety and fear. His proclamation shows that he, too, was convinced that the Federation of Miners must go.

"There are in Teller County, Colorado," the proclamation states, "one or

Cage Scene, Anchoria-Leland Mine

more organizations controlled by desperate men who are intimidating civil authorities and setting at defiance the Constitution of the State. . . . These authorities appear to be either unable or unwilling to control or prevent the destruction of property or other acts of violence." The Governor then gives as the immediate cause for the proclamation the fact that certain persons blew up the Vindicator mine, thus denying flatly the evidence of the coroner's jury.

Martial law, not the militia, is the issue in Colorado. Martial law means that property can be taken and persons imprisoned, exiled or even shot without any legal safeguard. A military dictator replaces the administration, the law and the courts. When the militia were put in control they did not delay the exercise of their absolute power. Newspapers were seized and censored, the statements of the Western Federation of Miners were forbidden to be published, houses were searched for arms, saloons were regulated, and in Telluride a curfew law was declared. The offices of the Mayor and Chief of Police were invaded and they were told they must submit themselves to the military. The colonels in command became governors of the military district of Teller and San Miguel counties.

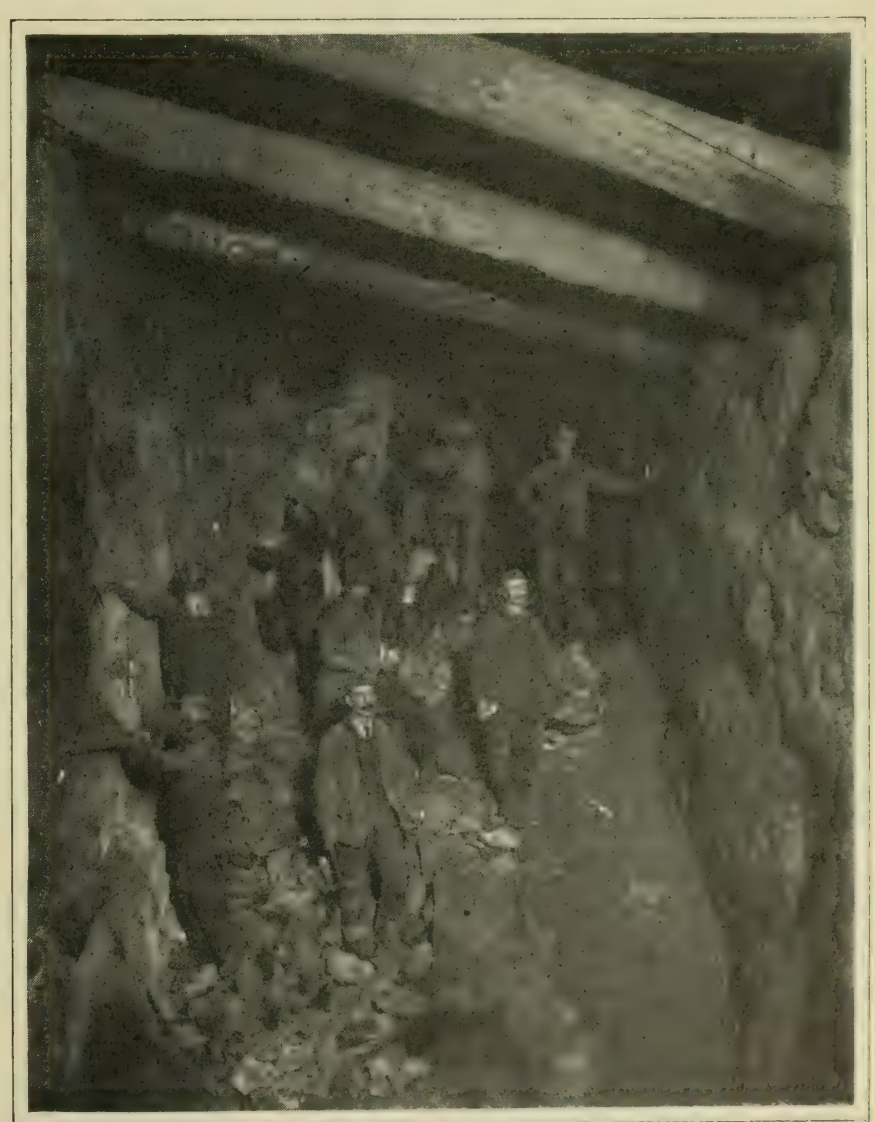
"The militia," said General Chase, "will remain in Cripple Creek until every vestige of unionism is wiped out. Major Naylor explained to me in January the causes 'why we have not yet been able to put an end to the strike.'"

At no time during the trouble at Cripple Creek have there been mobs or riots, and in no case has there been any murder, with the single instance of a certain woman who was killed in a commonplace dance-hall brawl. Outside unionists were forbidden to enter the county, and nearly all the leaders of the strike were arrested without any special evidence as "dangerous persons" and locked up in the bull-pen. Sherman Parker was arrested three times. When his case came up before Judge Hallett of the Federal Court the Judge stated that twice Parker was arrested without any charge being preferred against him and without warrant and due process of law.

At first the men were released by writs of habeas corpus from the Civil Courts. Thereupon the Governor suspended the writ of habeas corpus and the jurisdiction of the Civil Courts was denied. Then came the vagrancy orders and wholesale deportations of union men. All idle men in the two counties were to be deported. Seventy-three men were ex-

iled from Telluride with no criminal charges against them. They are still refused admission into the county. Included in this number are several who are the owners of comfortable homes and others who own wholly or in part mining claims in the camp. James Teller, the Senator's brother, has undertaken their case against the State.

Senators Teller and Patterson have both denounced the Governor's action. Senator Patterson has gone so far as to demand an investigation by Congress. Former Governor Thomas, in a careful and comprehensive letter, says that there was nothing "bordering on insurrection," that the Constitution does not give the executive the power to declare martial law, that martial law when declared is "qualified" only by the will of the military.



"To declare that, because the law is not enforced, we should have no law at all is to deny the possibility of self-government. The results of political elections are uncertain. We may in time have an executive who will take a lesson from present troubles and better the instruction. His soldiers may gore the other ox."

Governor Peabody has paved the way for a political upheaval. The Socialists all over the country take a grim delight in his action. Their chief organ, with a circulation of several hundred thousand, got out a special issue on the "Class War in Colorado," with large imaginary cuts of outrages and bloodshed.

If the unions are going into politics one of the first fields of conflict will be Colorado. Martial law, tho still enforced in Telluride, has been suspended at Cripple Creek. The battle is not over. Some of the largest mines are in operation entirely with non-union men. Employers claim to have won the fight, but the Federation says that the battle is drawn and that time is on its side.

"Every scheme of the Mine Owners," they say, "has failed. Intimidation did not, as was expected, stir up the unions to violence. Arrests of leaders failed to discourage the men, and wholesale deportation did not work."

There is some evidence in support of the miners' claim. Under the added difficulties of operating with the new men some mines have suspended and others have cut down their force. Instead of 5,000, less than 3,000 men are now employed. Of these nearly 1,000 are unionists. There are perhaps 1,500 unemployed unionists in camp. The mines are running at an increased expense; the output has been reduced. The superintendent of the largest mine in the district, the Portland, showed me evidence

At Work in the Slope.

that he was producing with union men at a cost of almost $1 a ton less than his neighbor and rival, Stratton's Independence, which now employs only non-unionists. "We have never had any serious trouble whatever with the unions," the manager and superintendent assured me, "and we find the best workmen are union men." The Portland, with its own union mill at Colorado City, and a controlling interest in the Short-Life, is a thorn in the flesh of the Mine Owners. Whatever the outcome, the situation is ominous. If the mines are again unionized and Governor Peabody defeated, Unionism in Colorado will be stronger and more aggressive than before. If the strike is lost the spirit of discontent and class hatred it has engendered will be a peril to the industrial future of the State.

NEW YORK CITY

Manual Work and Religious Teaching

BY COUNT LEO TOLSTOY

[The following article is part of a letter written by Tolstoy several weeks ago to a friend in Europe. We are glad to have permission to print it.—EDITOR.]

HOWEVER strange and unkind it may seem that I, who live in luxury, allow myself to advise you to continue to live in want, I do it boldly, because I do not doubt for a moment that your life is a good life,—good before your conscience, before God, and, therefore, it is essential and most useful to mankind,—and that my activity, however useful it may seem to some people, loses, I hope not all, but certainly the greatest portion of its significance, through not showing the most important sign of the sincerity of what I preach.

A few days ago a clever and religious American, Bryan, was in my house, and asked me why I consider common manual labor indispensable. I told him that, firstly, it is a sign of sincere recognition of the equality of men; secondly, that it brings us nearer to the majority of the working people, from whom we are fenced off by a wall, if we profit by their need; thirdly, that it gives us the highest bliss and peace of conscience, which no sincere man utilizing the work of slaves has or can ever have.

This is my answer to your first question. Now for the second,—the most difficult of all,—about religious education:

Speaking of education in general, physical as well as mental, I suppose that the most important thing is not to force anything on children; all the more is this necessary when it comes to the most important subject—religious education.

Just as it is useless and harmful to feed a child when it does not want to eat, or to force a child to study subjects which do not interest it, and which are unnecessary to it, so it is even more harmful to teach children religious conceptions about which they do not ask, and in most cases formulate them crudely and thus destroy that religious attitude toward life which at this time may perhaps unconsciously develop and establish itself in the child. All that is necessary, it seems to me, is to answer, but to answer truthfully, the questions asked by a child. It seems very simple to answer truthfully the religious questions of a child.—but in reality only he can do it who has answered to himself truthfully religious questions,—about God, life, death, good and evil, those very questions which children always ask so clearly and definitely.

And here comes true that which I have always thought regarding education, that the essence of educating children consists in educating one's self. However strange that may seem, this education of self is the most powerful tool of the parents' influence over their children. . . .

If you want me to point out more definitely just what books should be given to children for their religious education, I think it is necessary not to confine children to the religious writings of one creed only, but to use together with the Christian doctrinal literature that of the Buddhists, the Brahminists, the Confucianists, and the Hebrews. . . .

YASNAYA POLYANA, RUSSIA.

The Eve of the War

BY ARTHUR LLOYD

[Mr. Lloyd sends us this article from Tokyo. He is especially qualified to write concerning the military situation in the Far East, as he has spent eighteen years in the service of the Japanese Navy.—EDITOR.]

AS these lines are being written no formal declaration of war has been made. With a true sense of the eternal fitness of things, the Japanese Government will postpone the final ceremony until the 11th, and then the declaration will come out with a blare of trumpets on the great day of *Kigen setsu,* the day on which the great Emperor *Jimmu,* the first of our long line of sovereigns, ascended the throne B. C. 620, and the day on which, some fifteen years ago, his present Majesty granted a constitution to his loving subjects.

We are not formally at war, and yet only ten minutes ago I bought in the street an extra issued by a Japanese paper announcing the safe arrival at Sasebo of two captured transports, and the shutting up in the harbor of Chemulpo of two Russian cruisers, the *Rurïk* and the *Korietz.* Whether this information is worth the paper on which it is printed or not is more than I would venture to say. Some Japanese sheets are notoriously untrustworthy at all times, and the press censorship is so strict just now that nothing of importance is allowed to transpire; but at any rate the fact that the vendors of news are hawking such news about the streets shows that, whether declared or not, war has come, and to stay.

We in Tokyo see and hear very little about the military preparations, and yet the air is full of bustle and excitement. The greater part of the military and naval preparations was begun many months ago. Japan has had this war in her eye for many years, ever since the moment when Russian influence, backed by France and Germany, compelled her to acquiesce in the retrocession to China of the Liao-tung Peninsula, which she had taken to herself as the fruits of victory. As soon as it began to be evident that Russia did not intend to move out of Manchuria without being forced to do so, the preparations were pushed on with greater vigor, and I remember quite distinctly one day a year and a half ago when I found a back gate through which I could get a short cut to my work at the Naval Academy shut in my face. I thought at the time that it was a piece of vexatious red-tape, but as a matter of fact the short cut took me through a portion of an arsenal yard, where things were going on which it was not good for the alien to see.

The consequence of all this preparation has been that Japan has been ready long since, and the danger has been, not that the war would find the nation unprepared, but that the long waiting for the war after the preparations had been finished might make the troops, and especially the navy, tired and stale.

To-day Japan is reaping the benefit of her far-seeing precautions. There is no noise, no confusion, no bustle. Weeks ago the Tokyo garrison was sent forward to Hiroshima for embarkation. No one knew of it. The passenger service of the trains was not deranged in the least; a few persons whose houses happened to lie in that direction were awakened by the unwonted whistling of railway engines at midnight, but that has been all. The Tokyo garrison went, and its place has been taken by the garrisons from Sendai and Chiba, but nothing has appeared on the surface. And now they have gone and the reservists are being called in to take their places, but on the surface of things there is no sign of Japan's being conscious of the tremendous effort she is making to grapple with her foe. You see here and there groups of country people accompanying a friend or companion as far as the barrack-gates, and there are a good many undemonstrative farewells going on at the stations, but no one who did not know could possibly guess from the demeanor of the people that anything great or out of the common was on foot.

When we hear from across the China seas of the unprepared state of the Russian military authorities, of the confusion that is said to reign at Port Arthur, and the hopeless congestion of the Siberian Railway, we feel that Japan has one element in her favor. She has learned the value of timely and intelligent prepara-

tion; she knows what she wants to do, and how to do it, and she has all the materials to hand to do it with.

There is no great elation among the people, but neither is there anything at all like dejection. They all feel that they are attacking a big problem, the solution of which is very uncertain, and that in the first line the victory depends largely upon themselves. They know, too, that while failure may be fraught with national ruin, success means no longer the entry of Japan into the comity of civilized nations, but the entry of Japan into the inner circle of the two or three world Powers. They know that the eyes of the world are upon them, and they mean to do well.

I have noticed, however, that the nation seems sobered and solemnized. It is true that at Sasebo in the days of waiting there was, I hear, a good deal of festivity going on among the officers of the fleet; but that was probably done on purpose to prevent officers and men from getting stale and weary. But otherwise I know that there has been a feeling of great solemnity. I passed a heathen shrine this morning crowded with worshipers—a rare sight usually except on festivals; and a bookseller in the city told me that his firm expected quite a run on religious books.

There was a similar phenomenon nine or ten years ago, when the nation first went to war with China. At that time there was a strong tide of favor running toward the Contemplative or Zen sects of Buddhists, and hundreds of men of all classes, especially the upper, were to be found practicing the methods of contemplation prescribed by the sect. *Zazen,* as it is called in Japanese, is a peculiar form of meditation supposed to be most efficacious in producing a strong and vigorous soul. Those who practice it go into retreat for a week or so and fast with considerable vigor. After the morning devotions they all assemble in a room and receive from the conductor of the retreat a theme on which to meditate, or, rather, a conundrum to be solved by meditation. During meditation they sit on the floor in a posture impossible for an elderly gentleman with stiff joints and a certain rotundity of figure, and when they have found the answer to the problem propounded to them they go and communicate it in a whisper to the director, who then either gives them a fresh subject or sends them back for further meditation. The retreat goes on for a week or so, but one can retire at any time.

This *zazen* became very popular during the late war, and there is a tendency now toward increased religious observances. I take it as a good sign; it shows that the nation is going in for the war in no spirit of levity.

All Japan has watched with the keenest of interest the gradual approach of the two new cruisers which were bought in Italy a few weeks ago. They are being brought out by crews of English and Italian officers and sailors, with just two or three Japanese officers on each vessel. Yokosuka, the naval port, Yokohama and Tokyo are all eagerly preparing to give these men a good reception, and certainly, if they succeed in getting the ships safely through, they will have earned the nation's gratitude.

The Japanese have been much touched by the many manifestations of good will that have come to them from the people of the United States. From us Englishmen they felt that they had every right to expect sympathy, for the English are their allies, and they are in a sense fighting the Englishman's battle for him. But the Americans have had no special need for showing their good will, nothing but the spontaneous promptings of hearts that have always beaten warmly for Japan, and the Japanese have long felt an especial gratitude for the nation that first introduced them to modern society.

I understand that Baron Kaneko is shortly going to the United States on a business errand for the Government. Certainly this country could not be better represented, for the Baron is a distinguished graduate of a leading American university and a special lover of the United States. Count Okuma, too, is, I hear, preparing a pamphlet for presentation at the St. Louis Exposition. Its particular purpose is to celebrate duly the fiftieth anniversary of the first treaty that Japan signed with a foreign nation. Who would have thought fifty years ago that the secluded nation of that day would in half a century be standing up for a single handed fight against the giant Russia?

TOKYO, JAPAN.

Music, Art and Drama

The Whistler Exhibition

The James McNeill Whistler Memorial Loan Exhibition, now being held in Boston during the four weeks beginning February 24th, is the most important art exhibit in the United States during the present year. It is located in Copley Hall, the home of the Copley Society.

The interest taken by the general public is unmistakable, and confined to no locality. At the private view held on the evening of February 23d the halls were crowded. Naturally, Bostonians largely predominated. But from the groups around the more important pictures the attentive ear could catch voices whose accents told of birthplace in New York, Baltimore, Philadelphia, Detroit—some perchance in the rapid French of Montreal—a true gathering of art-lovers, without regard to *habitat*.

Could Whistler but have visited the hall that evening he must have been deeply touched by the reverent spirit which dictated the harmonious setting of so large a part of his truest lifework. Over the two main entrances are the temple ramma given by Mr. Bunkio Matsuki for this occasion. The exhibition walls have been lined wtih Russia crash or grass cloth, which lie under the soft electric lights in a nocturne of gray silver and set in advance the tone, the atmosphere, in the coloring which the artist loved so well.

Down the center a double row of bay trees gives the needful touch of strength and contrast. On the walls are grouped a surprisingly large number of paintings, water-colors, pastels, etchings and drawings—four hundred and ninety-nine, all told—gathered from many cities, and comprising a representative collection of his works. Many of them have been borrowed for the purpose from friends beyond the Atlantic—in London and Paris; and we may remark, in passing, that the United States Government exacted tribute on the frames that encased them!

As one enters the central hall between the lines of bay trees, the glory of the "Princesse du Pays de Porcelaine," directly facing the entrance, challenges instant attention—a full-length figure, decoratively planned in Japanese style, rich in Oriental costume and splendor of coloring. It dominates the entire hall, altho occupied also by a number of celebrated portraits. The temporary wall behind it shuts off the stage from the main hall, forming a gold-hung room devoted to the lithographs, which are here in great number, including many studies from the nude, and delicately touched sketches of bridge and other architecture, which give an airy daintiness to the color scheme as compared with the more somber tint of the long lines of figures in the outer hall.

One wall of the main hall is largely given up to nocturnes. The "Fur

Perspective of East River Bridges, by H. F. Hornbostle. In the Exhibition of the Architectural League

Jacket," which was exhibited at the World's Fair in Chicago, is also here; the famous "White Girl," first seen in the Salon des Refuses in Paris; the full-length portrait of Señor Sarasate, holding his violin, and a number of wonderful marines. But it is safe to say that the nocturnes most sharply hold the attention of every one who passes within their range, from the world-famous "Nocturne in Black and White" (showing the fireworks at Cremorne) which led the author of "The Gentle Art of Making Enemies" to lock horns with Ruskin in a libel suit and win one farthing as damages, to the exquisite little "Westminster," before which the unsophisticated lingers in blank wonder at the blank surface, suddenly to find the dim, shadowy form of the building growing out of the dusk till it stands mistily perfect in sky and reflection in the silent water through the somber night. It will be well for each visitor to study this little picture for himself whether it has or has not a world-wide name.

To many a one this exhibition will prove a revelation. He will have been familiar enough with Whistler's somewhat eccentric personality, of course, and with his works in black and white. He will have read that the artist freely sacrificed freshness of color to harmony of tone, with his palette ever set in the scheme of black, brown and gray; and perhaps till now he has mildly wondered why this artist should have roused such enthusiasm and fury in two opposing camps. But here, grouped in this memorial exhibition in the land of Whistler's birth—indeed, within forty miles of his birthplace—the student finds proofs that would well-nigh convince the blind, demonstrating that this artist of antagonisms was also a master of color, making it reveal to the uttermost his thought, clearly distinct. There is nothing uncertain. It is the direct, dominant note of a master who is sure of himself, who had his own message to the world, and troubled himself little, therefore, as to the ideas of others, confident that he will find in due time his own exclusive niche in the Hall of Fame.

The Architectural League

The annual exhibition of the Architectural League is the most educative art event of the year. It not only allows us to see what the building public orders, but sometimes what the building public

Pioneer Seeking Shelter. Solon Berglum. In the Exhibition of the Architectural League

Figure by C. Y. Harvey for Liberal Arts Building, St. Louis Exposition

rejects, in spite of architects' preferences, perhaps. It shows us freely designed works with which a conservative public will have little sympathy, tho these are often the things of real promise, and it shows, above all—especially this year—the patriotic dreams of the artist class for the beautifying of our still very crude cities. The persistence of these dreams in time accomplishes their hopes in some measure, and the number of projects for remodeling cities or institutions that are this year in a fair way of being carried out is remarkable and represents the vital note of the exhibition. Most significant among these is the set of plans by Burnham, Carrére and Brunner for a civic center in Cleveland, Ohio, which creates a setting of much possibility for beauty for the public buildings and even brings the railroad into the scheme in a way that combines the utilitarian and the beautiful to the confusion of the Grouts of the day. A plan for the remodeling of the region about the City Hall in New York obliterates that gray incubus, the present Post Office, and places a massive and lofty campanile at the entrance to Brooklyn Bridge. A beautiful water-gate to the Borough of Richmond is one of the things the future may give. Carrére and Hastings have a design ready. The great series of bridges across the East River is interestingly shown, both in the bird's-eye drawing by Hornbostle, who is their architect, and in the little models. The two not yet opened have more beauty than the Manhattan Bridge. The West Point plans are the work of several firms of architects, and are especially interesting in showing the present awakening to the possibilities of landscape architecture in conjunction with noble buildings on a site of great natural beauty. The riding-hall is an impressive mass. Annapolis, too, tho less fortunate in situation, has had its reconstruction beautifully planned.

Seventeen exhibits give a pleasing foretaste of some features of our new Subway. The designs are for name tablets and station ornaments by Heins and Lafarge, carried out in fine, strong colored pottery of dull glaze by the Rookwood and Grueby Potteries and the American Encaustic Tiling Company. It is a hopeful sign of better things when we are allowed to escape from the blue and white enameled iron station signs.

Visitors ignorant of the processes of

the arts are most interested, naturally, in the more finished renderings of buildings, windows, decorations, &c., which make up the largest part of the exhibition, altho these are often actually less important than some things that here appear merely as first rough sketches of ideas. Composition may be judged in these—in a statue, a pediment, a garden or a frieze, but all the other qualities that finally count in a work of art are merely suggested, what the artist has to say of beauty being most successfully said spontaneously in the final work itself. Mr. Ward's pediment group for the Stock Exchange ought to be an epoch-making work; that it is not is not entirely proved by the model shown this year. The small models of several figures for the Louisiana Purchase Exposition constitute almost the only reminders in the collection of works of the near approach of that festival. The most serious and lovingly handled work among them is a figure for the Liberal Arts Building by C. Y. Harvey, very sculpturally expressed even in the little model. "The Pioneer Seeking Shelter," by Solon Borglum, is also a fine plastic group.

The largest window design shown is a black and white cartoon for a tall five-light window, in which Robert Reid has worked out as good a composition as windows of this unfortunate, large-figured type may have. Burrough's window for the Newark High School is the least interesting thing he has done in some years.

Country houses in America are growing larger year by year, and in being constructed of stone in increasing numbers get closer in type to English manor houses. Our gardens, however, are all more French and Italian than English, but, like the houses, are greater in extent and more exquisite in detail than ever.

Renwick's design for the Lady Chapel that takes the place of the apse on St. Patrick's Cathedral is unfortunate and will apparently injure that structure's semblance of good Gothic by the introduction of a third spire at an unusually unfit point.

A New Moralist in Art

Tucked away in the little East Gallery at the Architectural League were six black-and-white drawings of a kind belonging to none of the regular departments of work shown there. Decorative they all were, but done not at all for use in any specific field of decoration, but very evidently for pure need of expression in a medium very intensely enjoyed. These drawings were the first works exhibited by Herbert E. Crowley, a young man whose art training has been all musical, but who has drawn all his life "for fun." Two of his remarkable compositions were frieze designs, showing an intimacy with the rythms possible in black and white spotting, with, in one, a certain element of unconscious humor in the very idea of a graceful use of the irresistible pelican. To use fishes in graceful wave motion is comparatively easy, but to use the pelican's grotesque features in a suave design requires a wonderful belief that "the possibilities of things exceed the possibilities of thought," and that is just what Crowley apparently has. Several men of the

Decoration Introducing Pelican Motif. Herbert E. Crowley

decorative illustration school might have done the "Frieze of Fishes" and the "Frieze of Pelicans," but it is difficult to think of any other man who could have produced the other four drawings. A few Englishmen—Patten-Wilson, for one—have something of the kind of creative imagination shown here; it is in a sense archaistic; it is the seeing of things under stress of an attitude of mind. But Crowley's attitude is profoundly serious, not whimsical as Wilson's, or attenuatedly delicate as Beardsley's. There is much of a vigorous energy in these drawings.

Most like Beardsley in the telling value of every line is "Scandal," an upright panel with frieze and dado above and below and invention in every pen stroke. "Scandal" is a horror with a horned, baboonlike head, a swollen belly, and legs as bare of muscle as an ostrich's; from her weak mouth issue bubbles of froth; her position in space is as uncomfortable and unrestful as thorny motives can make it, yet all reduced to an orderly composition in which each detail is wonderfully drawn by itself. The extended feet rest upon a lattice of spiky interlacings; a tree around which a serpent coils balances the figure; and a lattice of thistle forms makes a background into which is worked the pattern of a cross in black, doubtless carrying some meaning. Above the panel is a frieze of masks and flowers in a wonderful mass effect. The lower panel is the least successful part of the design. On a background of thistle stalks are two heads, ineffectual as types or masses, with a snake writhing about them.

"The Temple of Mysteries" is awe-inspiring. Steps and walks and gates in carefully drawn perspective lead the eye to a dome buried among trees that suggest an illimitable forest. The air is deathlike, but a tall, pensive bird in a pool that makes the foreground seems to add just the relieving note of whimsy. Not a leaf in the picture is repeated, yet each in itself is beautiful, tho treated in such a way that it helps on the weirdness of the idea.

"Rye" is the least decorative in idea and management. The embodied Evil of Intemperance is a bestial creature covered with hair. He holds aloft a bundle of rye. Behind him Delirium Tremens writhes in a mass that would suggest that the world is full of nothing but such monstrous movement, were it not for the rising sun in the top of the picture.

An unfinished drawing, which will work into the best of them all shows the devil on a projecting cornice placing a new evil in the scheme of things. No description can give much idea of this work. The mind behind it is that of an artist played upon by every spot and curve in a leaf or a shadow, in nature or in the mind. He thinks like William Blake, it may be supposed, but his actual

power as a modern draftsman is amazing in a beginner. Such a feeling as his for the third dimension in space filling is expressive of a quality of mind much more rare than his present acquirements in technic.

The Drama

The most interesting dramatic event of the past month has been the production of "Twelfth Night" in the Elizabethan manner, under the same management as that which produced the medieval play of "Everyman" a year or so ago. The play is produced on a set stage, without any change of scenery, and with all the simplicity of the Elizabethan age. It is in the main very well acted, particularly the part of "Viola" by Miss Matthison. The part, of course, is one that has always been a favorite with some of the greatest actresses, such as Adelaide Neilson, Ellen Terry and Ada Rehan. Miss Matthison is not their equal, but her acting in the part is intelligent and attractive throughout. The production of the play in the simple manner of the time of Shakespeare, tho the effect is quite archaic, is, in an unusual degree, interesting to any one fond of the poetry of Shakespeare or of the other writers of the spacious times of great Elizabeth.

Richard Mansfield is a good actor and a manager with high aims. He always produces intellectual plays in an artistic manner. He has opened a season in New York with "Ivan the Terrible," a play by A. Tolstoy, not Leo Tolstoy. It is long, diffuse, and overcrowded with characters, but it is, in places, powerful and impressive, and is throughout historically interesting. The part of "Ivan" as acted by Mansfield reminds one inevitably of Irving's "Louis XI." The picture of a senile tyrant, dominated alternately by bloody ferocity and cringing superstition, is effective, dramatically, tho the general impression at the end of an evening devoted to such a revolting exhibition of human nature is wearisome. But, upon the whole, the play, as a fine historical picture of a

Twelfth Night, Act III, Scene IV.—The "Duel" Between Viola and Sir Andrew Ague-cheek

strange barbaric king and a strange barbaric epoch, is well worth seeing.

For a number of years the Murray Hill Theater has been the only one in the city producing good plays, well acted, where the price of admission is cheap. The management has uniformly pursued the policy of bringing out, not necessarily new plays, but thoroughly good and well-known plays, and of making frequent changes in the bill. For instance, in the last month the Murray Hill Theater has presented Pinero's "The Gay Lord Quex," and "Trelawney of the Wells," and Esmond's "When We Were Twenty-One," which are among the best of recent English comedies. Each was played for a week. All things considered, the Murray Hill Theater gives the best entertainment for the money of any place in New York, and is entitled to particularly high praise for the character of the plays produced there.

Among new plays recently produced "The Pit" is one which seems to be drawing large audiences, principally made up of curbstone brokers and visitors from the rural parts of the West. It is well named. It is not entirely bottomless, but it is deep enough. There is a great crowd of actors, who are expensively dressed, but the general effect of the entire production is commonplace and mediocre. About the same may be said of Augustus Thomas's comedy, "The Other Girl." This play, like "The Pit," has nothing actually bad about it, but it is inherently dull and uninteresting. "Glittering Gloria" is coarse horseplay, but at times is rather funny horseplay. It has an unusually good song by a luggage master in praise of his sweetheart, the chorus being sung to her through a telephone.

"The Younger Mrs. Parling," as produced at the Garrick Theater with Annie Russell as the star, is a rather novel modification of the "problem" play. It is founded upon Henri Bernstein's "L'Detour." The dialog is clever and the plot is well worked up. The climax comes without violence and is effective. Mr. John Mason as James Parling was fully up to his former achievements. Some very excellent work was also done by Miss Olive Murray as Susan Parling. The play was notable from the fact that Mrs. Gilbert appeared as a member of the caste. Mrs. Gilbert is the oldest surviving actress that we have, and has always been an honor to the profession. Her work in "The Younger Mrs. Parling" was characterized by the highest art. The play, on the whole, is above the average in interest and in action, but it is a question whether it is to be recommended.

Strauss

Last year some enthusiastic admirers of Richard Strauss arranged a festival in London at which all his more important works—mostly symphonic poems—were produced. It was not a success financially, but it led to the writing of many articles and thus helped to advertise further a musician whose name has been more prominent of late than that of any other German composer.

The plan adopted by the Philharmonic Society of New York of importing half a dozen famous foreign conductors for its concerts this season gave an opportunity of bringing over Richard Strauss, too. Naturally enough, his admirers seized this opportunity for arranging a Strauss festival similar to that held in London. That these admirers are numerous was shown by the size of the audience which attended the last of the Wetzler concerts, on February 27th, at which Dr. Strauss made his American *début*. Mr. Wetzler opened the proceedings by giving an excellent performance of Strauss's bombastic, metaphysical tone-poem, "Thus Spake Zarathustra." The musicians knew that the composer was listening and they played as they never had played before.

The applause which followed was responded to by Dr. Strauss himself. As he came on the stage the orchestra received him with a noisy fanfare, and the audience applauded frantically. When quiet had been restored, Mr. David Bispham sang three Strauss songs, and then came the great event of the evening—the event for which the audience had chiefly assembled—the conducting by Strauss himself of his symphonic poem, "Ein Heldenleben." There are some who consider this a master-work—a page of musical autobiography as great in its way as Siegfried's story of his life as told by him in "Götterdämmerung." Others hold it to be a bombastic, noisy, cacopho-

nious effusion, which marks the limit of human tolerance in the line of musical ugliness.

Whatever the truth may be, it was certainly interesting to see and hear this famous composer conduct one of his latest works. Strauss is only forty years old. He looks slender, almost fragile. But when he conducts there is no trace of weakness. His beat is firm, decisive, commanding; he knows what effects he wants, and he gets them. At the same time there is something incongruous, almost grotesque, in the contrast presented by this frail-looking young man and his colossal tone-poems, in which the orchestral sounds rise and surge and tumble over one another like the waves of the stormy ocean.

Felix Weingartner

On February 12th this celebrated conductor and composer from Munich appeared in New York in connection with the Philharmonic Society and, with an eerie quietude of manner reminiscent of Sherlock Holmes, produced a sensation. Weingartner is not the greatest of conductors. Arthur Nikisch, Theodore Thomas, Gustave Kozel, all have something to teach him. But he seems to be the one man who might undertake the successful leadership of such a spoiled body of musicians as the Philharmonic. On a recent and memorable occasion he dominated the orchestra in a manner as potent as it was different from that of all other conductors. From his tall, reserved and military figure a unique and mysterious influence issued. And it would be difficult to explain his ascendency by any theory other than that of hypnotism.

Souriau has written a bulky and persuasive volume on the hypnotic power of art—especially that of music. Could he have seen Weingartner with the Philharmonic he might have secured material for an appendix, for the Munich conductor appeared singularly like a man in a self-induced semi-hypnotic trance. His features were set, his eyes wild and staring, his body rigid. His beat, angular and often spasmodic, showed the effect of extreme muscular tension, and a compelling subjective influence seemed to radiate from him as from a human light house. He conducted without score and with remarkably little physical motion, ostensibly relying more upon his gamut of facial expression and a deaf and dumb language of the left hand than upon his baton. His demoniacal and effective glare at a recalcitrant horn or at a catarrhal bassoon filled those auditors with joy who occupied front seats on either side. And loud and fervent were the wishes that he might continue to hypnotize New York musicians. He conducted as one having authority and not as the scribes. His technic is brilliant, and he makes up in beauty, restraint and richness what he lacks in melodic originality.

The Opera

Except for a performance of the Nibelung operas and a second cycle in April, when "Parsifal" also will have one more performance (the twelfth), the season of grand opera at the Metropolitan has come to a close. The last weeks were largely devoted to French operas; but whereas "Carmen," with the incomparable Calvé, proved as great an attraction as ever, Mme. Aïno Ackté, of the Paris Grand Opera, did not succeed in attracting good audiences. She is considered by some a clever actress, but her voice chills where it should warm. The Parisians admire her, and one indignant Frenchman is reported to have declared that her art is too fine to be appreciated by Americans. The operas produced during the early part of this season were rendered in a style of the highest excellence, and very hearty commendation has been given by us to the management in previous articles this winter. The operas now produced there by the singers who were engaged in the early part of the season are still admirably rendered, but some operas have recently been given with artists new to the New York stage who are quite unworthy of the high reputation of the house. Gounod's beautiful and popular operas of "Faust" and "Romeo and Juliet" probably never were as poorly rendered at the Metropolitan Opera House as they have been recently. Hardly a singer in the cast, with the exception of Plançon, did tolerable work.

Literature

Sabatier's Religions of Authority

ACCORDING to Sabatier* there are two types of religion in the Christian Church, the religion of authority and the religion of the spirit. Of the religion of authority again there are also two types, the authority of the Church and the authority of a Book. The former is the Roman type of authority; the latter is the Protestant type. The Roman dogma is first traced from its beginnings in the early ages to its completion in the infallibility of the Pope, and is subjected to keen historic criticism. The Protestant dogma of authority is next traced through the doctrine of Scripture, and its varying fortunes with historical criticism are described. The infallible Book fares no better than the infallible Church. Both are shown to be baseless. This part of the work contains nothing new for scholars, but it is an excellent exposition for those who are not experts. After this comes the exposition of the religion of the spirit. This also contains much valuable matter.

From the standpoint of vigorous criticism, however, Sabatier can hardly be called perfectly clear in his own thought. He says, quoting from Vinet, "That which I absolutely repudiate is authority." This elsewhere appears as "external infallible authority." Much of the time the polemic is against infallibilism; and infallibilism seems to be the meaning of authority. He claims that there can be no authority, at least no "dogmatic authority," without infallibility; altho fallible persons, as Moses, Isaiah, Paul, "are and will continue to be, in the religious order, men of God clothed with a very great moral authority."

Now there may be places and persons for whom this polemic against "dogmatic authority" may be needed, but it seems to us somewhat antiquated for Protestant scholars, and the discussion from lack of discrimination sometimes fails to connect with reality and loses itself in barren polemic. Of the necessity of authority in some sense in the human world there can be no question. The individual, both from the form of his development and the limitation of his powers, must depend on authority as a matter of course in religion and everything else. There is a very large field and a very important function for authority in human affairs, and there always will be. If the author had devoted less attention to "dogmatic authority" and more to the necessary function of authority in human development he might well have produced a more valuable work.

This whole subject of authority has been confused by abstract treatment, instead of looking at the concrete facts. Thus it is asked, What is the final seat of authority in religion? Is it the Church, or the Bible, or the human reason and conscience? And it is supposed that it must be one or another of these, whereas in point of fact no one of them alone is the seat of authority, but all working together in the actual religious life of men, and each in any living community depends on the others. Neither Church nor Bible can forever overcome reason and conscience; and both reason and conscience must admit that Church and Bible have had much to do with their development and insight. Martineau in his weakest work, "The Seat of Authority in Religion," falls into this error of academic abstraction, and Sabatier does not escape it. The truth is that these several factors have only the authority they can persuade us to accord them, so that we living men have to locate the authority, after all. Moreover, this question of authority is really secondary in any case. The real question is the psychological question of certainty; and this is a matter of life and immediate contact with the facts, and not a subject of academic reflections or formal logical exercitations. After we

* RELICIONS OF AUTHORITY AND THE RELIGION OF THE SPIRIT. *By Auguste Sabatier.* New York: McClure, Phillips & Co. $2.50.

have attained this certainty we may talk about authority, but the certainty is first and founds the authority.

In expounding the religion of the spirit, Sabatier mainly reproduces the positions of Ritschl. Of course, faith is distinguished from belief, and religion is made independent of theology. Here, too, many important half truths are set forth which are valuable as reactions against a dry intellectualism and a barren theologizing, such as the following, which we take from an ancient work: "Theology teaches that there are in God one Essence, two Processions, three Persons, four Relations, five Notions, the Circuminsession, which the Greeks call Perichoresis." Of course, religion is independent of such theology, but to make it independent of all theology is to declare that it has nothing for intelligence. In this matter Sabatier is less pronounced than other disciples of the school, showing that the reaction has already set in. Of course, as always happens with repudiators of metaphysics, there is a deal of implicit metaphysics, much of it open to suspicion. As a whole, however, the work is stimulating and suggestive, and is to be commended to all who are seeking to orient themselves in this field.

The Creevey Papers

THE world will never know much about Thomas Creevey, but *The Creevey Papers** will take a not insignificant place among the materials for the history of England during one of its most important periods—that of the Peninsular War, the scandals connected with George IV and his unfortunate wife, the Catholic Emancipation and the Parliamentary Reform of 1832.

Thomas Creevey was born at Liverpool in March, 1768, of Irish parents, according to his own statement; was educated at a grammar school and the University of Cambridge, and studied law at Gray's Inn, London. In 1802 he was returned to Parliament for the borough of Thetford, the representation of which, according to the corrupt custom of the time, was in the gift of the Duke of Norfolk. In the same year he married a widow with a moderate property, and entered upon a career of Parliamentary and social life, in which he evidently was a favorite with a wide circle of persons ranging from royalty downward. The death of his wife, in 1818, and the consequent loss of income, except some $1,000 a year, in no way lessened his social prestige, but he retained the highest in the land as associates and friends until the beginning of 1838, when he unobtrusively passed away.

The Papers consist of letters received from eminent members of the Whig Party, from fellow-members of Parliament, from ladies of rank and fashion; letters written to a favorite stepdaughter, and extracts from a diary. Greville, in his memoirs, seems to be mystified about Creevey's retention of the favor and society of his powerful friends, seeing that he was without wealth or aristocratic claims, but on reading these volumes the mystery disappears. In social life Mr. Creevey evidently showed a strong individuality; altho an arrant gossip and a keen searcher after news, not excepting spicy scandal, he was "truth itself" (i. 237, note); the tender relations between himself and members of his family prove him to have been of a genial temperament; he possessed a caustic wit and great powers of retailing anecdotes, not hesitating to pit himself against the renowned Sydney Smith; he could make amusing verses upon public characters (i. 296); and Lord Melbourne considered him shrewd. Such a man would be hailed as a good companion in an age when fashion prided itself upon its "wit." It is from the point of view of such a one that we have this picture of political and social life in England nearly a century ago.

At first he was willing to follow the lead of Charles James Fox, for whom he had an almost servile admiration, while for Pitt no vituperation was too severe. After he joined the extremists who adopted the ominous name of The Mountain, even the Whigs were fair game, and were assailed vigorously.

* THE CREEVEY PAPERS. *A Selection from the Correspondence and Diaries of the Late Thomas Creevey, M. P. Edited by Sir Herbert Maxwell.* Two volumes. New York: E. P. Dutton & Co. 1903.

Altho at first he associated with Brougham and became his confidant, he soon distrusted him; but, being astute enough to conceal his feeling, he became the repository of many things which, in after years, Brougham regretted having disclosed.

In addition to the political matter there is abundance of description of social life which, with its scheming, its scandals, its drinking and gambling habits, is not inspiring. The picture, however, is a true one, as many a record tells. Fielding and Smollett had been dead about half a century, but the life they depicted in "Tom Jones," "Roderick Random," and even in "Ferdinand, Count Fathom," was still the fashion.

"Style" must not be expected in the volumes. Few of the letters are models of even epistolary English. The spelling is rightly left in the chaotic state which characterized the orthography of the period. Expletives abound, as was the fashion of the times; and, were it not for the many footnotes, which are repeated as often as necessary, readers would not recognize famous personages, even royal ones, under their nicknames. The editor has wisely let Mr. Creevey tell his own story, confining himself to selecting the material and supplying some connecting links. This is well done. There are many well executed portraits, some from famous paintings; and, taken all in all, it would be difficult to find a more entertaining recent work.

A Keystone of Empire

It is a mistake to suppose that the characters in a dime novel are all buckskin heroes, heavy villains or adventurous, desperately painted ladies. If we ever entertained a doubt on the subject, the author of that series of novels beginning with "The Martyrdom of an Empress" has dispelled it. During the past four years she has produced as many dime novels with European royalties, dukes and duchesses starring every *rôle* that noble and ignoble human nature is capable of fulfilling. But when the heroine in "A Doffed Caronet" kicked off her glass slipper as well, married a plain citizen and became a professional horsewoman in America, we reasonably supposed that democracy had triumphed over this diadem genius, and that the scenes of her literary depredations would be changed. In this expectation, however, we have been disappointed; *A Keystone of Empire* is his Majesty, Francis Joseph of Austria. The book is interesting, of course, with anteroom gossip, where the waiting women are countesses instead of *grisettes,* and where the men are princes, not porters. Still, the effect is the same on a more spectacular scale. And the author has served so long in queen bedrooms, cringed so often in the shadow of thrones that the literary servility of her imagination much resembles in spirit the views expressed by other serving classes. It may be very good form in palaces to whisper on the back stairs of the most insignificant doings of royalty in awe-stricken tones, but to the American mind it is ludicrous. Why, for instance, should the attendants cower in terror when the Emperor is involved in a family row? Why represent him as shaking his head like an "angry lion?" From all accounts he is a very mild old man, a little given to gayeties. And upon this occasion, he evidently sputtered as any common man would have done. The point is, if Providence, or genealogy, has exalted a man to the dizzy hights of a throne, why tell tales on him that prove his kinship to the same human nature that claws and fights in the tenement house? We are all kin to it, of course, but why remind the cynical, anarchistic public that the Emperor is? It spoils the play. After that the author fails to fire our imagination with gorgeous descriptions of his presence on state occasions, or with her thrilling accounts of his courage and horsemanship. We have been disillusioned and we recognize in him a neighbor of ours, who kisses other ladies on the sly and has scenes with his wife.

The fact is, kings and queens do not belong to the atmosphere of modern fiction. In the old days, when writing was a mere matter of description, not of interpretation, they were the best of all

* A Keystone of Empire. *By the author of "The Martyrdom of an Empress."* New York and London: Harper & Bros. $2.50.

material, but now when we have reached the heart of the business, and discovered the eternal similarity of human nature in every guise or disguise, these poor figure heads of the race do not show off to an advantage. They are too much perverted by their training to feel naturally, and certainly their position does not permit them to act naturally. Meanwhile we have lost the old hallucinations about the privileges of royalty. If a prince gets drunk and banishes his mother-in-law these days, it looks about as bad as if any other man had rent his domestic horizon. He can no longer escape the judgment of common wit, which is now the ruling dynasty of this world. And only a dime novelist will attempt to cast a seventeenth century glamour about a man who is a sovereign only because he is somewhat out of fashion with his times. The only difference, therefore, between *A Keystone of Empire* and other dime novels is that it is written in an excellent literary style and costs nearly double what a good story of American life would cost. Doubtless this is accounted for by the fact that the *dramatis personæ* are the Emperor Francis Joseph and his household. Crowns and coronets still come high, even in fiction.

Mohammedan Albanians of Dibreh
From "Turkish Life in Town and Country." Putnam

Turkish Life in Town and Country. By Lucy M. J. Garnett New York: G. P. Putnam's Sons, $1.20.

At this time, when the Powers are exerting all their influence to keep the numerous and diverse nationalities of the Turkish Empire from flying at each other's throats, there will be a welcome for such a book as this, giving in com-

pact and interesting form just what the average reader wants to know about the life, religion and customs of Macedonians, Albanians, Armenians and all the cliques and clans which are so confusing to him. The annual spring outbreak has occurred prematurely by a rebellion of the Albanians, ostensibly against the reforms in administration imposed on Turkey by Austria and Russia, and we publish a cut of these irrepressible mountaineers, who certainly look calm and peaceable enough in spite of their belted arsenals. The whole series of "Our European Neighbors," of which this is one volume, is particularly adapted for public libraries.

A Flight for Life and an Inside View of Mongolia. By James Hudson Roberts. The Pilgrim Press. $1 50.

It is like seeing the sun come out of a thick fog to read a truthful account of Mongolia and its people. The traveler in Mongolian provinces often makes comparison between the American cowboy and the Mongol. Both are given a bad name they do not deserve. Peaceful, hospitable and honest, they are supposed to walk about armed and thirsting for blood. Whatever the Mongol may have been in his far past, to-day he is a roving shepherd, hunter or farmer, and always the friend of the traveler. The author is a member of the American Board of Commissioners for Foreign Missions; he is besides an explorer, good comrade and excellent shot. The Mongols, opposed to his religion, loved him for these things. He, in turn, never desecrated their gods, preached unduly or worried them with vain comparisons of civilizations. Some six Americans and seventeen Swedes, with families and friends, made up the missionary party that fled from North China to Russia to escape the Boxers, who had murdered every foreigner in their track. The author was treasurer of the caravan. The gospel itinerary from Kalgan to Kiachta may be estimated as 2,700 *li* (one Mongolian *li* being equal to the third of an English mile). The Tola, Hara Gol, Bayin Gol and Yuro rivers were crossed and numerous mountain chains explored. The journey was made by ox-cart, litter, camel, bicycle, caravan, baby carriage, or anything that could be made to go. Stops were made by the way to pick up hunted westerners, who crept out of the mountains and caves glad to see white faces. A vivid account is given of Mongol tent cities, hospitality, customs, temples, religion and history. There is a learned chapter on the Mongolian language. It is true Mongolian is easier to learn than Chinese, but there seems to be only one book for the student—the grammar and dictionary of T. J. Schmidt. The latter book, translated into English by Mr. and Mrs. Larsen, was destroyed by the Chinese. Mongolian is more diffuse than the Chinese tongues. It is an alphabetical language, and each word of it can be spelled; in Chinese hieroglyphics galore have to be memorized. Schmidt gives seven vowels to Mongolian; the author discovered ten. The syllables are units, and a word is spelled by pronouncing them. The letters look like pieces of twine tied into knots. Vertical writing is employed, and it is read down the column. In speaking the Mongols recall the American Indians, both using the full, throaty voice of out-of-doors. Their written and spoken languages differ in construction, the Kalmuks being the only division who have one form for both. The pronouns are like the Indo-European; the verbs have only one conjugation. Still the Mongol boy is to be pitied, for he has to learn Manchu, Chinese, Mongol, and often Russian, from one small book. Tho the travelers suffered from thievery, attacks by Boxers, starvation, thirst, one death, insult and poverty, little space is given to this, more being expended upon Mongol and Russian hospitality and the financial thoughtfulness of the missionary boards at their journey's end. The book is valuable geographically, ethnologically, and as the story of strong souls bent on the preservation of their lives.

Infection and Immunity, with Special Reference to the Prevention of Infectious Diseases. By George M. Sternberg, M.D., LL.D., Surgeon-General U. S. Army (Retired), etc. New York: G. P. Putnam & Sons.

General Sternberg is himself one of the great ground breaking discoverers in bacteriology and the infectious diseases. His studies on mouth bacteria and on the bacteriology of yellow fever represent distinct advances in the science of bac-

teriology that will always make a place for his name in the roll of the great medical workers of the nineteenth century. It is a special privilege, then, to have a book from him for popular use on his own subject. It has been written for non-medical readers, and technical terms have been avoided, or, wherever it was absolutely necessary to use them, have been well explained. General Sternberg writes with very practical attention to details. Such important subjects as the avoidance of typhoid fever, of tuberculosis and of dysentery, of cholera infantum and the other ordinary infectious diseases are treated from the standpoint of common sense as allied to modern hygienic knowledge. There is no glossing over of the dangers from the so-called ordinary diseases of childhood, which are sometimes considered so inevitable that children are almost deliberately exposed to them with the idea that it is better to have them over. For instance, he quotes with approval the directions published by the Health Board of the city of Glasgow, in which it is announced that measles is one of the most dangerous diseases with which a child under five years of age can be attacked. The author is one of the great authorities of the world on the subject of yellow fever, and he acknowledges that the mosquito is surely the only distributer of the disease, and that the prophylaxis of yellow fever as far as towns are concerned can be absolutely secured by following the directions given by the chief surgeon of the Department of Cuba and published by the commanding general of that Department April 27th, 1901, which are given in their entirety. In a word, Dr. Sternberg's book may be freely consulted by any one interested in the subjects of infection and immunity, with thorough confidence that it is reliable, authoritative and up-to-date.

Literary Notes

"A History of the Fanning Family," by Walter Frederic Brooks, of Worcester, illustrated with plates and maps, and limited to two hundred and ten copies, will be privately printed in the near future.

...."Pictorial Composition and the Critical Judgment of Pictures," by Henry R. Poore (Baker & Taylor, New York, $1.50), which we reviewed April 30th, comes out in a new and improved edition.

....The March number of the *National Geographic Magazine* (published by the National Geographic Society, Washington, 25 cents a number) contains as a supplement a map of Manchuria and Korea, prepared by the United States Department of War, and measuring 36 by 42 inches, which gives greater detail than any other map of the seat of war accessible to the public.

Pebbles

Fit yourself for the best society—and then keep out of it.—*The Philistine.*

...."That Miss Goggles, of Boston, is a walking encyclopedia." "But she doesn't know as much as she did. She has just had her appendix removed."—*Life.*

...."Love," remarked the beautiful girl, "is said to be the greatest thing in the world." "But I am greater than love," protested the young man, "because I can make it."—*Chicago Daily News.*

....Get back to nature, and take a short cut. It is found that a cure for appendicitis is to walk on all fours for 20 minutes four times a day. It is claimed that certain muscles around the vermiform appendix are brought into play and strengthened by this attitude. This is also a new cure for dyspepsia. It has also been found that going naked in all sorts of climates is good for lung trouble. It seems to be only a question of time when we will abandon houses and clothes, and bark good morning to each other from holes in the ground.—*Atchison Globe.*

In my trans-Baikalian home upon the Zmiehogmiptqvzworski,
With my brother Dimetriiiskiorbrneovitch I used to play;
And our cousin Petroplanztrsvm from Djargamoguvmzszoski
Oft would come to visit us and spend the day.
Ah, those happy, sunny hours of our childhood!
How I weep to think that they will come no more;
For in ruins lies the home within the wildwood,
Far away upon the Zmiehogsmiptqvzworski shore.

CHORUS.

Oh, the moon is shining brighi upon the Zmiehogmiptqvzworski,
Where the catfish browses on the new mown hay;
Through the szczyamores the candle lights are gleaming,
On the banks of the Zmiehogsmiptqvzworski far away.

—*Council Bluffs Nonpareil.*

Editorials

American Sympathy in the War

THERE never has been any warrant for the assertion made by the St. Petersburg press, a few days ago, that our Government was conspicuously hostile to Russia. It is true that the sympathies of a large majority of the American people are with Japan, but the attitude of our Government has been one of strict neutrality. Those who rule over Russia and control the utterances of the Russian press resented Mr. Hay's treaty with China for two open ports in Manchuria. The successful negotiation of this treaty was regarded and denounced as an indication of hostility. More recently, some one has circulated in Russia a series of lies apparently designed to excite the anger of the Russian people against our Government. Our battle ships, it was said, had been sent to a Korean port. The truth was that they had been ordered to Olongapo, a few miles from Manila. The commander of the "Vicksburg," it was asserted, had inhumanly refused to rescue Russian sailors from the sinking "Variag", at Chemulpo. This was false, and the Russian press now expresses regret that it believed the story. Again, we were about to permit Japan to lay a cable from her coast to Guam. For this also there was no foundation in fact. Mr. Hay's note, designed to insure the neutrality and integrity of China, was not relished, but Russia could not afford to say that this was an act of hostility. The attitude of our Government toward Russia has been faultless.

Our people and our newspapers, being free to express their opinions, are clearly—a great majority of them—on the side of Japan in this war. This preference causes surprise and "bitter disappointment" in the mind of the Russian Ambassador at Washington, who reminds us that Russia has always been the friend of the United States. It is true that Russia's friendship for this country has been shown at times when the moral support of a foreign Power was of considerable value. It is true, and we should never forget it, that this friendship was very useful during our Civil War, and especially in September, 1863. For this reason, if for no other, our Government is bound to be scrupulously just and considerate with respect to Russia in the present controversy, and our people should avoid a hasty and ill-considered judgment to Russia's disadvantage.

But the sympathies of the American people have not lightly and hastily been given to Japan in her contest with Russia. Gratitude for friendly acts in past years was a warrant for a feeling of purely formal regard for Russia on our part, but there could be no national affection in the great Democracy of the New World for Russian despotism and tyranny. It was inevitable that when Japan, whose astounding development and progress in recent years have been due in part to American influence, should at last be driven to defend herself against the selfish aggression and persistent encroachment of Russia, Americans would desire her success.

If we had not the slightest interest, commercial or political, in the result of this struggle, or in the controversy that led to it, we should still in our hearts be in sympathy with Japan, because her Government, her institutions and her ideals so resemble our own, while those of Russia differ from our own as widely as night from day. The contrast is between representative government and despotism, civil liberty and tyranny, toleration and brutal repression, a nation open to all, seeking the best fruits of civilization, brave, patriotic, and a nation where liberty is unknown, where an oligarchy rules, where imprisonment or exile to Siberian wastes is the punishment of those who aspire to be free. How great would be the world's loss if this island nation of marvelous recent growth in civilization, with its graces, its unique

courtesy, the poetry of its life, the refinement of its art, should be crushed and submerged by the Cossack!

The history of Russia's relations with Japan during the last few years appeals to our sense of justice. Russia, supported by France and Germany, withheld from Japan the Liau Tong peninsula, at the end of the war with China, because her occupation of it would be, it was said, a menace to the independence of China and Korea, and a permanent danger to the peace of the Far East. Russia then took the peninsula for herself and built a fortress there. She also took the great province behind it. Here was not only selfish encroachment that the American sense of fair play must disapprove, but also an important question of trade. Japan had promised the open door; Russia's commercial policy is one of exclusion. American disapproval of Russia in this war is due in part to her occupation and fortification of Manchuria, her repeated failure to keep her promises as to withdrawal, her attempts to prevent our negotiation of treaties with China that would enable us to retain at least a part of our growing trade with the province. Our interests on our western coast and in the Pacific require us to insist upon an equality of commercial opportunity in Eastern Asia. They will be served by the progress and freedom of Japan and by the preservation of the integrity of China's territory, rather than by a restriction of Japan and the subjection of Northern China to Russia's rule.

Even if there were no Jews in the United States, should we not recall with horror the massacre of Kishenef? Could we regard with respect and sympathy a nation in which such barbarity is permitted and goes unpunished? If thousands of Finns, driven from their native land, had not sought refuge here, should we even then be unmoved by Russia's repudiation of Finland's constitutional guarantees and her brutal oppression of the people who thus became victims of her contempt for time-honored obligations? But we have the expatriated Finns, and many thousands of oppressed Jews have come here to join the more fortunate people of their race. If Count Cassini will question the Finns and Swedes and Jews, who are so considerable a part of our population, one cause of American sympathy with Japan will be revealed to him.

Our Government will strictly observe the obligations of neutrality. Our people will offend neither of these combatants by any forbidden act. But their sympathies cannot be controlled. These are with Japan, not wholly or even largely because of commercial interests, nor mainly because the energy and intelligence of the islanders excite admiration, but chiefly because the contending nations differ so widely in character. It is a preference that is determined by considerations of civilization, humanity and justice.

Mr. Smoot's Case

THE Mormon Investigation is taking a wide course. The question before the Senate Committee is whether Mr. Smoot, a Mormon Apostle, shall be admitted to the United States Senate. It is agreed that no polygamist can be admitted to Congress, but Mr. Smoot is not a polygamist, and no one pretends that he is. So the real question in discussion is whether one not a polygamist, but an active and ruling member of the Mormon Church, can be received as a United States Senator or Representative.

On the face of it the question would seem ridiculous, for our Constitution excludes religious tests. But it does not exclude moral tests. Yet no one charges immorality of this or any other sort against Mr. Smoot.

Then, if no immorality is in a primary and personal way chargeable against Mr. Smoot, is he guilty in any such secondary way, by incitement or collusion, that he may properly be excluded? This is a main question now under investigation.

To prove this it must be shown that Mr. Smoot, as a ruling officer in his Church, encourages other people to practice an immorality, in the matter of polygamy, of which he is not himself guilty; and to this purpose the evidence is now being presented. The present head of the Mormon Church has been under long examination by the committee, and he

has admitted nearly everything which the opponents of Mr. Smoot have charged. While he denies that any new polygamous marriages have taken place, unless it may be in very rare cases against the law of the Church, he confesses that he has himself lived, and scores of other old men have lived, since the admission of Utah as a State, in continuous polygamous relations with the plural wives whom they took before that time. When asked if that is not polygamy he said No; that polygamy is the *taking* of an additional wife, which he has not done, but that it is polygamous cohabitation. When asked if he does not know that this is against the law of Utah, he says Yes, but that he felt he must take that risk for the peace of his families. He did not think it right to throw off his wives and children; and to avoid jealousies and friction he must remain in husbandly relations to his wives. He has not taught others, he says, to disobey the law, but he chose to do so for what he thought good reasons, while taking no new wives. The vast majority of his people, he said, are monogamists, and the polygamists are dying off, being now old men, and in a few years there will be none left.

This is a very frank statement. It admits pretty much all that is charged. It is a confession that would exclude Apostle Smith from the Senate, but not Apostle Smoot. It raises a question on which honest moralists may differ. The question whether polygamy or adultery or murder is or is not right, is one that must be barred from public discussion; but the question whether those who, living in polygamous communities, Mormons or Moslems or Pagans, have contracted plural marriages, must, on becoming Christians, give up all but one of their wives, is one that good missionaries have differed about. A year or two ago the family of one of our Indians was converted. The old man was told that before he was received into the Church he must give up one of his wives. It was a very hard thing to do; but the old woman took her blanket, departed to live alone, saying that the younger wife needed his protection and care more than she did. Good moralists differed as to whether the right instruction was given them. But the Utah law forbids living in plural marriage, as well as plural marriage itself, and no pluralist has any place in Washington. The testimony of the head of the Mormon Church shows that while the Church holds that plural marriage is in itself right, and that it was ordained by revelation to Joseph Smith, yet the further taking of plural wives is now forbidden, while the continuance of plural relations with those previously taken is winked at, but not taught. So far no evidence has appeared on this line to exclude Mr. Smoot.

But another line of testimony is being prepared, that which will show, if possible, that Mormons are under such bonds to obey their Church that they are not free to be good citizens of their country—that is, that the authorities of the Church rule and control the political action of their members, so that a man has no right to accept a political office except by permission of the Apostles of the Church. It is recalled that Mr. Thatcher was excluded from the Mormon Church for acting politically against the Church's orders. It has been asserted that there are oaths taken which are treasonable. For this we await the further evidence. Thus far nothing has been proved that is likely to show that a loyal Mormon may not also be a loyal citizen, unless he be living a polygamous life. Practically the question before the Senate is whether any Mormon can be a member of that body. Must that Mormon State be represented only by a Gentile? Much as we despise and detest Mormonism, we must wait further evidence that a Mormon cannot be admitted to Congress.

The Ultimate Bar to Vice

HARDENED as the city dweller is to a knowledge of the prevalence of vice in all dense centers of population, we doubt if any decent American has read without a touch of horror Mr. Jerome's assertion that at least 2,000 of the 2,509 hotels in New York City are "open houses of prostitution." They have been made so, he says, by the Raines Law, which compels the saloon men who wish to keep open nights and on Sundays to maintain in each establishment as many as ten fake rooms, from which some income must be obtained.

It is not our purpose at the present time to discuss the wisdom or the unwisdom of the Raines Law. It was the conclusion of the Committee of Fifteen, composed of men of the highest character and intelligence that this community boasts, that the Raines Law has made vicious conditions in this city on the whole much worse than they were before its enactment. Be that as it may, the far more terrible fact is that of the prevalence of a particular form of vice which invariably finds some opportunity for indulgence, if not in a way that law and the police have for the moment barred, then in some other way, which depraved ingenuity discovers to be still open.

We call ourselves a Christian and a civilized people. We boast that in America the family life is at least as pure as it is elsewhere in the world. We take pride in what we are pleased to call an American reverence for womanhood, as if it were a virtue more characteristic of this nation than of others. We make relentless war upon polygamy, and keep up a persistent agitation for the enactment of uniform laws of marriage and divorce; and yet, in our chief city, a fearless official, who has devoted many of the best years of his life to an attempt to discover the actual facts about our moral condition and to enforce the law of repression to the letter, is obliged to inform us that 2,000 hotels in this town are open houses of prostitution; and a recent investigator, whose statements are published by authority of the Charity Organization Society, tells us that at least 10,000 immigrant girls landing at Ellis Island are annually forced or lured into habits of harlotry.

If we could explain this state of affairs by saying that this appalling prevalence of vice is merely an incident of the heterogeneity of our population, and lay most of it at the doors of the foreign born, we might possibly feel less concern about it. But that explanation will not hold. Every person familiar with the facts knows that while the unmarried men whose homes are here in the city, and especially those who live in the tenement house quarters, furnish their full quota to the army of ill-doers, another large division of that army consists of out-of-town men that have occasion often to visit the city for purposes of business, and that among them are multitudes of married men who, in their home communities, maintain unblemished reputations for honorable conduct. We are aware that this statement may be challenged by sensitive persons unacquainted with the facts, but it can be substantiated. And with it stands another fact that in some respects is even more humiliating. We have made inquiry among business men who have every means of knowing the truth as to whether a man's commercial credit is impaired by a general knowledge on the part of his associates that he keeps a mistress, and we are assured that it is not.

We are not stating these facts for any sensational purpose or to create discouragement. We are calling them to attention for the purpose of reminding the public how far the policy of attempting to diminish vice by repressive measures has failed, and how necessary it is to begin to place greater emphasis upon moral education and upon all influences that tend to awaken in the individual consciousness an idealistic view of life that shall be able to hold in proper subordination both the sensual instincts and those materialistic ambitions that are rapidly becoming the greatest menace of modern civilization.

Much, we believe, could be accomplished if the knowledge that the medical profession possesses of the frightful ravages of contracted disease could be disseminated among the people. The average man lives under the illusion that these consequences of vice are easily cured. The practitioner knows that they leave after effects of the most fatal character; that they are often responsible for the sudden break-down of active men in the years of their prime, which is so characteristic of American life—the sudden termination of honored careers through Bright's disease, locomotor-ataxia, heart failure and cerebral hæmorrhage.

But this medical knowledge, with its appeal to prudential considerations, is not enough. It must be supplemented by the awakening of that kind of idealism which starts into life all the springs of self-respect, of chivalrous and generous feeling toward womankind, of consideration for offspring, and, above all, that perfect love which alone can give sacredness to the relation of man and woman.

It has been alleged that love between man and woman in its highest manifestations is a relatively modern product of the esthetic and moral evolution of the human race. We believe that this conclusion is substantially true. We believe that among the American people particularly, a pure and beautiful love is more and more becoming the basis of the marriage relation, and that where it exists all impure indulgences are made impossible, not by the pressure of external restraint—even that of public reprobation—but by the spirit within. This evolution, however, is not yet so pronounced that it may not be checked, or that it stands in no need of a conscious reinforcement by educational influences. We cannot carry it forward to its fruition if we permit ourselves to make apology for those marriages that are based upon mere social propriety or material considerations.

Our Own Kind and Our Other Kind

We all have two kinds, those who are related to us personally, socially or intellectually, and those who are not. The latter, however, have recently risen up from the alleys, dark places and ends of the earth to insist upon their kinship also. They are our poor relations, who have multiplied and waxed exceedingly strong, until now they not only outnumber our own kind, but they know it. That is the rub. In the regions from whence they come there are few fine discriminations based upon difference and delicacy of temperament, but their ruling passion, their self-protecting instinct, is the natural one of kinship.

Now it is interesting to observe the indifference of one class, the fastidious reserve of another, and the avowed hostility of still others to this somewhat vulgar formula of universal brotherhoood that has been thrust upon them by the enlightened consciousness of that underworld, rather than the enlightened conscience of the higher orders among us. The explanation of the embarrassments and indignities attendant upon these readjustments of human nature's different kinds are not always reasonable, but they are generally apparent.

In the first place, the most highly developed men intellectually among us, the really great students, scientists and philosophers, have less in common with this "other kind" than most people. For the further a man advances in the scale of things the fewer are his prejudices, indeed; but his natural sympathies are also decreased. Morally he recognizes his obligation to the race, gives his goods to feed the poor, his time and talents for their enlightenment, but personally the bonds that bind him to his kind are attenuated. In his purely academic regions there is less need, and so less sense, of natural relationships. The late German historian Mommsen sympathized intellectually with the socialistic movements among his countrymen, yet, with a world full of admirers, he acknowledged, they say, but one intimate friend, a man whose company he could endure but a limited time and whose conversation he could never endure at all. He did not recognize his own children when he met them on the street, and his relations to his good *frau* appear to have been purely functional. Such men have for the most part only a moral and intellectual perception of what is passing in the world about them, and they cease to be dependent upon the ordinary intimacies of life. They do not recognize social distinctions, for the simple reason that they do not recognize society in any personal sense.

These, however, represent but a small class, and, having surpassed the common kind, the excuse for their withdrawal is almost legitimate. But what shall we say of those who make a purely esthetic and nervous distinction between themselves and their "other" kind? Is this greatest of all social quarantines justified by the facts in the case? Evidently they have a refinement of sensibilities, an elegance of mind and taste, that the grimy, sweating herd of men and women outside do not possess. But when we consider, the moral and even the intellectual difference between the two is somewhat in favor of the herd. Newport society fosters the same vices that are practiced with attic simplicity on the East Side; and wit in the two localities differs less in shrewdness than one may imagine. And there can be no doubt that the working classes hold more liberal opinions on affairs in general than do these temperamental aristocrats.

Recently a workingman entered a street car already crowded with fashionable people. He carried a dinner pail shamelessly and sat near the door, where he faced the crowd. Presently the electric current failed and the car stopped. At this the theater party looked its discontent, but a sense of social dignity prevented further demonstration. Not one of them during the long delay risked addressing his neighbor. The implied distrust of their own kind was ludicrous, if it was not justified. No mind filled with lofty thoughts separated them; their natural instincts were almost sensually developed, but a lack of personal liberty, a rigid social discipline, rendered intercourse not guaranteed by a formal certificate of introduction impossible for them. The workingman's sympathies had not been so limited. He took his relationship to them cordially for granted. Having learned the cause of the delay, he made this accommodating announcement:

"She's busted a battery, an' we'll set here twenty minutes yet!"

Nor was he discomforted by the icy silence with which his remark was greeted. The human glowed in him so warmly it is doubtful if he felt the social chill, for, looking at the elegantly dressed lady opposite, he persevered kindly: "Air yer feet cold, m'a'm? Jest poke 'em up agin this pipe an' you'll be more comfortable." She flushed indignantly, wavered prettily, and thrust out the toes of two thin boots "agin the pipe."

"I'm in the ice business—awful joke this weather!" he next confided, with a bright, brown flash of his eyes at a gentleman across the aisle. A universal, condescending smile answered this naïve confidence. But really he had the advantage of them in the breadth of his fraternal emotions. He was capable of acting as personal friend to any man in the car had the occasion demanded it. There was something admirably improvident, generous, in his bestowal of human kinship upon people whose delicacy was not of the sort to appreciate the simplicity of his natural courtesy.

However, when the fortunate "better" kind are made more catholic in their recognition of men, and when human nature in the other kinds has been furbished up, endowed with an artistic sense, we shall discover that we all belong more nearly to one kind than we supposed. Even the great scholars and scientists may join us in their hours of relaxation.

The Inner Witness

HERE is a letter which seems to be sincere, and which asks a serious question as to Christian faith. The writer says:

I am a sincere Christian and want to remain one. But my doubts are becoming numerous and to me terrible. Reading apologies for the Christian religion seems to intensify and not to quiet these misgivings. Professor Briggs, for instance, in this week's INDEPENDENT, says Christianity consists in knowing that Christ is the God Savior—and knowing it by "practical experience and personal knowledge." Does this experience and knowledge exclude the possibility of reasonable doubt? If it does not, how can we as rational beings accept it? Surely the evidence should be as convincing as that on which we send criminals to the electric chair. "Practical experience," I will be told, is that inner satisfaction and peace of spirit which the acceptance of Christ's doctrines gives. Is this a criterion of the truth of the Christian teaching? Have not the Christian Scientist, the Mohammedan and members of other religions practical experience which we say is no sign of the divinity of the teachings which produce it? Does not the modern psychologist explain this practical experience to be a merely human production? As for "personal knowledge," is not this claim open to the same objections? Has one person any means of knowing Christ that another has not? The means are the Bible history and the inner spirit. Certainly the Bible history and tradition do not clearly teach who Christ was. When a proposition is evident it ceases to be disputed, at least by intelligent people. The truth of the Copernican theory is now evident. So is the iniquity of the massacre of St. Bartholomew. Now if the divinity of Christ was evident—I mean, of course, reasonably evident; such evidence as a jury requires to convict a man of crime—would not all good and intelligent men agree upon it as they do upon the Copernican theory? As for the testimony of our interior spirit telling us that Christ is our Savior, is this trustworthy? Is not this interior spirit a purely natural product, the result of training, environment, suggestion, etc., making of one person a Catholic, another a Protestant, another a Buddhist, another a Jew, and so on? Now please do not ignore my appeal. I have been a most earnest Christian, and want to remain one, but I have a rebellion of my reason to put down. A reasonable amount of force in the form of evi-

dence will quiet the rebel. If "practical experience" and "personal knowledge" are unreliable and insufficient in me, how can they be otherwise in you?

We are sorry for one who has been brought up with such a notion of Christianity that his peace depends on his believing something instead of being something. The propositions he believes will not save him in this world or the next, notwithstanding the statements of any obsolete creed of Antichrist which tells us that except we believe so and so we shall without doubt perish everlastingly. Theology is an admirable and most interesting study which may profitably employ the time of angels, and of devils, too, as Milton tells us, and James, also; but the securing of sound evidence as to the person and history of Jesus Christ will bring nobody into the Christian state.

What our friend is after is evidence of historic truth that can be formulated. If he gets it it will not save him. He is going to work the wrong way. He has been told that he must get some inner spiritual peace or rest that will be a testimony of the Spirit, which will give him "practical experience and personal knowledge" that "Christ is the God Savior." If others can get in that way, or think they can, the evidence of the truth of an intellectual proposition about Christ, let them; but what a man believes in his heart, not intellectually in his head, that is he. There is a multitude of people so built intellectually that they cannot get any such inner testimony to an outer fact; probably most of us are so built. To require them to discover within them what they cannot discover, is to remand them to that distress of mind which our correspondent confesses to, and very likely to final unbelief. Here is the evil of the false notion that true religion consists in part in the acceptance of propositions of fact. Tell them that they must believe something about the Bible, or Christ, which their intellect can find no evidence for or they must perish everlastingly, and they are driven to reject Christianity. Or tell them that they must find an inner testimony or they will perish, and they will be driven into unbelief, equally by the new introvision as by the old logic.

What, then, is the better way? As to belief on Christian matters, and all other matters, it is the undisturbed, impartial search after truth by means of the evidence within reach, without worry as to the conclusion. It is important to reach the right conclusion, the real truth, for it may have an influence on life and character. But it is not itself life and character. Life and character may come with a wrong reading of the evidence and a mistaken conclusion.

But being a real Christian in life and character is quite a different thing. That has to do with what a man is, and not what he may believe on things that he questions about. Jesus gave some very compact and philosophical answers to questions on that subject, to which we would refer our inquirer. If he is after internal witness he had better search his soul to find out, not whether he has visions of Christ or assurances of the truth of any dogma about Christ, but whether he meets the requirements as to his disposition toward God and man which our Lord lays down.

Military "Honor"

A Russian officer named Kublitsky was recently passing along the streets of St. Petersburg at the head of his company when he was accosted by a ragged beggar, who insulted and struck him. The officer turned and looked at him, but instead of running him through with his sword as the code of military honor required, he shrugged his shoulders and passed on. That evening he committed suicide, leaving this note:

"I know that my conduct will be blamed by my companions in arms. I should have killed the man who struck me. I did actually put my hand on my sword, but when I saw before me a poor wretch, almost famished, who instead of running, looked at me like a madman, and cried: 'Kill me! Kill me!' I could not strike him. I pitied him. I felt that before being an officer I was a man. And since I do not want to be accused of insubordination and cowardice, I kill myself."

In commenting on this his superior officer, General Dragomirof, condemned his conduct and said that he should have cut down his assailant on the spot. He says:

"Gunpowder remains in the magazine per-

fectly inoffensive, but let a single spark touch it and it explodes, destroying the rash man who drew it from its sleep. It is the same with an officer, pacific when he is let alone, but at the first provocation annihilates the impudent man who dared attack him."

A similar incident occurred in Germany not long since, when an officer was approached in a familiar manner and clapped on the back by an old friend and schoolmate, who was, however, a private. Without an instant's hesitation the officer drew his sword and ran him through the heart. He wrote a pathetic letter to the mother of his friend, expressing his sympathy and regret that the honor of the army necessitated his action. In deference to public clamor he was sentenced to a short term of imprisonment.

As another illustration of this stringency of the code of honor we recall the German officer who was conducting a drunken comrade to his home when the latter struck him. He was quite willing to overlook or to pardon this and his brother officer to apologize for it, but this was not allowed. The blow must be wiped out in blood. A duel was fought and the officer killed the friend to whom he had unintentionally and unconsciously offered offense.

General Dragomirof's simile is a good one, but he does not go far enough. Kegs of gunpowder are not allowed to roll about the streets, and officers of like explosive temperament should be confined in fireproof vaults. They certainly should not be permitted to mingle with ordinary people, who have other ideals of honor and propriety. It would be well also to consider whether an army where such ethics and etiquet are cultivated is more dangerous to the people whom it protects or to their enemies.

There are too many archaic forms and traditions in our own army, but, so far, nothing like this. In some parts of our country, however, it is still held that a blow requires a murder, and we occasionally hear a man boast that the world is not big enough to hold himself and one who has called him a liar.

The Senate and Arbitration

It would be pleasant to be informed that the United States is taking part in negotiating treaties of arbitration with other countries. We have a certain conceit of our superiority, and we never forget the example we set to the world in formulating a free government in our national Constitution, and we are not at all slow to claim credit for the creation of the Tribunal of The Hague; but somehow we are letting both South America and Europe set us examples in arbitration. Chile and Argentina have taught the whole world the lesson of peaceful methods, and have then sold their warships to emphasize their good faith. Great Britain, France, Spain and Italy have made or are making treaties of arbitration with each other, of more or less value—certainly of some value as a beginning. But what of our own country? Cannot we as safely make a treaty with Great Britain as can France? Or is it the fact that our treaty making method is a very cumbrous affair, as compared with that of the other countries? There the existing Government can make a treaty; here the Government—that is, the President and Cabinet—must get the consent of sixty Senators before a treaty can be concluded; and before negotiating a treaty the President and Secretary of State must be reasonably confident of their sixty men, or the treaty, formulated with much labor, will be rejected disdainfully, as in the case of the arbitration treaty with Great Britain a few years ago. We need a Senate that believes in arbitration, and that is not afraid to trust international differences to an impartial tribunal.

The Rank of the Ministry

Perhaps nothing need be added to the words of Dean Robbins prefixed to the article, "Why I Gave Up the Ministry," in the present issue, and yet we do not like to leave some of its impressions uncorrected. And first, as to the quality of the men who enter the ministry, we believe the writer is quite wrong and that the ministry has its fair share of scholarly and brilliant men. There are weak men in the theological schools, and so there are equally in the medical and law schools. It is true that the proportion of the best scholars that go from college into the ministry is growing smaller, but that is not because a smaller proportion of the ministry is composed of bright men, but because we are coming to demand college education

of lawyers and doctors, which we did not a few years ago. Even now, while all our reputable theological seminaries require their students to be college graduates, this is not generally true in the other professions. Further, the number of ministers is much less than of doctors and lawyers. There are now few of our cities or towns in which the ministers do not stand well up in the front ranks with the lawyers and physicians as men of recognized ability, but these other professions have been rapidly coming up. If from 14 to 16 per cent. of the high grade scholars in the colleges enter the ministry, that seems to us to be a fair proportion. As to the rest of the article we need say little. It is true that the work of the Church has branched out into all sorts of benevolent work, and that the direction of this work falls largely and naturally upon the ministry; but that is a reason for staying in the Church, and for the Church staying in the world, and not the reverse. Dr. Conwell, pastor of a Baptist Church in Philadelphia, whose membership is counted in "four figures," has a way of saying that the Church is in these days being swamped and buried by the institutions it has created—the Young Men's and Young Women's Associations, the hospitals and asylums. Well, the more such allied good work the better. Would that all the world's people were prophets. It may be that in Heaven there is no Church organization required, but we see no sign that its work is so nearly done in this world that the work it has to do will not for a long time to come constitute a "call" to men of earnest purpose.

Russian Unrest

The war with Japan is by no means popular all over Russia. At first the Government allowed public demonstrations in its favor, but soon it stopped them, because they gave excuse for counter-demonstrations. Now we hear of universities closed because of students' disturbances, and of incendiary circulars distributed in schools and factories. It was to be expected that Jews and Finns and Armenians and Dissenters would be in opposition, for have they any reason to approve anything the Government does? It is clear that there will be a fire in the rear to be dealt with. In our Civil War we had one such notable hostile demonstration in New York, a regular riot, but it did not reach the intelligent classes; the feeling in the universities was unanimous; the opposition was transient and amounted to nothing. But in Russia the only hope for liberty and a representative government is in the continuance of anti-dynastic agitation. Disaster in the present war would increase such agitation and give it courage. It is possible that out of war with a so-called pagan nation there may come the promise of Christian liberty for the so-called Christian nation.

The petition to Congress of the Northern California Indian Association deserves friendly consideration. It asks that small, scattered tracts of land be purchased by the Government, upon which several thousand vagrant Indians in that part of the State may find homes. Some of these Indians, not knowing how to secure a legal recording of their title, have been evicted from lands which they had themselves purchased by days' labor. Some lost their tribal lands years ago through non-ratification of treaties, and in one way and another they have been crowded by the enterprising white man into vagrancy and almost helpless pauperism. The purchase of a few acres here and there where the Indians are now found would not deprive them of the discipline of labor, but give them a place where the fruits of their labor can be secured to them. Ethically this small expenditure would be no more than fair, since no pay has ever been given them for lands which they once occupied and the white man now possesses, and practically there need be no such fear of a demoralizing lapse into "the reservation system" as was voiced in a rather hysterical counter petition which went to Congress from an Indian school in the East.

The tangle in Count Leo Tolstoy's mind is illustrated by the letter from his pen which we print in this issue. We trust that none of our readers will try to educate a child after Tolstoy's rules. He would "not force anything on children;" he would not "force a child to study subjects that do not interest it;" he would

not "teach children religious conceptions about which they do not ask;" and, most surprising of all, in the religious education of children he would give them equally the doctrinal literature of Christians, Hebrews, Buddhists, Brahminists and Confucianists. On the contrary, children should be required to learn much they do not want to learn, just as they must be required to do work they do not like. And the parents ought to teach them in religion first what they believe to be true, and let the error wait till they have passed the receptive age and have reached the age for independent thought.

It is a little amusing that a French journal has been polling the members of the French Academy to find out the meaning of Secretary Hay's new diplomatic term, "administrative entity." They do not exactly understand it. Perhaps the word *entité* has a slightly different meaning in French from that of the English word, but with us it is not simply an abstract term, meaning *existence,* but also a concrete term embracing the thing that exists. Of course, Mr. Hay meant to employ a loose and vague term, and he succeeded. He did not want to say *China,* because that was itself in dispute; so he spoke of China's "administrative entity," which might mean to include the Government as actually exercised, and might well exclude Manchuria, whose administration is exercised by Russia. It appears to us a happy phrase, tho a new one.

We have a letter from the Rev. John S. Wynne, S.J., editor of *The Messenger,* a Catholic journal of this city, in which he gives at length the history of the issue of the Rosary Leaflets by the Jesuits and the Dominicans, to show that we were mistaken, when in our editorial, "Will Loisy Repudiate His Book?" we stated that some dozen years ago the Jesuits began publishing these leaflets and that some four or five years ago, at the instance of the Dominicans, they were forced to stop the practice. He gives facts and dates to the contrary, and says that the Jesuits of their own accord ceased to print them, and insisted on leaving the exclusive charge of this devotion to the Dominican Rosary Societies.

We are still waiting to hear what the Abbé Loisy intends to do about the condemnation of his books. He has, we learn, been twice summoned to make a retraction pure and simple, "*ad ulteriora,*" which is a threat of final proceedings. But we venture to guess that he will delay any such submission, and that the authorities on the Tiber will delay going to extremities. The French Concordat is just now *in articulo mortis* and needs looking after, and Loisy may be shelved *pro tempore;* and so we do not expect speedily to see the note attached to his name in the records of the Index: "*Laudabiliter subjecit se.*" The reader will please excuse so much Latin, but it is the language of the subject.

At last we are getting at the cause of the native uprising in German West Africa, and we find that it is much the same as has occasioned Indian outbreaks in this country—the ill-treatment of the natives by white men. The cruelties of Prince von Arenburg there were atrocious and explain everything. And now, convicted on a first trial for murdering a native, he has been acquitted on a second trial on the ground of insanity. But the insanity seems to have been moral.

Whatever defense or apology may be made for the decision of the arbitrators of the court of The Hague in the Venezuela case, there can be no doubt that Japan is justified in her protest against the language used by Mr. Muravieff, Russian Minister of Justice and President of the Tribunal, in making the decision. It was no time or place for an attack on the Japanese, and the language discredits the Tribunal.

Mr. Wilbur Wright, we regret to say, is not satisfied with our explanation of February 25th in reference to the article published under his name in our issue of February 5th, as received by us from one of our literary agents. He says:

"Your note is equivalent to an assertion that I furnished the matter for the article but objected only because my name was used. This is not true at all. Mr. [our agent] did not obtain copies of these addresses from me or my brother. Nor did we consent to the reproduction of extended verbatim extracts from them except on consent of the Western Society of Engineers, a condition which was not fulfilled."

Mr. Wright then asks us to explain to our readers that the article was in large part made up of matter taken "from the *Journal of the Western Society of Engineers* and in part of matter whose correctness I absolutely deny."

We give the above in Mr. Wright's words, and again express our regret that our agent should have misled us as to the permission to attach Mr. Wright's name to the article for which he had obtained material and information.

Insurance

The Combustion of Water

"The conflagration hazard continues to assume gigantic proportions. The editor of *Insurance World* over twenty-five years ago took the position that whereas in an incipient combustion water properly applied would quickly extinguish the flames, however, if the fire assumed great proportions that water then became a feeder of the flames and not a deterring agent. In a certain sense water is the cinder of hydrogen. It is from the laboratory point of view labeled H_2O; or, in other words, two parts of hydrogen to one of oxygen. Both these elements are combustible when disassociated. Hence, in a great conflagration water becomes a fuel. In this line of thought a German scientist whose name we do not now recall has expressed himself that the fuel of the future may be found in water by disassociating its component parts. Who knows? The horizon of scientific research is continuously expanding. Water is one of nature's elements that has a twofold expansive power. Under extreme heat it becomes steam; with extreme cold it expands into ice."—*Insurance World of March* 1st, 1904.

The advice of the editor of the *Insurance World* would be much more valuable if he would study a little elementary chemistry, and not attempt to determine scientific problems from flashes of intuition received "over twenty-five years ago." In reply to his question, "Who knows?" we would say that any text book shows that water can never be made a fuel, even by a "German scientist." "The horizon of scientific research is continually expanding," and for that reason the things we know to be impossible are constantly increasing. It is not true that "water is one of nature's elements." It is not true that both the elements into which it can be decomposed are combustible, and there is no sense in which it is true that "water is the cinder of hydrogen." A cinder is something which has never been burned, because it is incombustible. Hydrogen is combustible and on being burned forms water.

It is quite true that water used in small quantities on an intense conflagration may increase the flame and assist in spreading it. The cause of this is that water is decomposed by the intense heat, and its elements, hydrogen and oxygen, again uniting produce the same amount of heat which they absorbed when they were dissociated. There is therefore no increase of the whole amount of heat, but there may be a transference of heat from the place where the water is applied to the place where the gases again unite. Of the same nature is the effect produced when a locomotive engineer who finds himself running short of steam just before he reaches the top of an ascent may throw a little water on the bed of glowing coals. He is not adding fuel and, in fact, loses something in the whole amount of heat, but the heat suddenly produced above the bed of coals may bring the steam up to the required pressure.

THE new business of The Mutual Reserve Life Insurance Company, of which Frederick A. Burnham is president, is steadily growing, we are glad to say. The new business thus far this year, we have been told, is more than double the business during the corresponding period of 1903. During the past year more than $3,200,000 was paid to policy holders, so that the total payments to policy holders now amounts to more than fifty-seven and a half million dollars. The surplus of policy holders is over one half million dollars.

....Embezzlements and defalcations for the month of December, as tabulated in the current issue of the monthly *Bulletin* of the Fidelity & Casualty Company, under the possible influence of the holiday season and its allurements, show an enormous increase over the month preceding. The melancholy record of breaches of trust that seems to be a constantly growing condition of modern life includes the following items:

Banks	$304,520
Benevolent societies and institutions	1,550
Building and loan associations	285
Court trusts	62,600
Federal and State	7,368
Firms and corporations	991,828
Insurance companies	20,299
Municipal	8,587
Transportation companies	18,500
Miscellaneous	656,971
Total	$2,072,508

Financial

The Canal Payments

No disturbance in the local or exchange markets, it is generally believed, will be caused by the approaching payment of $10,000,000 to Panama and $40,000,000 to the French Canal Company. Secretary Shaw's call upon the depository banks for 20 per cent. of their holdings, about $30,000,000, will not mature until the 25th, and it appears now that the payment must be deferred until April. About $20,000,000 is to be drawn out from the Treasury's funds. An easy loan market and unusual inactivity on the Stock Exchange afford favorable conditions. Of the Panama money, $8,000,000 will probably remain here for investment in bonds, and it is understood that a considerable part of the French company's stock is now owned in this country.

Interesting Purchase of the New Haven Trolley Lines

Under the management of President Mellen, the New York, New Haven and Hartford Railroad Company is taking measures both for the improvement of its traffic facilities and for the prevention of actual or projected competition. Its recent acquisition of the Central New England road and Poughkeepsie Bridge system has now been followed by its purchase of the trolley system centering in New Haven and owned by the Fairhaven and Westville Company. Thus it gains possession of all the city's trolleys, with branches extending to Derby, Branford, Woodmont and other suburban towns—in all 110 miles of road and one-fifth of the trolley mileage in Connecticut. An issue of about $9,600,000 in 3½ per cent. fifty-year debentures is required for the transaction. In the exchange the trolley shares (par $25) are valued at $50.

While these trolleys can be made serviceable as feeders and distributors in connection with the steam road, the chief purpose of the New York and New Haven Company is undoubtedly to interpose a barrier to the possible operation of a parallel trolley line between Boston and New York, and incidentally to control the competition of existing trolley branches with its suburban service in the neighborhood of New Haven. This purchase must interfere with the plans of the projectors of a through trolley from Boston by way of Worcester, Rockville, Hartford, Middletown and New Haven. A considerable part of this line is in operation, and arrangements had been made for filling gaps between Worcester and Rockville and between Hartford and New Haven. A traffic agreement with the New Haven trolleys was under consideration. Negotiations for such an agreement may be continued, but obviously under conditions differing greatly from those which existed before this purchase. The incident is very interesting to those who are studying the competitive relations of trolley roads and steam trunk or suburban lines.

The new President of the Guardian Trust Company is Frank W. Woolworth. The capital and surplus of this company is one million dollars.

....The National Citizens' Bank is to absorb the Central National Bank and will be named the Citizens' Central National Bank of New York. To acquire the assets of the Central the Citizens' capital will be increased from $1,550,000 to $2,550,000.

....An American company, whose chief officer and expert is Julian Kennedy, once a famous Yale oarsman, has recently taken contracts for remodeling upon American lines the blast furnace departments of sixteen British iron and steel plants, including several of the leading concerns of the kind in Great Britain.

....The directors of the two institutions have agreed upon the terms of a merger of the Leather Manufacturers' National Bank with the Mechanics' National Bank, whose capital will be increased from $2,000,000 to $3,000,000. It is expected that Gates W. McGarrah will be President of the combined banks.

....Receivers having been appointed for the property of the Houston Oil Company of Texas, Jules S. Bache (of J. S. Bache & Co., New York), and several bankers of other cities have consented to act as a committee for the protection of stockholders. Shares must be deposited before the 17th.

The Independent

Vol. LVI NEW YORK, THURSDAY, MARCH 17, 1904 No. 2885

Survey of the World

The Field of Politics

Rhode Island is the first State to elect delegates to the Democratic National Convention, and six of her eight delegates are for Mr. Hearst. There was a contest between two factions, one (in favor of Hearst) commanded by John J. Fitzgerald, of Pawtucket, Democratic leader in the Legislature, and ex-Mayor Greene, of Woonsocket, member of the National Committee; the other by Col. Samuel R. Honey, of Newport, and Patrick H. Quinn, chairman of the State Committee. Mr. Hearst's friends (mostly from the cities and manufacturing towns) controlled the convention by a small majority. Having chosen six of the eight delegates, they permitted the two remaining places to be taken by Honey and Quinn. No instructions were given, but after the convention the six Hearst men adopted resolutions in favor of Hearst and the unit rule. Col. Honey says he will never vote for Hearst. In the convention Richard B. Comstock said that it would be "infamous" to nominate Hearst, "a man who would buy the Presidency by check and cheek." Mr. Hearst's followers commended him as one who had "fought the battle of the people against the monopolies." It is reported that Mr. Bryan will present Mr. Hearst's name in the national convention. —In New York, ex-Senator Hill and ex-Senator Edward Murphy, Jr., of Troy, have joined hands for Judge Parker, after warring against each other for years. This means defeat for Charles F. Murphy, the Tammany leader. Judge Parker's supporters will control the convention, and it is expected that the delegates will be instructed to vote for him. The Tammany leader has said that Mr. Cleveland would be the strongest of all possible candidates, but Mr. Cleveland remarks that this expression of opinion and preference does not in any way affect the decision announced by himself some time ago "as strongly as the English language could make it." He deplores the use of his name in New York to the disadvantage of another candidate.—Before Mr. Hanna's death the two Senators from Ohio disagreed as to certain post offices. Mr. Foraker desired that the postmasters at Lima and Napoleon should be displaced by men of his selection; Mr. Hanna asked that these officers should not be disturbed. Last week, Mr. Foraker's candidates were nominated and confirmed.—Senator Scott appears to have inherited from Mr. Hanna the task of leading the opposition to the promotion of General Leonard Wood. In addition to his own remarks he has submitted a long argument prepared by Mr. Hanna, in which all the charges against General Wood are elaborately set forth. It is expected, however, that the nomination for promotion will soon be confirmed.

Excitement Over a Postal Report

Much excitement and anger were caused in the House, at Washington, last week, by the reply of the Post Office Department to the request of the Post Office Committee for the official record in support of the assertions of the original Bristow report concerning the recommendations and requests of Congressmen relating to additional clerk hire allowances and the leasing of rooms or buildings for post offices. This reply was laid before the House by unanimous vote of the committee. In the instances cited the names of more than 140 Representatives or Senators are involved. The

statement covers 218 pages, and is considered in our editorial pages. There was complaint that essential parts of the record had been omitted. In the course of the debate the Department and its officers were sharply attacked and denounced by prominent Republicans, who asserted that an attempt had been made to connect them with the corruption and crimes of those who have been indicted. Mr. Grosvenor declared that it was an infamous outrage. Mr. Hill said that the report was the product of a liar and a scoundrel. Mr. Bristow was called all sorts of names, but it was afterward shown that he had been ill for several weeks and had not seen the report. Democrats insisted that Postmaster-General Payne had taken this method of restraining the House from subjecting "his rotten Department" to thorough investigation. They called him a "distinguished imbecile." Mr. Jenkins, of Wisconsin, said that Mr. Bristow ought to be removed at once. At times there was an evident inclination to hold the President responsible for the alleged injustice and incompleteness of the statement, and Mr. William Alden Smith's nomination of Speaker Cannon for the Presidency was favorably received. The House was in a very ugly mood. At last it was decided that there should be no comprehensive investigation of the Department, but that the obnoxious report should be referred to a select committee, with the understanding that the members affected by it should be heard, and that all official papers relating to their dealings with the Department should be produced. The committee is composed of Messrs. McCall, of Massachusetts; Hitt, of Illinois; Burton, of Ohio; Metcalf, of California; McDermott, of New Jersey; Bartlett, of Georgia, and Richardson, of Alabama. The report contains the name of no one of these.

Offenses of the Dawes Commission

Congress has received from the President the report of an investigation made by Charles J. Bonaparte and Clinton R. Woodruff concerning charges against the Commission to the Five Civilized Tribes in Indian Territory (the Dawes Commission), made by Mr. Brosius, of the Indian Rights Association. The investigators say that while some suggestions of the Brosius report were not justified by the facts, its specific allegations against Federal officials are substantially true. The situation, they assert, involves "immediate danger of ruin to the genuine Indian population, and profound discredit to the United States, exciting reasonable discontent on the part of all classes of the population, and demanding prompt and drastic remedies on the part of Congress." The charges related mainly to the interest of Commissioners and other officers in corporations devoted to speculation in Indian lands. Chairman Tams Bixby's connection with the Canadian Valley Trust Company, the report says, has impaired his usefulness as a public officer and should terminate immediately. His investments in "possessing rights" to town site lands are even more objectionable. Commissioner Needles should divest himself of his interest in a corporation at Vinita. Commissioner Breckenridge's investments are said to be of much graver importance, and to have seriously impaired his usefulness. Inspector Wright and Indian Agent Schoenfelt are exonerated. Many of the so-called Trust companies operating in the Territory are, the report says, "little more than associations of individual 'grafters.'" The Commission itself, it adds, can be abolished with advantage. Secretary Hitchcock, while approving the findings and recommendations, prefers that the Commission shall complete its work. Members of the Commission have been informed by the President that if they continue in the Government service they must sever all connections with business operations which can be affected by their official action or position.—The Senate has passed a bill making the receipts from liquor, occupation and trade licenses in Alaska a fund to be used in establishing and maintaining schools, caring for the insane, and constructing roads.

Isthmian Canal Questions

The American counsel and the president of the French canal company agree in saying that there is no obstacle to prevent a transfer of the company's property to the United States, and that the transfer will be completed before April 25th. Colom-

bia's suits against the company, they assert, have no sound basis, and will be promptly thrown out of court, both the Government and the legal authorities desiring to facilitate the sale. Mr. Cromwell, the counsel, discloses the fact that, while the Hay-Herran treaty was pending at Bogota, Colombia in writing demanded $12,000,000 from the company. "I refused to pay this," he says, "and shall continue to refuse to pay her a penny as the price of peace in her pending groundless suits at Paris."—The Commission will sail for the Isthmus on the 29th. Each member's salary is to be $12,000, with $15 per day in addition for all time spent on the Isthmus. Rear-Admiral Walker, testifying before a committee of Congress, says that work can be begun within three months. The best labor will be that of the negroes of Jamaica, but there is not enough of them, and it will be necessary to obtain Chinese and Japanese. Unless the sale of liquors is permitted, he adds, it will be impossible to retain or procure the needed supply of workmen.—Secretary Taft recommends that legislative, executive, judicial and administrative power over the canal strip, under the direction of the President, be given to the Commission by Congress, as in the case of the Philippines.—John Barrett has been appointed Minister to Panama, by transfer from Argentina, where Arthur W. Beaupré, recently Minister to Colombia, takes his place. William W. Russell, now Chargé d'Affaires at Panama, and formerly Secretary of Legation in Venezuela, will succeed Mr. Beaupré at Bogota.

The Case of Senator Smoot

At the hearing in the case of Senator Smoot last week, the testimony of Mrs. Mabel Kennedy tended to show that plural marriages have been performed by the Mormon Church since the issue of the manifesto in 1890. Mrs. Kennedy said that she was married to James F. Johnson, with the consent of his first wife, in Juarez, Mexico, in 1894, by the late Apostle Brigham Young. Her mother testified that, before this ceremony, Apostle Teasdale had refused to marry the girl to Johnson, because plural marriage was no longer permitted. Francis M. Lyman, President of the Twelve Apostles, and the prospective successor of President Smith, admitted that he was now living in the polygamous relation with two wives. He knew, he said, that he was violating the law and disobeying a rule of his Church, but he intended to persist in his manner of living. His soul was much pained to find itself in opposition to law and the Church, but he must be true to the covenant he had made with his wives and God. Five other Apostles, he added, were offending in the same way. Missionaries of the Church were warned not to discuss polygamy, but they would not denounce it. In spite of the manifesto, President Smith could still authorize officers of the Church to perform plural marriages. Mr. Lyman became involved in contradictions while testifying as to revelation and inspiration. Revelations from God to the Church, he said, were not binding if the people did not approve and accept them. He asserted that he was testifying under the direction of constant inspiration. Having been led into contradictions and induced to retract a part of his testimony, he could not explain why the inspiration was so untrustworthy. Charles E. Merrill, a son of Apostle Merrill (who has 6 wives and 38 children), admitted that he was married in 1891, one of his earlier wives being then alive. He contended, however, that legislation against polygamy had virtually dissolved his marriage to this earlier wife, by whom he had four children. Bishop Thomas Merrill, another son of the Apostle, admitted that he was living with two wives, and that each of them had borne to him a child within the last three years. Similar testimony was given by Alma Merrill, his brother. President Smith testified again. He had 42 children, 21 boys and 21 girls, he said, and was "proud of every one of them." Altho he had asserted that the Church was keenly sensitive to the charge that plural marriage was still permitted and authorized, it was not his duty, he said, to inquire as to the truth of specific allegations of this kind, published in the press and relating to the conduct of one of the Apostles. E. B. Critchlow, formerly Assistant United States Attorney in Utah, narrated the history of legislation against

polygamy and of politics in Utah during the last 15 years. Mr. Smoot, he said, "by one word" could stop the practice of polygamy if he should choose to do so. President Smith, he thought, would not accept an Apostle unless the latter either practiced polygamy or believed in it. Speaking of the use of revelations, Mr. Critchlow narrated the experience of one of the Mormon cities, where the President of the State, or local head of the Church, having received 1,000 shares of stock in a corporation that desired to control the electric lighting (the people then being in favor of municipal ownership of the lighting plant), told the Mayor that he had received a revelation from God to the effect that the work must be intrusted to a private company, of which he, the recipent of the revelation, should be President. Opposition to this scheme caused the disfellowship of a number of Mormons who rejected the revelation.

Lynch Law and Riot in Ohio

The lynching of a negro named Richard Dixon, in Springfield, O., last week, was followed by the burning of twenty buildings in the negro quarter. On the 6th Dixon asked a policeman named Collis (who had been in the service twelve years and was one of the most popular members of the police force) to assist him in recovering some clothing held by a woman in whose house he had been living. Having entered the house, Dixon quarreled with the woman and shot her. Collis sought to restrain him and was shot four times by the negro, who then surrendered to the authorities and was placed in jail. Collis died at noon on the 7th. That night a mob of 1,500 persons attacked the jail, battered down the door with a railroad rail, took Dixon out, shot him to death and suspended the body from a telegraph pole, where many bullets were fired into it. Sheriff Routzahn and his deputies appear to have made no serious resistance; indeed, it is said that after the mob had forced an entrance the sheriff and his associates consented that Dixon should be taken out. Mayor Bowlus was trying to procure the aid of the local militia. Their commander, Major Kirkpatrick, told him that they were unwilling to guard the jail, fearing that they might be required to shoot some of their friends. Up to the time when Dixon was lynched only twenty of the militiamen had been induced to come to the armory. The Mayor sent to Columbus for troops, and several companies arrived on the following day. On the night of the 8th a riotous mob set fire to several buildings in the negro quarter, or Levee district, and before morning twenty buildings were destroyed, neither the militia nor the city authorities having made any serious attempt to save them. These buildings were the resort of negroes of bad character and of degraded whites who associated with them. Other buildings occupied by persons of the same class were ordered by the Mayor to be vacated. Eighteen companies of militia were on guard for a time. A special grand jury will sit for the purpose of indicting the leaders of the mob. It is said that the local courts have been unduly lenient to offenders, and that in a dozen cases of murder the guilty have escaped with only slight punishment.—At Murphysborough, Ill., on the 10th, a mob from Carbondale attacked the jail, intending to take out and lynch Thomas Vaughan, a negro held for assault upon a white woman; but Sheriff Thorpe and one deputy, armed with riot guns, not only repelled the mob but also captured three men who were in it.

The Merger Decision

On Monday the Supreme Court, by the narrow majority of 5 to 4, decided that the merger by which the Northern Securities Company purchased the controlling interest in the Northern Pacific and the Great Northern Railroad companies was a restraint of competition, and so in violation of the Sherman Anti-Trust law. This merger of the two competing companies was one of the great achievements of J. P. Morgan & Co. An action was brought in the District Court of Minnesota by the Attorney-General of the United States against the Northern Securities Company as the two railroads and was decided unanimously by the four judges in favor of the United States. An appeal was then had to the Supreme Court at Washington, and was argued in behalf of the United States by Attorney-General Knox. Judge Harlan read the

opinion sustaining the Government's contention and affirming the decision of the Circuit Court, which was concurred in by Justices Brown, Brewer, McKenna and Day, while Chief Justice Fuller and Justices White, Peckham and Holmes dissented. Justice Harlan argued that the law is constitutional and that it does not interfere with the rights of individual States. The sole question, he said, is whether this merger was a combination intended to repress commerce by shutting off competition, and as to this there could be no doubt, and it was admitted by Mr. Morgan. The court had nothing to do with the economic question of the right of competition, but only with the law forbidding restraint. If two companies can thus unite to form a monopoly in the Northwest, then all the railroads in the country can unite in the same way, and where then would be the authority of Congress over interstate commerce? The law declares illegal every combination or conspiracy in restraint of commerce between the States, and forbids attempts to monopolize such commerce; but it is indisputable that it was the purpose of the merger to create such a monopoly between the Great Lakes and Puget Sound. The dissenting opinion was read by Justice Holmes, who said there could be no more objection to the purchase of the control of the companies by the Securities Company than if their stock had been bought individually by Mr. Morgan. Justice White added that the principles of the majority decision are "destructive of government, destructive of human liberty, and destructive of every principle upon which organized society depends." President Roosevelt is greatly pleased that the Government's contention has been sustained, and the decision is regarded as a victory for his policy. The stock market was very slightly affected by the decision, which had been anticipated, and the stock of the Northern Securities Company did not decline. Mr. J. J. Hill said: "Its properties are still there; they are as good as ever."

Anglo-Spanish Arbitration Treaty

The arbitration treaty which was concluded February 27th between Spain and Great Britain is practically the same as those which have previously been negotiated with France and Italy. The most important clauses are the following:

"Article 1. Differences which may arise of a legal nature, or relating to the interpretation of treaties existing between the two contracting parties, and which it may not have been possible to settle by diplomacy, shall be referred to the Permanent Court of Arbitration established at The Hague by the convention of July 29th, 1899, provided nevertheless that they do not affect the vital interests, the independence, or the honor of the two contracting States, and do not concern the interests of third parties.

"Article 2. In each individual case the high contracting parties, before appealing to the Permanent Court of Arbitration, shall conclude a special agreement defining clearly the matter in dispute, the scope of the powers of the arbitrators, and the periods to be fixed for the formation of the arbitral tribunal and the several stages of the procedure."

It will be seen that arbitration by this agreement is made really compulsory in few if any cases, because almost any difference between two countries might be held by one of them to affect its vital interests, independence or honor or the interests of a third party, still such arbitration treaties will probably tend to prevent war by calling attention to an established method of peaceful settlement, and by delaying the appeal to arms so often accelerated by popular feeling. The group of members of the French Chamber of Deputies, which have labored so enthusiastically to promote these treaties, express the hope that similar conventions will soon be concluded between France and the United States, Holland, Norway and Sweden, Denmark and the South American republics. President Roosevelt has declared his willingness to negotiate such treaties as soon as the Senate will accept them.

The Balfour Cabinet

Mr. Chamberlain is on the Nile recuperating his health, tho the rumors of a mental breakdown are denied. In the meantime Mr. Balfour is having a difficult task to keep together a majority made up of free-traders and protectionists. The by-elections recently have favored the Liberals, and if a dissolution should be forced now, it is probable that the new Parliament would be strongly anti-Chamberlain, and Lord Spencer would

be likely to be Prime Minister in the new Cabinet. The Irish members will vote against the present Government on account of its refusal to take up the bill for a Catholic university of Ireland. The Duke of Devonshire is in open opposition, and has apologized for being connected so long with a Cabinet of whose policy he disapproved. The new army reorganization has swept away the last trace of the plans of Mr. Broderick, Secretary for England, and Lord Lansdowne, the Foreign Secretary, is also offended by its adoption. The strength of the Free-Traders was shown by the vote on a motion of a Liberal member, Mr. Duncan V. Pirie, that the House express its disapproval of the language of the Chancellor of the Exchequer (Austin Chamberlain) and other members of the Government encouraging the continued agitation in favor of protective or differential tariffs. This was lost, but by a vote of only 289 to 243. The attempt of Mr. Balfour to get an approval of the fiscal policy of the Government "as including neither a general system of protection nor preference based on the taxation of food," was not successful because the Chamberlain adherents decided to withdraw their support from the Government if the Premier thus disowned the policy of their leader.—The Association of Chambers of Commerce at its annual session adopted a resolution complaining of certain restrictions and unfair arrangements directed against the commerce of the empire and requesting a royal commission to investigate the whole fiscal policy of the nation.

The British Navy

The naval estimates presented to Parliament for the coming year amount to $184,445,500, a net increase of $12,150,000 over the appropriation for 1903-4. Half of the increase goes to pay for and equip the two battleships purchased from Chile April 1st to prevent their falling into the hands of Russia. Over $58,000,000 is to be expended on new ships. In explanation of the estimates before the House of Commons Ernest G. Pretyman, Secretary to the Admiralty, stated that the increase was necessary if the navy is to maintain the requirements of being equal to the navies of any two other Powers. Russia and France together were building 64 first and second class battleships, and France and Germany combined were building 61, while the estimates provided for Great Britain an increase of 63. The navies of other nations are, it was said, for offensive purposes, but England's navy was defensive, and it must be strong enough to protect her commerce and secure her food supply against any possible coalition of her enemies. There are more chances of war now than twenty-five years ago, and recent events in the Far East have proved the advantages of being prepared. A motion to instruct the Government to negotiate with other great Powers an agreement to diminish their shipbuilding programs was voted down, and the estimate asked for was passed, tho by the small majority of fourteen.

Port Arthur Bombarded

On March 10th, just a month from the first attack on the Port Arthur fleet by the Japanese torpedo boats, the second important action of the war took place—a general bombardment of the city, forts and fleet by the squadron under Admiral Togo. Two torpedo flotillas reached the mouth of the harbor at 1 A.M., and, finding no Russian vessels ready for them, one flotilla improved the time until dawn by sinking mines in the harbor entrance, while the other flotilla, consisting of three boats, went in search of the enemy's torpedo boats, which they found south of Port Arthur. Altho the Russian flotilla numbered six torpedo boats, the Japanese engaged them, and for half an hour there was fierce fighting, with the boats almost touching. The Russians then took refuge in the harbor. On the Japanese side the loss was seven killed and eight wounded. The other flotilla sank one of the Russian torpedo boats at the entrance to the harbor after saving its crew. The Russian cruisers "Novik" and "Boyarin" came out of the harbor, but withdrew on the approach of the Japanese cruisers and battleships, which arrived at Port Arthur at 8 A.M., and for three hours bombarded the inner harbor from a distance too great to be reached by the Russian guns and from behind the Lao-Teai-Shan promontory. A cruiser was placed at right angles to the line of fire and signaled by wireless telegraphy the result of each shot. Under these conditions the

Japanese marksmanship was much better than it had been in previous engagements, but still it overreached, and the town suffered as much as the forts and ships. Some seventy-five men altogether are reported to have been killed in the town and on board the "Sevastopol" and the "Retvizan," which is now floated but cannot be repaired so as to be seaworthy. It is said that three or four hundred of the shells used by the Japanese were Russian and had been found on the transport "Manchuria." The chief part of the cannonading was done at long range. There are twenty-four 12-inch guns in the Japanese squadron of six battleships, and each gun fired five rounds. The forts on the "Tiger's Tail" and Golden Hill were badly damaged, and the town was partly burned. Part of the Japanese fleet visited Dalny, formerly Talienwan, and now the chief Russian commercial port in Manchuria, and practically demolished it without any attempt on the part of the Russians to protect it.

The Russo-Japanese War

The Russian Minister at Pekin has informed the Chinese Government that if the Chinese troops are permitted to go beyond the Great Wall into Manchuria it will be considered a breach of neutrality. General Maa and General Yuan-Shi-Kai, with troops variously estimated to number from 10,000 upward, have been reported to be interfering with some of the railroad stations and telegraph lines of the Chinese Eastern (Manchurian) Railroad, and were suspected of hostile designs. General Yaun, of whom we gave a sketch a few weeks ago, is the successor of Li-Hung-Chang as Viceroy of the province of Chi-Li, and the troops have been organized by himself as a provincial guard; so it remains to be seen how obedient they will be to imperial orders. According to Russian accounts the Chinese soldiers are undisciplined and irresponsible bandits engaged in marauding and increasing the disorder of the country.—General Kuropatkin left St. Petersburg March 12th for Manchuria, where he will have charge of the military operations. The streets were crowded with enthusiastic people, and in the station were assembled the most important naval and military officials and attachés of the foreign embassies. General Eggrestoff gave him as he entered the car a small image of Alexis, his patron saint, which he received kneeling and reverently kissed. In response to a delegation from the Municipal Council, he said:

"It is necessary to be calm and patient. The army will make faithful efforts to accomplish the task intrusted to it by the Emperor. Slight reverses are possible. Our troops are assembling slowly, and in this everything depends on the railroad. I am firmly confident that God will respond to our prayers and bless Russian arms."

This is taken to indicate that his policy will not be an aggressive one, but that possibly the Russian army will be retired gradually toward Harbin, leaving Port Arthur and Vladivostok to stand sieges. The Japanese in that case would become exhausted in covering so large and unfertile a territory as Southern Manchuria, while the Russians would have time to bring an overwhelming force into the country.—It was reported that the Japanese had outflanked the Russians on the Yalu River and had penetrated into Manchuria as far as Fung-Wang-Ching, 45 miles northwest of Antung. This is a very remarkable achievement, if true, but at the time of going to press it is doubtful. No correspondents are as yet allowed with either army, and the censorship on both sides is strict.—Niuchwang is not to be kept open as a neutral port, but is being fortified by the Russians, and foreigners and non-combatants are leaving.—In Korea the only engagement reported was a skirmish at Kasan, 57 miles north of Ping-Yang, between the Russian and Japanese cavalry. It does not appear that there are any considerable bodies of Russian troops in Korea. The Japanese continue landing at Chemulpo and other Korean ports and pushing northward. The railroad from Seoul to Wiju is being built very rapidly by the Japanese, who apparently do not intend to attack until this is completed sufficiently to supply the army at the front. Pontoon bridges are put across the rivers, and rails and equipment are being taken from the railroads in Japan.—Vladivostok has been twice bombarded during the week, but without important results. The four Russian cruisers, formerly in Vladivostok harbor, have been reported as at sev-

eral widely separated points, but nothing authentic is known of their whereabouts.

Christianity and Christians in Japan

According to the latest reports, the number of Christians in Japan at the beginning of the year 1902 was 129,134, of whom 46,634 were Protestants, 26,680 Greek Catholics, 55,824 Roman Catholics. As the Protestant reports do not include children, but only full communicants, the total number of baptized Christians in the Empire is not far from 200,000, as yet a small proportion in a total population of forty-five millions. Relatively, Christianity is growing more rapidly now than at any previous period, and the percentage of increase is greater than that of the population. During the year 1901 the Protestants reported an increase of 4,308; the Greeks, of 983; the Roman Catholics, of 4,391, or a total of 9,682 baptized persons, but only 6,091 full communicants, being an increase of 4.6 per cent., while the population grew only at the rate of 1.5 per cent. Of the 456 Protestant organizations, 80 are financially independent. The Greek Catholics report 174 and the Roman Catholics 210 chapels and churches. Altho the bulk of the Japanese churches still receive aid from foreign missionary societies, yet both native preachers and missionaries, as a rule, have the conviction that if thrown upon its own resources Japanese Christianity would not only be able to help itself, but would flourish. Proportionally Christianity is a factor and force in the public life of the state vastly beyond its proportional numerical strength. One member of the Cabinet, two judges in the Supreme Court, two Presidents of the Lower House of Parliament, as scores of subordinate officials in the state, have been professors of Christianity. In the first Parliament out of three hundred members, the President and eleven members were Christians; fully nine times as great a representation as the relative strength in the population would admit. In the present Parliament the President and thirteen members are Christians. Altho the opposition to Christians is strong, yet members are elected even from the strongholds of Buddhism. The army records show 155 Christian officers, or about three per cent. of the total corps, and the two best battle ships are commanded by Christians. Especially in literary and educational circles Christians are a leading power. The native preacher, Kozaki Hiromichi, declares that scarcely a single book has been published during the rule of the present Emperor that does not show the influence of Christian thought. At the universities and other higher grades of schools Christian teachers and pupils are very largely represented, and the public life and thought of Japan is being gradually saturated with Christian thought and expressions.

Dr. Jameson

The triumph of the Progressive party at the recent elections has resulted in making Dr. Jameson Premier of Cape Colony, and he has selected his Cabinet for the opening of Parliament this week. He has announced that his policy will be one of conciliation, and that he will ignore racial distinctions and endeavor to administer the affairs of the Colony in accordance with the general interest of the British Empire. He said: "We are creating nothing, but are following in the footsteps of Mr. Rhodes." The task of the new Government is a difficult one, especially from the financial standpoint. The revenue returns for the seven months of the fiscal year show a decrease of $3,500,000, as compared with the corresponding period last year, and there has been much unauthorized expenditure to be made good. This brings again to the front a remarkable man, whose career was thought to be ruined when his filibustering expedition into the Transvaal in 1895 was forced to an ignominous surrender and he was tried before an English court and condemned to imprisonment. Leander Starr Jameson was born in 1853, and left Scotland for the Cape Colony to practice medicine in 1877. One of his patients was Cecil Rhodes, who found in him a lieutenant of great energy and administrative ability, and put him in charge of Rhodesia, where he led the campaigns against the Matabele in 1893.

Down with the Russians

TRANSLATED FROM THE JAPANESE

BY A. LLOYD.

[I have made the following rough translation of a poem written by one of the students of the Higher Commercial College, Tokyo. I venture to hope that it may prove interesting as throwing light on the hopes and fears that are so tumultuously at work in Japanese breasts just at this moment.—A LLOYD.]

HARK! o'er Liaotung's wintry coasts
Hear ye no wail and shriek of ghosts,
Of men who bought 'midst battle's shocks
Those yellow sands and snow-clad rocks,
While every night there comes the roar
Of raging strife the dark waves o'er?
No trace of that just war[1] remains;
But see, o'er Chosen's[2] fertile plains
Dark lowers the sky, and when to rest
The sun behind Chopaku's[3] crest
Has sunk, what fate awaits the line
That ruled so long by right divine?

Hark! At the Cossack's battle cry,
Trembles and falls as tho to die
The ancient king-craft of the East.
Say when the love that Heaven's priest,
In letters common to us all,[4]
Confucius, taught shall fade and fall,
What doom awaits the myriad folk
In those wide lands that bear the yoke?
Pity your brethren, if you can;
Rise, rise, and strike the foes of man.

When Amur's[5] stream was dyed with red,
Thousands were numbered with the dead;
Still murder wrought her deeds of hell,
And Kishineff its tale can tell
Of bloodshed. Soldiers of the Czar
They call themselves, but thieves they are;
And History, blushing, dreads to pen
Crimes that cry out to God and men.

Thou spak'st of peace: is this thy troth?
And shall the mouth that swore the oath
Now have Manchuria for its prey?
No. In the East, where the young day
First sees the world, there lies a land,
Fuso[6] by name. Her stalwart band,
With blood-stained blades, shall never cease
To offer to thy God of Peace.

When lovely Peace on Eastern shores
Her holy light once more outpours,
Then, the wise Trade God's Staff[7] in hand,
We'll build the glories of our land.
But now that, on the battlefield,
Flashes the steel, to you we yield
The post of honor. Strike apace,
Brave scions of a martial race.

TOKYO, JAPAN.

[1] *That just war—i. e.*, the war between China and Japan in which the "ghosts" lost their lives. The Japanese took Port Arthur in that war, and were much annoyed when Russia, Germany, and France compelled them to give it up.

[2] *Chosen—i. e.*, Corea.

[3] *Chopaku*—the name of the range of mountains which runs down the middle of Korea, forming a sort of backbone to the peninsula.

[4] *In letters common to us all—i. e.*, the Chinese script, which is used equally by Japanese, Chinese and Koreans. Confucius is equally reverenced in all three countries.

[5] *Amur's stream*—the reference is to the massacres at Blagovestchenk.

[6] *Fuso*—a poetical name for Japan.

[7] *The Trade God's staff*—Mercury's staff is the badge of the Higher Commercial College.

The Race Problem—An Autobiography

BY A SOUTHERN COLORED WOMAN

[The present article and the two following ones on the negro problem which we print this week are respectively by a Southern colored woman, a Southern white woman, and a Northern white woman now a resident of the South. We know of no women in the whole South better qualified to write on this painful topic from their various standpoints. The articles are especially timely owing to last week's race war in Ohio, and are remarkable for their extraordinary frankness. For reasons that will be evident to the reader and that concern their social if not personal safety, the names of the writers are withheld.—EDITOR.]

MY father was slave in name only, his father and master being the same. He lived on a large plantation and knew many useful things. The blacksmith shop was the place he liked best, and he was allowed to go there and make little tools as a child. He became an expert blacksmith before he was grown. Before the war closed he had married and was the father of one child. When his father wanted him to remain on the plantation after the war, he refused because the wages offered were too small. The old man would not even promise an increase later; so my father left in a wagon he had made with his own hands, drawn by a horse he had bought from a passing horse drover with his own money.

He had in his wagon his wife and baby, some blacksmith tools he had made from time to time, bedding, their clothing, some food, and twenty dollars in his pocket. As he drove by the house he got out of the wagon to bid his father goodby. The old man came down the steps and, pointing in the direction of the gate, said: "Joseph, when you get on the outside of that gate—stay." Turning to my mother, he said: "When you get hungry and need clothes for yourself and the baby, as you are sure to do, come to me," and he pitched a bag of silver in her lap, which my father immediately took and placed at his father's feet on the steps and said, "I am going to feed and clothe them and I can do it on a bare rock." My father drove twenty-five miles to the largest town in the State, where he succeeded in renting a small house.

The next day he went out to buy something to eat. On his way home a lady offered him fifty cents for a string of fish for which he had only paid twenty cents. That gave him an idea. Why not buy fish every day and sell them? He had thought to get work at his trade, but here was money to be made and quickly. So from buying a few strings of fish he soon saved enough to buy a wagon load of fish.

My mother was very helpless, never having done anything in her life except needlework. She was unfitted for the hard work, and most of this my father did. He taught my mother to cook, and he would wash and iron himself at night.

Many discouraging things happened to them—often sales were slow and fish would spoil; many would not buy of him because he was colored; another baby was born and died, and my father came very near losing his life for whipping a white man who insulted my mother. He got out of the affair finally, but had to take on a heavy debt, besides giving up all of his hard earned savings.

My father said after the war his ambition was first to educate himself and family, then to own a white house with green blinds, as much like his father's as possible, and to support his family by his own efforts; never to allow his wife and daughters to be thrown in contact with Southern white men in their homes. He succeeded.

The American Missionary Association had opened schools by this time, and my father went to night school and sent his wife and child to school in the day.

By hard work and strict economy two years after he left his father's plantation he gave two hundred dollars for a large plot of ground on a high hill on the outskirts of the town.

Three years later I was born in my father's own home, in his coveted white house with green blinds—his father's

house in miniature. Here my father kept a small store, was burned out once and had other trials, but finally he had a large grocery store and feed store attached.

I have never lived in a rented house except for one year since I've been grown. I have never gone to a public school in my life, my parents preferring the teaching of the patient "New England schoolmarm" to the Southern "poor white," who thought it little better than a disgrace to teach colored children—so much of a disgrace that she taught her pupils not to speak to her on the streets. My mother and her children never performed any labor outside of my father's and their own homes.

To-day I have the same feeling my parents had. There is no sacrifice I would not make, no hardship I would not undergo rather than allow my daughters to go in service where they would be thrown constantly in contact with Southern white men, for they consider the colored girl their special prey.

It is commonly said that no girl or woman receives a certain kind of insult unless she invites it. That does not apply to a colored girl and woman in the South. The color of her face alone is sufficient invitation to the Southern white man—these same men who profess horror that a white gentleman can entertain a colored one at his table. Out of sight of their own women they are willing and anxious to entertain colored women in various ways. Few colored girls reach the age of sixteen without receiving advances from them—maybe from a young "upstart," and often from a man old enough to be their father, a white haired veteran of sin. Yes, and men high in position, whose wives and daughters are leaders of society. I have had a clerk in a store hold my hand as I gave him the money for some purchase and utter some vile request; a shoe man to take liberties, a man in a crowd to place his hands on my person, others to follow me to my very door, a school director to assure me a position if I did his bidding.

It is true these particular men never insulted me but once; but there are others. I might write more along this line and worse things—how a white man of high standing will systematically set out to entrap a colored girl—but my identification would be assured in some quarters. My husband was also educated in an American Missionary Association school (God bless the name!), and after graduating took a course in medicine in another school. He has practiced medicine now for over ten years. By most frugal living and strict economy he saved enough to buy for a home a house of four rooms, which has since been increased to eight. Since our marriage we have bought and paid for two other places, which we rent. My husband's collections average one hundred dollars a month. We have an iron-bound rule that we must save at least fifty dollars a month. Some months we lay by more, but never less. We do not find this very hard to do with the rent from our places, and as I do all of my work except the washing and ironing.

We have three children, two old enough for school. I try to be a good and useful neighbor and friend to those who will allow me. I would be contented and happy if I, an American citizen, could say as Axel Jarlson (the Swedish emigrant, whose story appeared in THE INDEPENDENT of January 8th, 1903) says, "There are no aristocrats to push him down and say that he is not worthy because his father was poor." There are "aristocrats" to push me and mine down and say we are not worthy because we are colored. The Chinaman, Lee Chew, ends his article in THE INDEPENDENT of February 19th, 1903, by saying, "Under the circumstances how can I call this my home, and how can any one blame me if I take my money and go back to my village in China?"

Happy Chinaman! Fortunate Lee Chew! You can go back to your village and enjoy your money. This is my village, my home, yet am I an outcast. See what an outcast! Not long since I visited a Southern city where the "Jim Crow" car law is enforced. I did not know of this law, and on boarding an electric car took the most convenient seat. The conductor yelled, "What do you mean? Niggers don't sit with white folks down here. You must have come from 'way up yonder. I'm not Roosevelt. We don't sit with niggers, much less eat with them."

I was astonished and said, "I am a stranger and did not know of your law." His answer was: "Well, no back talk now; that's what I'm here for—to tell niggers their places when they don't know them."

Every white man, woman and child was in a titter of laughter by this time at what they considered the conductor's wit.

These Southern men and women, who pride themselves on their fine sense of feeling, had no feeling for my embarrassment and unmerited insult, and when I asked the conductor to stop the car that I might get off, one woman said in a loud voice, "These niggers get more impudent every day; she doesn't want to sit where she belongs."

No one of them thought that I was embarrassed, wounded and outraged by the loud, brutal talk of the conductor and the sneering, contemptuous expressions on their own faces. They considered me "impudent" when I only wanted to be alone that I might conquer my emotion. I was nervous and blinded by tears of mortification which will account for my second insult on this same day.

I walked downtown to attend to some business and had to take an elevator in an office building. I stood waiting for the elevator, and when the others, all of whom were white, got in I made a move to go in also, and the boy shut the cage door in my face. I thought the elevator was too crowded and waited; the same thing happened the second time. I would have walked up, but I was going to the fifth story, and my long walk downtown had tired me. The third time the elevator came down the boy pointed to a sign and said, "I guess you can't read; but niggers don't ride in this elevator; we're white folks here, we are. Go to the back and you'll find an elevator for freight and niggers."

The occupants of the elevator also enjoyed themselves at my expense. This second insult in one day seemed more than I could bear. I could transact no business in my frame of mind, so I slowly took the long walk back to the suburbs of the city, where I was stopping.

My feelings were doubly crushed and in my heart, I fear, I rebelled not only against man but God. I have been humiliated and insulted often, but I never get used to it; it is new each time, and stings and hurts more and more.

The very first humiliation I received I remember very distinctly to this day. It was when I was very young. A little girl playmate said to me: "I like to come over to your house to play, we have such good times, and your ma has such good preserves; but don't you tell my ma I eat over here. My ma says you all are nice, clean folks and she'd rather live by you than the white people we moved away from; for you don't borrow things. I know she would whip me if I ate with you, tho, because you are colored, you know."

I was very angry and forgot she was my guest, but told her to go home and bring my ma's sugar home her ma borrowed, and the rice they were always wanting a cup of.

After she had gone home I threw myself upon the ground and cried, for I liked the little girl, and until then I did not know that being "colored" made a difference. I am not sure I knew anything about "colored." I was very young and I know now I had been shielded from all unpleasantness.

My mother found me in tears and I asked her why was I colored, and couldn't little girls eat with me and let their mothers know it.

My mother got the whole story from me, but she couldn't satisfy me with her explanation—or, rather, lack of explanation. The little girl came often to play with me after that and we were little friends again, but we never had any more play dinners. I could not reconcile the fact that she and her people could borrow and eat our rice in their own house and not sit at my table and eat my mother's good, sweet preserves.

The second shock I received was horrible to me at the time. I had not gotten used to real horrible things then. The history of Christian men selling helpless men and women's children to far distant States was unknown to me; a number of men burning another chained to a post an impossibility, the whipping of a grown woman by a strong man unthought of. I was only a child, but I remember to this day what a shock I received. A young colored woman of a lovely disposition and character had just died. She

was a teacher in the Sunday school I attended—a self-sacrificing, noble young woman who had been loved by many. Her coffin, room, hall, and even the porch of her house were filled with flowers sent by her friends. There were lovely designs sent by the more prosperous and simple bouquets made by untrained, childish hands. I was on my way with my own last offering of love, when I was met by quite a number of white boys and girls. A girl of about fifteen years said to me, "More flowers for that dead nigger? I never saw such a to-do made over a dead nigger before. Why, there must be thousands of roses alone in that house. I've been standing out here for hours and there has been a continual stream of niggers carrying flowers, and beautiful ones, too, and what makes me madder than anything else, those Yankee teachers carried flowers, too!" I, a little girl, with my heart full of sadness for the death of my friend, could make no answer to these big, heartless boys and girls, who threw stones after me as I ran from them.

When I reached home I could not talk for emotion. My mother was astonished when I found voice to tell her I was not crying because of the death of Miss W., but because I could not do something, anything, to avenge the insult to her dead body. I remember the strongest feeling I had was one of revenge. I wanted even to kill that particular girl or do something to hurt her. I was unhappy for days. I was told that they were heartless, but that I was even worse, and that Miss W. would be the first to condemn me could she speak.

That one encounter made a deep impression on my childish heart; it has been with me throughout the years. I have known real horrors since, but none left a greater impression on me.

My mother used to tell me if I were a good little girl everybody would love me, and if I always used nice manners it would make others show the same to me.

I believed that literally until I entered school, when the many encounters I had with white boys and girls going to and from school made me seriously doubt that goodness and manners were needed in this world. The white children I knew grew meaner as they grew older—more capable of saying things that cut and wound.

I was often told by white children whose parents rented houses: "You think you are white because your folks own their own home; but you ain't, you're a nigger just the same, and my pa says if he had his rights he would own niggers like you, and your home, too."

A child's feelings are easily wounded, and day after day I carried a sad heart. To-day I carry a sad heart on account of my children. What is to become of them? The Southern whites dislike more and more the educated colored man. They hate the intelligent colored man who is accumulating something. The respectable, intelligent colored people are "carefully unknown"; their good traits and virtues are never mentioned. On the other hand, the ignorant and vicious are carefully known and all of their traits cried aloud.

In the natural order of things our children will be better educated than we, they will have our accumulations and their own. With the added dislike and hatred of the white man, I shudder to think of the outcome.

In this part of the country, where the Golden Rule is obsolete, the commandment, "Love thy neighbor as thyself" is forgotten; anything is possible.

I dread to see my children grow. I know not their fate. Where the white girl has one temptation, mine will have many. Where the white boy has every opportunity and protection, mine will have few opportunities and no protection. It does not matter how good or wise my children may be, they are colored. When I have said that, all is said. Everything is forgiven in the South but color.

Experiences of the Race Problem

BY A SOUTHERN WHITE WOMAN

MY father was the son of a Southern gentleman. Everybody knows the type—a man of courage and grace, more natural than ethical, not quite "up in his morals," but with superlative virtues that surpassed mere morality. The county I was born in and the nearby town were named for him. He was a member of the State Senate and had the proverbial "hundred negroes."

My father entered the Confederate army when he was sixteen, and walked home from Virginia four years later a ragged, dusty, defeated soldier, with some honorable scars and considerable family pride. But that was all he had. Negroes and lands had vanished. His father was dead and the State Government was in the hands of the "carpet-baggers."

He was so reduced, indeed, that nothing was left for him to do but to go a courting. And he has often told me that the next three years were the most strenuous of his life. There were many beautiful girls in the county deprived until now of lovers, and it was my father's gallant ambition to supply them all with at least one. This led to an impromptu duel later on, when one of the girls married without burning my father's letters. The angry bridegroom did most of the shooting, I believe.

About this time he joined the Ku Klux Klan, and with other of his neighbors set about disciplining the negroes into a proper understanding of the Southern gentleman's idea of their freedom, more especially its limitations. This had been very thoroughly accomplished by the time I was born, in 1869. He had regained possession of the family estate by this time, a large plantation, and had it thickly settled with negro families, whose conduct and industry were all that could be demanded even by the most exacting landlord.

From the foregoing those who comprehend Southern conditions will understand at once that I belong to a class in the South who know the negro only as a servant. My experience is limited to the average individual of the race. The "educated negro" is an artificial production, which does not fit in with our natural order, and for this reason no distance is so wide as that between the people of my class and aspiring, wronged, intelligent, vindictive negroes. Just now we have much agitation among us concerning the redemption and education of ignorant negroes in the South, but it should be borne in mind that the very men and women who are exercising their spiritual faculties in this philanthropic way show upon the slightest provocation an intense race antipathy toward individuals of the very class they are attempting to create. There was not a Southerner present at the Richmond convention, where plans for the betterment of these people were discussed, who would publicly voluntarily have dined with Booker Washington or Bishop Turner, two of the noblest men the South has ever produced, because they are both negroes. Our race sincerity commits us to this social and ethical inconsistency, and for one I expect the aboriginal sincerity to outlast the moral stringency of our present attitude.

But if we get our notions of negroes from the servant class, the educated negro gets his conception of the white man's character largely from the lower orders of society. The best he can do socially is to meet the factory elements, say, on their terms of insolent inequality. And the proof of the negro's innate vulgarity is that he is willing to do so. No matter how respectable he may be himself in character and intelligence, he will welcome to his board and hearth the meanest whites and feel complimented at their presence. I think our old Mammy had a better notion of self respect. "I wouldn't set down to the table wid no white person as would ax me," she used to say, "for I'd know by dat dey was pure white trash and not fitten for me to notice!"

Our plantation was five miles from the nearest town. And as it was the social custom of that neighborhood for the best families to exchange stately visits only once or twice a year, it often happened that for two or three months I saw no one but my father and mother and the negroes on the place. The little black girls of my own age were the only playmates I had. And altho I imagined our companionship free from restraint, I know now that it was really controlled by the instincts and customs of our respective races. For instance, I never sought any playmates in the cabins where they lived, and I would no more have played with them in their own yards than I would now contemplate the lowest social connections. But they came to the "big 'ouse," and from that social eminence we ranged the country far and wide in search of childish adventures. And while I would not have taken a drink of water from a gourd after one of them, or eaten bread from a cabin, I was taught never to call them "niggers," or to hurt their feelings by referring to the quality of their hair. And I have never in my whole life used any expression in the presence of a negro that touched upon a mortifying race distinction. I have never discussed the "race problem" at a table where negroes served me, nor indulged in any conversation that could wound their sensibilities. And when I was a child, if I had struck one of my little black companions, I should have been severely punished.

Fortunately, I was never tempted to treat them unkindly. There was no question of "fair play" between us; for quite naturally I took all the advantages there were to be had. If we played "keeping house," I was the father and the mother of the family, they the children, subject to the most stringent discipline. But we never played "come to see" one another, because they were negroes, and we felt the social impropriety of such a situation as that fact involved. If we played "horse"—and I regret to say that we did—they were the horses, I the driver. And not for the pleasure of being the wildest colt in the team would I have exchanged *rôles* and permitted one of them to drive me. In this connection I recall one young negro girl much stronger than the others, who, by getting down upon her hands and knees, could make of herself such a vicious "horse" that none of us was able to stay on her back. But the effort to do so was an experience I ever coveted. I would seat myself firmly, clasp my hands tightly in the wool on the back of her head, and wait for the delicious sensation of feeling her take a running, plunging start that invariably landed me over her head somewhere in the grass. I was often severely bruised and obliged to retire to my mother for ointments. But I never told the truth about the cause of my disasters. For in that case the girl would not only have been punished, but banished, and that was a loss I refused to contemplate.

With one exception all the little black boys on the plantation wore what were called "shirt tails," and nothing else. These were long, straight garments made of coarse white cloth and split to the knees. These ridiculous looking little wretches never came near us. Even the black girls professed to hold them in contempt, and used to shout the most appalling sarcasms at them if one appeared anywhere upon our horizon.

But the "exception" was a little mulatto boy, who not only wore trousers, but a hat. He had very bad "manners," and had even gone to the front door once when he was sent to the "big 'ouse" on an errand. Without knowing why one negro was black and another yellow I conceived a violent antipathy for this child,—for no other reason that I can now remember except that he had blue eyes and was "sulky." Therefore, one day I filled an atomizer with ink, and when he came as usual for a pitcher of milk I held him against the wall and sprayed his face until it was of a uniform, legitimate blackness. He ran bawling to my mother, and I expected punishment, but I felt the job was fully worth the pain I should suffer, and I followed with more pride than I could conceal. My mother was regarding the victim with a face that expressed no more emotion than a mask. Presently she called a servant and said: "Take that child to his mother. Tell her he is nearer the right color than I ever saw him before, and tell her he is never to come into my sight again." And he never

did. But when I was married, a dozen years later, he was still on the plantation, a yellow Ishmael, who worked when he chose and fought whenever opportunity offered, a veritable marplot to the peace of the place.

I had no brothers, and for this reason my father intrusted certain details connected with the management of the place to me at an early age. For instance, I attended to the weighing of "rations" on Saturday afternoon. To each of a score of hired hands was given three pounds of bacon, a peck of meal and a quart of sorghum (syrup made from sorghum cane). This was a business that brought out my preferences more than it developed my sense of justice. I gave the men I liked best more than the exact measure, and at the age of ten I will confess that I was easily bribed. A lump of fragrant sweet gum, a young squirrel, or my apron pocket filled with partridge eggs so prejudiced me that I invariably tipped the scales in favor of the giver. My sense of equity had an entirely romantic basis. I remember giving a young black bridegroom an extra quart of sorghum, and when a man with a large family protested at this partiality I replied: "But he married our house girl and she is used to sweet things!" However, when the dark honeymoon of their happiness terminated a month later in a fight, and the bride went home in high dudgeon to her people, I was so indignant that I wished to cut the bereaved husband off with no syrup at all.

In many similar ways I came in contact with the older negroes on the place, and upon all occasions, tho often unattended, my presence insured the uttermost propriety of conduct. If a young buck so far forgot himself as to laugh loudly he was "cuffed" and admonished to "mind his manners." I have very good reason for believing that these negroes had an almost romantic devotion to my father and his family. Personally I never passed judgment upon them. So far as I knew God had done that when he made me white and them black. Naturally that fixed the basis of our relationship. I had an affection for them, but there was not the least conception of equality in it. I was not taught these race distinctions, I was born with them, and I notice that they are intensified in each succeeding generation of white children. The curious thing to me is that the negro does not have them. His animosity against the whites is the forced response to our antipathy. He would have no such sensation, given social recognition, because he has no sense of race integrity.

By the time I was fourteen years of age the first set of free-born negroes were getting old enough to interpret life for themselves, and without the well disciplined experience of their parents, who had not only been slaves, but had passed through the very drastic training of the Ku Klux Klans after the war. Occasionally, therefore, one of them gave a white man some "impudence" and had to be dealt with accordingly. I remember a young negro man suddenly turned upon my father one day with an ax and would have killed him but for the intervention of another man. The boy escaped, but my father and his neighbors rode after him all night with dogs. The next morning they passed our house with him, entered the forest beyond, and, having tied him to a tree, gave him a severe whipping. But that was all. Nothing further was ever said of the incident, and the man remained in my father's employ years afterward.

Still, the fight was on, the long, long battle that will never end now until one race or the other is absolute. Little by little a resistance sprung up between the newborn freedom-bred negroes and the former slave owners of the South, a resistance ever punished and ever renewed. Crimes never dreamed of before were committed. For the utter depravity of the negro was not developed during the period of his slavery. He lacked then the liberty to practice thoroughly all the evils of his degenerate nature.

Aside from the intangible fears of childhood the first realization I ever had of horror was when one morning word came that a planter living only a few miles distant had been coaxed from his home during the night and murdered in his own yard, after which the negro assaulted both his wife and daughter. From that day until this I have a revulsion and a terror of negro men that are well nigh uncontrollable. During the fifteen years following my first realization of

the situation of Southern white women, these crimes were so frequent in the State where I live that white women were never left alone even during the day in country houses, and rural schools were made a failure, because parents were unwilling to risk the lives of their children upon the public highways. And the effect upon the young white men of the South was to arouse a bloodthirstiness in them for vengeance that shocked the civilized world. There are many accursed trees and charred stumps to be seen by the roadsides in this State where negroes have been lynched or burned. The relations existing between the two races became absolutely inhuman. The smallest pretext was reason enough for taking a black man's life. Not long ago, as I sat in a railway station, a crowd of whites ran past firing pistols and shouting threats. They were chasing a negro who had offended one of them with a blasphemous comment upon white character. In the town where I now live a negro man who had been guilty of some small offense escaped from his captors last year and jumped into the river nearby. His pursuers stood on the banks and shot him to death, altho it was already impossible for him to escape. And no later than yesterday, when I asked the meaning of successive pistol shots heard at no great distance, I was told that they were fired by young white boys at "little niggers." The general impression prevailed that somebody would be "hurt." But if the situation had been reversed, and negroes were firing, however aimlessly, at white boys, a mob would have gathered at once.

Meanwhile, the criminal career of this race is progressing rapidly Northward. The crimes that first excited the fury of Southerners against them are decreasing here so much that now they are committed almost as frequently in those sections of the North where negroes have immigrated. And they are followed by the same fever for lynching in the whites there that has long maddened Southerners. The truth is that within a very few years the negro will be the most cordially hated man in this world. Once his abolitionist friends get a rational conception of his character they invariably desert him. And the whole trouble North and South comes from a disposition to hold the negro morally accountable, when really he belongs to a decadent race, which taints every other it comes in contact with, and is of itself incapable of regeneration.

And so degeneracy is apt to show most in the weaker individuals of any race; so negro women evidence more nearly the popular idea of total depravity than the men do. They are so nearly all lacking in virtue that the color of a negro woman's skin is generally taken (and quite correctly) as a guarantee of her immorality. On the whole, I think they are the greatest menace possible to the moral life of any community where they live. And they are evidently the chief instruments of the degradation of the men of their own race. When a man's mother, wife and daughters are all immoral women, there is no room in his fallen nature for the aspiration of honor and virtue. He is bereaved of hope and a pride that even the worst white man always has to stimulate him to decency. I sometimes read of virtuous negro women, hear of them, but the idea is absolutely inconceivable to me. I do not deny they exist, but after living in a section all my life that teems with negroes I cannot imagine such a creation as a virtuous black woman.

There must be exceptions, of course, but as a rule education is a superficial experience with the negro. My own observations convince me that the blacks have a uniformity of character and disposition that education does not change, but intensifies. To vary from the monotony of stupidity in my servants not long ago I employed successively two college graduates. But I did not notice any essential difference in character. Both were manifestly immoral and they had deceit down to a fine art. In illiterate negroes these vices seem so natural they fail to shock the sensibilities or to excite aversion, but I conceived a horror of these yellow Jezebels, who had come to me from schools that have million-dollar endowments for the education of negro girls.

The reason why Northerners fail to comprehend the almost universal depravity of negroes is because they mistake the very high moral tone of the negro's conversation as an evidence of virtue. These people are very quick at catching

a tune of any kind, mental or musical, and they like the noble sound of ethics as much as they enjoy musical harmony. Thus, it is very rare, indeed, to find a negro who does not shine in a religious discussion. They have, however, more piety of imagination than of character. Recently a negro woman who has never been married, but has three different kinds of children, posed so pathetically as a virtuous, hard working "widow" to a Northern visitor here that she received quite a handsome sum from him. The innocency of his comments so touched the humor of the town that half a dozen other "widows" of similar reputation were directed to his attention, all of whom he succored with the tenderest compassion.

And, finally, it is never wise to judge a race by individuals, but by those evidences common to the whole mass of it. And, regarded from this standpoint, the negroes are at their worst. No other people are so heartless in their discriminations against one another. Their very aspirations are mean. I know of two "colored churches" where black skinned negroes are not eligible to membership. Social distinctions depend with them upon externals, not character. They have no *right* sense of honor or virtue. Recently I sat in the auditorium of a great negro university, and of the two or three hundred students present I saw only four full blooded negroes. Nearly all were mulattoes or octoroons, the offspring of negro women, but *not* of negro men. Whatever this intimates of the Southern white man's morals, it teaches two things clearly—that negro men are rarely the fathers of those individuals in the race who develop to any marked degree intellectually, and that negro women who are prostitutes are the mothers of these ambitious sons and daughters. In short, the whole race aspires upward chiefly through the immorality of the superior race above it. I do not know a more suggestive intimation of the real quality of the negro's nature and disposition than this. A mulatto girl expressed the whole economy and ambition of her people the other day when a full blooded negro called her a "stuck up nigger." "Maybe I is," she retorted, "but I thanks my God I ain't er out an' out nigger sech as you is!" And that is what they are all thankful for who have a drop of white blood to boast of. It is the measure of their quality and degradation that they can be proud of a dishonor which lightens the color of their skin.

Observations of the Southern Race Feeling

BY A NORTHERN WOMAN

I AM a native of the Northwest. My father was a college boy at the time of the Civil War, and, coming West a year or two after his graduation, he fell a victim first to fever and then to a disease whose most pronounced symptom was loss of memory—of his "college widow," and somewhat later he married the girl to whom the attack of this malady was solely due. The only ex-soldier in my immediate family was the young man who, after the establishment of peace, married my mother's oldest sister. This is probably one reason why my childhood was not enveloped in an especially polemical atmosphere, but even had my father and uncles all been "boys in blue," I fancy that I should have grown up with not very different feelings in regard to the South and the war. The people of the Northwest, with a new country to subdue and develop, and in the stress and zest of such a life and its promise for the future, had neither time nor desire to fill the minds of their children with thoughts of a war which was ended before they were born. Of course, I liked to hear stories of the war (altho my grandfather had an assortment of "wolf stories" which thrilled me far more),

and I took it for granted that the South must have been wrong, while my political sympathies—politics and theology being subjects of profound concern with me at one period of my extreme youth—were naturally colored by my nativity in a State strongly Republican. But the point which I wish to emphasize as a preface to what I am about to say is that the war stories were only *stories* to me, and that, like the other young Westerners of my generation, I grew up more nearly free from sectional prejudice than perhaps would have been possible had I been reared in any of the longer settled States. I do not claim any peculiar virtue for myself or my fellow Westerners in this. We have had too many interests and ambitions of other sorts to allow us to *care* greatly for what we have considered practically dead issues, and I for one hardly knew that there *was* a negro question until I went South to live.

There is the most widespread misapprehension in the South upon two points—the sentiment of Northerners toward the Southern people, and the modifications which that sentiment undergoes after a visit to the South. I have spoken of conditions which have tended to lessen prejudice in the Northwest; I believe that I am not mistaken in saying that in Eastern and Western States alike there has been another agency at work whose effect has been to create interest in and sympathy with the Southern white people, rather than to prolong hostility. That agency has been the rise of Southern literature.

From the talk of my elders I am led to believe that in ante-bellum days the good people of the North, tho they outwardly reprobated, secretly were fascinated by the splendid lavishness of the "old plantation days" as a thing belonging to a beautiful (altho depraved) world apart from their "plain living and high thinking." And when, in these latter days, the novel and the short story of Southern life began to appear, they were welcomed so enthusiastically that from the first appearance of Cable's works up to the present hour no one school of American literature has been so much the fashion as the Southern school.

Southerners have small idea of the degree of romantic interest with which they are regarded by those of the North, especially of the fiction-reading classes. But I am not so sure that better acquaintance with the real South would increase Northern tolerance for its ideals and mode of life. At least that has not been my experience. No one could have gone to a new country with more amiable intentions or more filled with rose-colored expectations as to place and people than was I when I set out for the Southern city where I have lived for some years past. If I had gone there to teach negroes, or under conditions which would have brought me into contact with the worst side of the white population, there would be good reason to accuse me of having formed my opinions under the influence of pique at personal slights and snubs (which I should certainly have received had I served in the former capacity), or from acquaintance with the lower classes; but my acquaintances belong to what admittedly represents the best of blood and culture in the South, and it is the people who invite me to dinner who have furnished the most of the material for whatever sentiments I now entertain upon the negro and other questions concerning which North and South are at variance.

One of the first shocks which I received, and which has been repeated so often that I suppose it ought by this time to have ceased to be a shock, was in respect to something to which reference is made in one of the preceding articles. If its author has never discussed the race question before colored auditors or made the inferiority of the negro the topic of conversation at her table before colored servants she has cause for just pride. If my own experiences furnish any ground for conclusions, there is neither man nor woman like her in the whole length and breadth of the South. I have long ceased to be surprised at this talk, which seems peculiarly inspired by a dining-room atmosphere, but to this day I have an impulse to "duck" my head to avoid the dishes which I feel must inevitably fly at some of the white conversationalists. That they never do fly seemed to me at first a proof that self-control at least could be set down to the credit of the colored race, but I am assured by "those who know the negro best" that it is a

proof of his profound inferiority that he "has not spirit enough" to resent insults which a white man would avenge with promptness and finality.

The first time, too, that I heard a lady of supposed Christianity and culture defend the thesis that negro mothers could not possibly love their children as white mothers do, because of their lack of all the finer and nobler sentiments which enter into real love, I did not take her views as representing overmuch intelligent reflection, because the same woman, among other things, had said to me at her own table that "any one could see that Northern young women, educated in co-educational schools, were not as modest and had not such ladylike manners as our Southern girls." But I discovered that no very different theory was held by people whose judgment in other matters I respected, and whose standard of "ladylike manners" did not differ so essentially as hers from my primitive Western one.

Generally speaking, my associations in the South have been of a sort to impress me more with the white man's attitude toward the negro than with any other side of the question, but I cannot believe that for this reason my view is a wholly one-sided one, or founded upon that ignorance of the real conditions which is the Southerner's stock-in-trade of argument against his Northern critic. For I consider the state of white sentiment in the South to be the supremely important factor in the problem. Even if all that has been said of universal negro ignorance, thriftlessness and beastly immorality were true, the destiny of the theoretically free black man is still so largely in the white man's hand that the danger—and that it is becoming a serious one I cannot doubt—lies much less in the brutal instincts of the negro than in the white man's blind adherence to a policy which must surely aggravate those instincts.

The whole Southern creed is contained in two words: *White supremacy*. They admit that the maintenance of this does not square in all details with "the ethical theories of Northern sentimentalists." To our Northerner (who has heard herself accused by Southerners of anything rather than too much sentiment) it seems to square even less with the practical and the possible. If I may be allowed a somewhat startling comparison, the Southerner's position on the negro is about the same as his attitude toward woman; he will treat the former with kindness, as he will the latter with adulation, "in his place." That "place" in either case, stripped of the accidental externals which make the one seem menial and the other exalted, means dependence and helpfulness. Southerners like to tell you that all negro depravity has developed since emancipation. The "old mammy" is the object not only of much show of sentiment but of real affection; in the recent Confederate reunion the crowd went wild over the gray-haired negro who walked by his "old master's" side as he had done all through the war; and yet, if we may believe stories told by Southerners themselves, horrible uprisings of the half-savage plantation hands were by no means an unknown thing in slavery times. But, however successful the old slaveholders may have been in producing irreproachable negro character, their children of to-day, now over-indulgent and now over-cruel, make no effort to train their colored hirelings to be self-respecting wage-earners or to develop in them a sense of honor and independence—and then they tell you how negroes steal! "Well, I can't find a bit of my monogram note-paper," said a friend to me last winter. "I suppose Daisy (the nurse) has used it all up. Dear no! I never say anything to her about it—she always uses our note-paper and stamps. I wouldn't be so mean as not to let the poor thing have paper to write to her beaux."

It may be "Yankee stinginess," but I confess that it never had occurred to me to supply stamps and fine note-paper for my chambermaid. Perhaps no better example than this of the difference between Northern and Southern treatment of the negro could be cited. If a servant appropriated my postage stamps she would hear from me, but I do not grudge her and her race what *I* consider the more valuable tribute of saying that personally I have not found them the universal thieves that they are represented. I have lived principally in boarding-houses, where my room has been open all day, not only to the house servants but to the horde of washerwomen, nurses and other uncataloged negroes who swarm about

a large Southern house, and twice only during my entire residence in the South have I had anything stolen from me. In one case the culprit was never discovered, but in the other and more serious one all the missing articles were found in the trunk of a white maid of German parentage. As with dishonesty, so with immorality. I have yet to discover among Southern whites the slightest effort to correct this evil. I have heard refined ladies discuss in their parlors as something deliciously amusing the amours of their cooks and house-girls. It seems a pity that they take so much more solemn a view of these affairs when they recite them for publication. And their lack of experience with white servants makes them ascribe solely to colored women what, unfortunately, is not unknown among white ones of the same class. One of my friends, disgusted with negro servants, thought to usher in a household millennium by the employment of two white girls of pleasing appearance. Within a few months she had discharged them both because of their undoubted and shameless immorality, and a talk with the mother of one of them revealed a state of things in their social circle which made it a cause for thankfulness that in estimating the purity of Anglo-Saxon womanhood people do not reason, as they do with our colored sisters, from the bottom up. Of course, this " You're another " sort of argument does not really prove anything, and yet, whatever justification there may be for " Jim Crow " street cars, I fail to perceive any for providing separate moral standards as well as separate seats for the two races. Whenever anything like the " Booker Washington incident " touches off the powder in the " social equality " cannon there is a discharge of virtuous eloquence from the editorial page of every Southern paper, calling upon the people of the South to " highly resolve " to save their noble race from degeneration through the scandal of miscegenation. For the life of me I cannot see why the breaking of bread with a colored gentleman should logically result in an epidemic of marriage between white girls and black men; in fact, the intermarriage of the races to any appreciable extent seems to me the last thing likely to happen; but if it is true that the only negroes of any promise are those of mixed blood, why object to elevating the colored race by doing legally what has been going on illegitimately for generations? Does it make the sin so much less offensive to Southern ideals of virtue that hitherto one-half of the parties to the crime have been gentlemen endowed with " superlative virtues that surpass mere morality? "

The truth is, the Southerner, no less than the Northerner, has a collection of negro theories, and upon all occasions he brings them out draped in the same lurid rhetoric, and arranges them as a screen behind which to conceal his relentless purpose to deny the negro every right and every pleasure which resemble those of the white man.

Let me give a few examples of how he denies them. During the bicycle craze our cook, a neat and modest appearing mulatto of perhaps thirty-five, asked one evening to borrow my bicycle pump, adding that she had left hers at home and dared not go to the bicycle shop nearby because of the insulting speeches of the white men who frequented it. A few years ago a class in a colored school happened to select and display the same colors as a class in a white institution in the same city. The result was a small riot growing out of the prompt avenging of their outraged dignity by the young white *gentlemen,* and the most embarrassing feature in the disciplining of the latter was found in the fact that nearly all were supported in their resolve to maintain their " honor " by their parents, all " leading citizens."

These petty tyrannies are in a way more indicative of the real Southern spirit toward the colored people than some of the affairs which get into the papers, because they show how strong is the tendency to persecute the negro for acts inoffensive and naturally attendant upon the " pursuit of happiness." And murder is committed by the rougher white element with as little excuse as insult is offered by the better classes.

One Christmas night a well dressed colored man, sober and peaceable, was shot down in front of our house by three white men, who escaped without the slightest attempt at pursuit, and the murder was scarcely noticed in the next morning's papers. Fancy what would have happened had the colors of the actors

in this little Christmas drama been reversed.

Last February an unknown negro engaged a room in a cheap lodging-house in the "downtown" district of New Orleans. The Mardi-Gras season brought in an influx of visitors to this as to the hotels of the fashionable sort, and at a late hour one night the negro was aroused with some lack of ceremony and ordered to share his quarters with several newly arrived guests. Of course, it was not commendable on his part that after more or less discussion he began to emphasize his refusal of a room-mate with pistol shots, but even better men have been known to be cross when rudely awakened from pleasant dreams. He succeeded in dispersing his unbidden callers, and barricaded his door, whereupon the excluded ones summoned a goodly squad from the police force to "get him out." To make a long story short, they did get him out, burned and riddled with bullets. The significant feature of all newspaper comment upon this incident was that, altho absolutely nothing was known of the negro's previous history, it was generally assumed that he must have been a criminal hiding from justice or he would not have been afraid to let other men into his room. It may have been so—the negro when brought out was much too dead to deny it—but would that assumption have been taken concerning a white gentleman who fancied a room to himself at the St. Charles Hotel, or, in fact, is Southern history entirely lacking in precedents to indicate that he might have adopted the same indiscreet method of defending his privacy?

When, last spring, a peculiarly revolting murder was committed in Shreveport, La., the enraged populace promptly set out, as usual, to "find the nigger." In a few hours they found one, a man with blood stains on his overalls, and who took to the woods when accosted. While the high-minded citizens were even yet exulting in the proud work of having avenged—with the customary rites—the dead woman, evidence was discovered which proved beyond doubt that the murderer, if a negro at all, was not this particular one, who was acquitted of having shed any other recent blood than that of some cattle on a neighboring plantation. Louisiana papers in commenting upon this incident admitted that some regrettable precipitation had marked the occasion, but generally inclined to the view that not much harm had been done, because if the man had not committed this crime, he probably had some other one on his conscience—otherwise he would not have tried to run away! Of course, in view of the methods usually pursued by white mobs, it is entirely reasonable to suppose that a truly virtuous negro, strong in his conscious innocence, would just have stood still and let himself be lynched.

It would be unjust to assert that the better Southern newspapers, like the better people, do not deprecate lynchings, yet they frequently print communications, and quotations from the news sheets of the rougher districts, containing sentiments which they would not dare place upon their editorial pages. And they find a comfort which would be funny, if there could be an amusing side to a national disgrace, in the occurrence of similar acts of violence along the Northern borders of our traditional dividing line. I have no more wish to excuse these outrages in the North than I have to argue against the legal punishment of negro crime. But I have this to say in regard to the popular Southern argument based upon "innate race antipathy": that the perpetual assertion that Northern prejudice against the negro is as strong as that of the South is not true, and that the increasing antagonism of each new generation of white children does not strike me as being "inborn." The apparent indications of the former, of which Southerners make so much, are confined to the ignorant, who have been misled to believe that the black man injures them as wage-earners, and to a certain class of the educated, whose kindly feelings toward the South and honest desire to be "broad-minded" lead them to express a sympathy and tolerance which a better acquaintance with the facts would hardly fail to modify. As to the latter, when every "reduced gentlewoman" who keeps a private school in the South makes it her business to instil into the minds of her little pupils the concentrated bitterness of her forty years of poverty and sad reminiscence, it seems slightly inaccurate to charge the result wholly to

the Creator. Even were this race prejudice innate, that would scarcely prove its right to go unrestrained. Picture the demoralization of our theology if such treatment were applied to Original Sin!

In regard to the educated negro, perhaps the only people really qualified to speak of his actual character are the white men and women who have devoted themselves to his education, and have spent years enough in the work justly to estimate the results. I myself have known negroes in the main as servants, and among them there have not been many college graduates. But I have seen enough of the work of one colored university to feel persuaded that where, as there, it is conducted upon sound principles, the result is more than a surface polish. It should be borne in mind that the negro "universities" are of very various degrees of excellence, and also that it is hard to get fair judgment for the educated negro. The moment the Southern housekeeper knows that she has a "college graduate" (who may, after all, have had barely a high school course) in her kitchen, she is promptly upon the alert for "airs," and she glories in and magnifies every little slip which would pass unnoticed in an unlettered maid. An acquaintance discharged a house-girl whom she found glancing through a copy of Emerson's Essays while dusting.

"I wasn't going to have that kind of nigger around—and she knew more about Emerson than *I* did, too!"

There seems, too, something of inconsistency in the reasoning which, having proclaimed Booker Washington and Bishop Turner "two of the noblest men whom the South has ever produced," declares that the educated negro is an "artificial product" whose "character and disposition education does not change but intensifies."

As I have already said, to my mind it is the prejudice of the white man more than the worthlessness and depravity of the black which has given us a negro question. So long as a part of our population persistently shuts its eyes to what education has done for the negro, and stubbornly refuses to let him live peaceably the life toward which that education naturally inclines him, so long a problem which I believe might, if allowed to do so, work itself out naturally to the good of both races, will not fail to present the difficulties which always beset a solution based upon that worst kind of shortsightedness—injustice.

The Japanese People and Their Naval Victory

BY J. H. DEFOREST, D.D.

MISSIONARY OF THR AMERICAN BOARD

ON the day that is celebrated as the birthday of this Empire—February 11th, the accession to the throne by the first Emperor Jimmu—the news of the victory over the Russian fleet off Port Arthur was confirmed by repeated telegrams and extras. I happened to be in an interior city, where no foreigners reside, and could see the pure Japanese national spirit in free play. I was invited to speak in the theater with one of Japan's ablest orators—Rev. Ebina Danjo, whose subject was "The Warrior Life." This lecture was planned long before hostilities broke out, and was simply one of a series of Christian apologetics that has been held with great success for five years. The managers, however, seeing the city filled with incoming reserves, and a lantern parade planned for the evening, thought the theater would be nearly deserted. To our surprise it was almost filled with ladies and gentlemen, and what was more surprising, the audience was as quiet as a church. Tho I have been in Japan thirty years, and thought I knew Japanese nature, I was for the moment all out in my

reckoning. I expected Mr. Ebina's eloquent allusions to the victory already won, and to the harder battles to come, would excite hearty applause. But there was none. The feeling was deep, yet the self-control was perfect.

This seems to me to express one feature of the national character worthy of study at the present crisis. I find this everywhere. On the following day I was invited to be the guest of a wealthy silk merchant in a village where no foreigner had ever been seen. The schoolhouse was filled in a few minutes with the chief people of the place, who asked me to speak to them on "How Foreigners Regard the War." As I told the reasons why Americans who prize political, religious, educational and commercial freedom could not possibly feel sympathy with a despotic, belated and cruel government, but felt enthusiastically drawn to the nation whose aspirations are at one with ours in the love of international righteousness and in the desire to fight for humanity as well as for open markets, not a particle of applause was heard. This is very unusual with these people, who are quick to greet speakers with hearty clappings. And as I went on to say that their victories brought a new and weighty responsibility upon them to wipe out the shame that rests on the national character, because of two great defects—their lack of commercial integrity and the reputation for impurity that Japan has in all the open ports of the East—there was the same quiet attention, followed with sincere thanks for both the sympathy and the friendly criticism.

Herein is a view of one of the controlling factors in Japanese character. In the last few days I have had occasion to congratulate many people—farmers, teachers, civil and military officials—on the first victory of the war. I cannot do this without showing my own enthusiasm, and naturally I expect to find as much in the Japanese heart as I carry in mine. But every time, without an exception, I am met with a quiet and almost subdued tone, and some look or remark that manifests a profound determination. Said a major, a man of wide linguistic ability, and of experience in the Chinese campaign:

"We are prepared in every direction for every possible contingency. We recognize that we have immense difficulties to overcome. But we are prepared to sacrifice absolutely everything—save our honor. We have been deeply wronged by Russia. We must now meet her. We are ready to die, to sacrifice the future of our wives and children, to see our land reduced to poverty, to lose every material blessing. But we shall fight till we win."

Men thus determined are sober. They do not froth and shout and smile and dance in handshakes. That lantern parade in an inland city, with its illuminated epigrams, lasted but a few minutes, and I have so far seen only a single case of drunken, noisy joy. One great farewell meeting tendered to six hundred army officers was in preparation when a Christian Japanese asked the Governor: "Are you going to have *geisha* to serve the *saké?*" "Not one shall be present. Only our wives and the Red Cross nurse and other ladies shall wait on the officers." This is an immense change in public opinion—one of the rich fruits, I believe, of the long sympathy and friendliness of England and the United States toward Japan. Of course, there will be drunken feasts with *geisha* here and there, but the thought of Christian England as her treaty ally, and the United States as her moral ally, excites without doubt a real and wide desire for that pure home and social life which is one of our most precious treasures, and toward which Japan has made most rapid strides.

The spirit of the Japanese now comes out in the word *kesshi,* "ready even to death." It is perhaps the noblest moral inheritance of the old *Bushido,* the Warrior's Code. No one can mingle with the officers and soldiers without perceiving this spirit. In one of the military clubs an officer was showing me the photographs of the celebrated dead, when he came to one of a colonel, whose official record ends with these words: "Killed in the battle of —— in the Chinese war." My friend said: "He was not killed. He had an acute and exhausting attack of pain a few hours before the battle, and his regiment was consequently late for the decisive blow. When he came up with his troops his friends expressed their deep sorrow for his misfortune, but told him there was but one way left for his own reputation and for his family's future—to go out on the battle field and never come back." The soldier, whose

courage no one could question, went to his fate without a word of dissent, and died on the field by his own hand. This spirit extends far beyond the excitement of a desperate charge or the extreme peril of putting torpedoes under the enemy's ships. The spirit of the army and navy is *kesshi.* That wholly unfair treatment of Russia in forcing Japan out of Port Arthur, on the excuse that it was for the peace of the East, and then coolly taking possession herself, has deepened this determination to sacrifice everything to check the arrogant and dangerous attitude of Russian aggression.

It is not an immoral desire for revenge that is at the bottom of this outbreak. Japan's history is famous for its stories of private revenge, but whoever studies these will see that they are always underlaid with a lofty sense of moral duty and self-sacrifice in a righteous cause. Take away the word *gi,* "righteous," from these stories and they would all drop into nothing but murder. They show exalted heroism, because the righteous element is the impelling motive. So now the moral feeling is profound that this war is for international righteousness. Moreover, the word *humanity* has gained an exalted place in the vocabulary of the ablest writers and speakers, who well know the nameless atrocities of the Russian troops in Manchuria, where women were outraged, then cut in pieces—where children were bayoneted in the arms of their mothers. They know of the recent treatment of Finland and of the Jews. And the heart of Pity, which Buddhism has richly fostered but which knew no way of wide expression until Christian thought quickened it, revolts at what Russia does. So they say, and say truly: "We are fighting for righteousness and for humanity." There will be no slaughters in the wake of an army thus actuated.

If I am correct in the above estimate of the national spirit, as exemplified in the army and navy, it is at once evident that there need be no anxiety as to Japan's conduct after her victories, which will end the war. For Japan will conquer in spite of possible defeats. I have been asked: "In case of victory won't the Japanese have such a swelled head that we can't get along with them?" There doubtless will be swelled individual heads, but these are conspicuous in all Western lands on the slightest occasion, and we cannot well forbid their appearance here. But a nation that is conscious of a new moral life and of consequent great responsibilities, and that also is profoundly grateful to England and America for long years of helpful sympathy, is in no more danger of a swelled head than we ourselves are over this Eastern ally, who now stands shoulder to shoulder with us in behalf of free institutions and a righteous international intercourse. At the recent farewell banquet mentioned above, where we foreigners were treated with exceptional honor, one of the officers said:

"When Commodore Perry came we were utterly ignorant of all diplomatic usages, and were in constant dread of being deceived into some agreement that would stain our national honor. But as we look back we see you were always fair and just. Your great and powerful nation was our true friend, and we shall never forget the debt we owe you."

Any one who knows the national character knows that insolent behavior over victories is foreign to this people.

One more thing that will attract especial attention in this war is the preventive measures adopted to secure not only humanitarian treatment of the enemy but also to guard the soldier's honor. In the war ten years ago everybody will recall the horrible slaughter at Port Arthur and the many charges of brutality and loot and lust against the Japanese soldiers. Why is not all that likely to happen again under similar circumstances? Because, in the Chinese war, there was a call for volunteer coolies to act as carriers, and the worst riffraff of the country flocked into the wake of the army ready for any chance of plunder and lust. Those were the refuse of Japan that made the mud of that campaign. None of them can go with the present army. But the second reserves—soldiers of experience, accustomed to obedience and acquainted with the laws of war—will serve as carriers to the army. This effective measure insures a campaign as free as possible from the too common disgraces of war. Our own American army had men who could apply the "water cure," and one of our true generals, in a fit of nervous illness, gave out the brutal order to shoot every man, woman and child in the enemy's lines.

There must needs be offenses while there is war, but Japan has been as careful by positive and preventive methods to make a clean campaign as our most Christian nations are.

Thus, on the eve of what promises to be an unparalleled sacrifice of life and treasure, Japan is quiet and resolved, believing in the justice of her cause, and believing also that vast responsibility and privilege are on her of doing something for humanity. And her determination is strengthened and her profound gratitude is aroused by the sympathy of the foremost peoples of Western civilization.

SENDAI, JAPAN.

Kuropatkin: Russia's Responsible Man

BY JOSIAH FLYNT

[Mr. Flynt is, of course, known everywhere for his articles and books dealing with tramps, grafters and criminals. Having enjoyed the hospitality of General Kuropatkin, however, for two weeks, a few years ago, he writes the following article about the man at the very top of society and now in the center of the world's eye.—EDITOR.]

IN his stocking feet he stands about five feet and seven inches. He weighs in the neighborhood of one hundred and seventy pounds, and is on the other side of his sixtieth year. He has dark eyes, resembling somewhat the Japanese type, and when he looks at you interestedly you can make no mistake about being "inspected." A fraction of his one hundred and seventy pounds consists of lead; the man has been shot at and hit a number of times; the story is that relics of some of the shots have refused to be dislodged from their resting places. His name is Kuropatkin. Until recently he was Russia's Minister of War. He is now Russia's military hope in the conflict with Japan. He is considered the shrewdest and most capable military expert in the Empire, and he enjoys great popularity among the soldiers. Foreign newspapers have competed with one another in trying to tell when he would leave St. Petersburg for the front. Three weeks ago he was reported to be *en route* to Manchuria, a week ago he was said to be bidding good-by to his mother at Pskov (near St. Petersburg), and today (March 2d) my morning paper declares that he is not to start for the East until the 10th. He may or may not be in St. Petersburg; it is possible that an "understudy" repsents him at his office while he is railroading for Harbin; but that something public will happen when he *officially* reaches the firing line no one who knows the man doubts for a moment.

GENERAL KUROPATKIN

General Kuropatkin is not an easy man to know. There are no insurmountable difficulties to be encountered in order to

shake hands with him; he is also an affable conversationist when ordinary topics are being discussed; but ask him to tell you something about himself or his business when he is not in the mood for such a talk, and your efforts will go for naught. His present duty is to proceed to the firing line, take command of Russia's land forces in the East, and give the Japanese a severe whipping. Admiral Alexieff, until lately commander of the land as well as the naval forces, is to share with Kuropatkin the responsibility of managing the campaign. Perhaps Alexieff will return to European Russia before long. Kuropatkin will probably be left in charge of his command until he is thoroughly beaten or killed.

In 1897 General Kuropatkin was Governor-General of Russian Central Asia, popularly called Trans-Caspia. He lived at Askabad at the time—a place about half-way round the world from South Carolina. When Skobeleff—the man who scared the Turcomans until they are a cowed race—was advancing Russia's frontier line in Trans-Caspia, Kuropatkin was his right-hand assistant. At Geog-tepé, not far from Askabad, 20,000 slaughtered men, women and children testify to the vengeance which the two men wreaked on their Turcoman antagonists. Skobeleff's life ended mysteriously; some say "poison," others "knives;" the fact is that he has gone. Kuropatkin has continued in the cause, and, as said, in 1897 had advanced in rank until he was the local autocrat of the Russian territory bounded by Persia on the west, Afghanistan on the south, Mongolia on the east, and Siberia on the north. I met him at this stage of his career. My task at the time was to see what I could of Russian progress in Central Asia, and to report to American authorities about interesting developments. The General himself was the most interesting fact discovered. The Turcomans were amusing, the Russian veneer over native institutions and customs was instructive, but the man at Askabad took hold of my imagination more than did the Oxus, Bokhara, Samarcand, or the defunct Tamerlane. He lived in a bungalow, called by the English "Government House." The walls of the rooms were decorated with Eastern ornaments, relics of military campaigns, maps and pictures. The General was usually to be found in his "office." He was always dressed in uniform, and his manner was unmistakably military. I saw him two or three times a day for nearly a week, and at each meeting the impression left upon me was the one intended—*i.e.*, "I am the Czar's representative in these parts."

My companions on the trip were Englishmen. One of them was a London correspondent, who has since written a book about Central Asia. He wrote a number of letters to his paper while in Central Asia. Only two ever reached their destination. Perhaps the General saw fit to hold them back; perhaps they simply drifted off the right track. I wrote my letters after I was free of Russian control. This fact is mentioned for the benefit of correspondents who think that censorship in Russia is not to apply to cablegrams during the present war. Kuropatkin will do exactly as he sees fit in regard to this matter, and the Czar is not likely to take a different view. What interested the General in particular at the time of my visit to Askabad was to convince his Western visitors that he was trying to civilize Trans-Caspia as rapidly as was consistent with Russia's "advance" on territory still to be acquired. He made no mention of India; he omitted Western Mongolia and Tibet in his references to Russia's "sphere of influence;" but he let it be definitely understood that the Russian soldier was in Central Asia to stay. None of us found out the strength of the available military, altho the General entertained us with several sham battles (10,000 men were called out on one occasion), and invited us to stroll through his bailiwick at will. Enthusiastic lieutenants and other subordinates, however, did not hesitate to admit that their ambition was to climb over the Afghan hills and do as Peter the Great is supposed to have recommended —make India Russian.

It was considered very extraordinary that so many Anglo-Saxons should be allowed to travel in Trans-Caspia; our party numbered thirty odd men and women. Kuropatkin is said to have been behind the permit given us. The Minister of War wrote to the General more or less thus: "Some English people want to see Russian Central Asia. Do you think it advisable to let them cross the Caspian?" Kuropatkin is supposed

to have replied: "Let the English party come. I will be responsible." Trans-Caspia was, and still is, under military control; special permission is necessary before a foreigner can travel there. The feeling among the correspondents was that the General knew that he had done faithful work, and was glad to have outsiders appreciate the fact. He requested us to give particular attention to the trade schools which he had been instrumental in founding, and ordered our guides—all officers or soldiers—to acquaint us with the commercial possibilities of the district. The under-officials and natives had been advised of our coming weeks before our arrival; even the priests had been told to look forward to the prospective amicable invasion. At Askabad, which was the center of the ceremonies and festivities, the local priest referred to the invasion during an open-air service. The General stood on a rug in front of the priest; *he* remained at "attention" for one hour by the clock, hardly moving a muscle. (The correspondents were not so nerve-less.)

"It is a sign of the times," said the priest during his discourse, "that we have our traditional enemies, the English, in our midst. Civilization has certainly reached a high mark when two nationalities can meet in a friendly way in this land, which was so long a bloody battle-ground. Let us all hope and work for an increase of these amicable relations."

At Government House every effort was made to emphasize the import of the priest's *sermon.* General Kuropatkin entertained us with banquets, excursions into the Steppe district and pleasant hunting, and directed his staff to look out for our comfort when he could not personally be present. In conversation he had very little to say beyond the ordinary exchange of conventional remarks. To the correspondents he gave an official statement, but he put into it very little not found in his published official reports. His main anxiety seemed to be that we should tell the truth about him and his performances when we reached home. Yet, when at rest and not engaged in official conversation, his face made him look as if he was utterly indifferent to what any one said about him or his work. He reminded one of the determined look which characterizes so many of General Grant's photographs. His eyes would brighten a little on hearing the name of some former comrade, but, as a rule, they were set and hard. One of the party asked him about his wounds, when he had got them, and how. He grinned cynically and said: "In war," and passed on. He was willing to be a "parade" soldier when military custom and sham battles called for it, but he evidently hated to be one in the quiet of his home.

I was the only American correspondent in the party, but the General had very little to ask or say about our country. He seemed to be mainly interested in the English, and was careful that they should see at least the external preparations against an attack from India.

Not long after our visit at Askabad the General was called to St. Petersburg, and was eventually made Minister of War. The consensus of opinion among the knowing ones was that an honest man had been given the right job. In Central Asia, while he was still Governor-General, he was also considered a very conscientious official. "He has slaughtered like a butcher," an officer said to me in Samarcand, "but his purse carries no counterfeits or crooked winnings." Honesty in Russia is a relative term, but Kuropatkin shares with Prince Chilkoff, the Minister of Railways, the distinction of being one of the few high officials who are not called grafters.

It has been said that he hates "yellow" people; that, if he gets the chance, he will do with the Japanese as he and Skobeleff did with the Turcomans at Geob Tepé. He did not strike one as being a blood-thirsty warrior. Speaking of the conquest of the Turcomans, he said:

"They had to be taught a severe lesson. They thought that they could play with us. When the opportunity came we took advantage of it, and convinced them once and for all that we intended to rule. It was necessary for their welfare that our supremacy should be established."

When discussing Russian methods of modernizing conquered races he favored as intimate friendly relations as commerce would allow. He explained:

"Here in Trans-Caspia we try as far as possible to assimilate rather than annihilate. In war times slaughter was unavoidable, but to-

day we offer every inducement to the natives to join with us in developing the country. We try to learn their language, and we offer them instruction in ours. Our aim is to make them Russians in spite of their color."

This is what Kuropatkin is going to Manchuria and Korea to accomplish, if he can. There need be no doubt in the public mind in the United States about what Russia intends to do provided she comes out of the present struggle victorious. The man that helped subdue Russian Central Asia and afterward ruled over it has been selected for a similar job in the East. He has for assistants men who have fought with him elsewhere. Tzerfritsky, his chief of staff while he was in Trans-Caspia, is already in Manchuria, and others upon whom Kuropatkin can rely are *en route* for the front.

Sympathy in this country has so far favored the Japanese, at least the public prints give this impression. Russia seems at an enormous advantage, and Japan is looked upon as the "under dog." No one can tell how long the fight will last. Kuropatkin has been through a number of defeats before he has achieved a victory. For a while we may hear of his discomfiture in the East. He is not like Skobeleff, dashing, daring and quick. His strength lies in careful preparation and persistent and plodding attack. If the Minister of Finance provides him with money enough to keep his preparations intact, and the peasantry of Russia furnish him enough soldiers to keep his battle-fields well filled, he will probably give the Japanese the taste of war which they have been looking forward to since their quarrel with China. In any event, he is the important man just now in Russia, and he has shouldered more responsibility than has heretofore been his measure. If he loses in the struggle, and yet retains that impassive and inscrutable countenance which his English guests at Askabad can never forget, he will probably take defeat most decorously. If he wins, there will be a convivial gathering of his generals, he will make a few congratulatory remarks, the national hymn will be sung, the Czar's health will be toasted, and then the commander-in-chief will go quietly to his next task. This is the kind of man he was a few years ago, and there is not much likelihood that he has changed in the time that has intervened.

NEW YORK CITY.

The Art of Song, Yesterday and To-day

BY ADELINA PATTI

[Not the least interesting of the opinions expressed by the Baroness Cederstrom in this interview, which she has revised, are those which bear upon the continuous popularity of the ballad, for it is here that the genius of a people is most clearly in evidence. Her review of the art of song, as she has known it and practiced it for so many years in so many lands, is worthy of the attention of all lovers of music.—EDITOR.]

THE whole scene rises before me now, as clearly as it stood out when I was the little—the very little—child, alternately rigid and quivering with my first stage fright, that anxious dismay which, in all the years that have passed since then, has never once failed to lie in wait for me as I went out upon the stage.

They charged fifty cents for the tickets, small, red cards, which, before the doorkeeper received the last of them, had admitted thousands of music lovers to the old Metropolitan Hall, in New York. How vast, and how distinguished, that first audience—my first audience—seemed to my childish eyes! When I came out to sing, there was not enough of me to be discerned upon the broad stage; so a table, that had been brought from the wings, served for tiny Adelina's pedestal of song. Raised for the moment in spirit, as well as hight, the needful bravery flowed in upon me; and I

sang with all my heart—sang "Casta Diva," from "Norma" until, at the end, the great throng seemed to go mad in its applause. They called out to me; they shouted to me, and the ladies, in their enthusiasm, began to come to the stage to give me the jewels they wore. How they sparkled, and how Adelina, half distracted by the glittering, proffered gems, forsook her pedestal and gathered up her sudden riches, her baby hands at last overflowing with rings and brooches.

I kept them all; and I kept, too, a handful of the small red tickets, which are among the treasures of my home. When, in later concerts, more jewels and trinkets were poured upon me, I scarcely cared for them. I was already wealthy in gems and gold beyond the dreams of a child, or even the needs of a woman.

It was very easy to spoil me. Indeed, what child would not have been spoiled who, with the admiration of multitudes dinning in her ear, believed her voice was inexhaustible, limitless in its power and its range. The Patti of the later years owes all that she became to her father and to her teacher. The most familiar question I hear to-day from women who are interested in my singing, or who have daughters of whose voices they are proud, is: "Madame Patti, how high do you sing?" As if the altitude of the note that could be reached were the be all and end all in the art of music; as if the human voice, which comes from the living throat, were the product of some machine, whose limit need only be the infinite number of vibrations at which sound becomes inaudible to the human ear. I never sing higher than D; throughout this tour, the highest note I have habitually sung is C. Because of my moderation—because of my moderation alone—I have been able to preserve in all its fullness and its roundness the middle register, which is the bone and sinew, the heart and the very soul, of the singer's artistic power. So many wrecks I have seen, so many promises of grandeur unfulfilled, so many realizations of grandeur miserably abandoned. And all because the singers were eager to be misled by the popular cry for something over which it shall wonder instead of those true things of the singer's art, through which it shall feel and thrill and live. Yet it is so natural for her who has the strength inborn to rejoice in its exercise.

As the child, I felt that high C was far below my compass; and I tried my strength, more and more freely, more and more confidently. At length, in one glorious hour, with the chill intoxication upon me of the lofty hights of "Sonnambula," I soared to F, above the high C, for which the music, as written, calls. I was above the clouds in the pride of my achievement. And there my father found me, as he hurried in upon me, his face both anxious and angry, with rebuke within his eyes such as he reserved for the more heinous of my sins.

"Adelina," he exclaimed, with his utmost sternness, "if I hear you sing that note again I will never speak to you."

"Oh, father," I rejoined, wholly unabashed, "that F is very easy for me,"

"Remember," he said, solemnly, "that F, for which you try so hard and make so little of when you have reached it, is the enemy that lies in wait for all the beauty of your voice. Sing F above and your father tells you that you will become mute below."

But Adelina, with the sublime impertinance of childhood, knew more than Adelina's father. She sang F above to her heart's content, until, suddenly, her voice in the middle register was vanishing.

Ah, then, there was catastrophe and gloom. Behold, Adelina in terror most profound—afraid, as for her very life; pitifully wondering whether there could ever be a resurrection; for fifteen long and dreary days a silent thing upon the glad earth's face. Very humble she was, and docile and obedient, when her father, reluctantly relenting, permitted her to sing again among the despised lower notes. The lesson, which was learned then, was learned for all the singer's life.

The fond, firm care of my father was systematically observed by the teacher to whom I owe all the skill that I possess. People have said that Strakosch was my teacher. He never was. He taught me a few operas and a few ballads; that was all. My first teacher, my only teacher, was my half brother, Ettore Barili. It was he who saved my voice. He never forced it; he never permitted me to strain it. And yet he taught me all that could be learned in the Italian

school of singing. To-day, no teacher of the true Italian school lives—except one man. He is Alfredo Barili, the son of Ettore, to whom his father bequeathed all his great wealth of knowledge. He is teaching now in Atlanta, in Georgia; but, if I can induce him to come to London, England and Europe will gain what America must lose, if there is ever to be a renaissance of the perfect Italian art. To-day, he alone can teach it; Patti alone can sing it. But, in those other days, it was the style of Malibran, Grisi, Mario, Bosio, Frezzolini—of all the host of famous singers whose inimitable technique echoes, faintly and sweetly, in the memories of the old.

They were great singers, then—great in spirit as well as in their gifts and in their art. It is pleasant now to think of those living singers who, in their regard of others, perpetuate the fine traditions. No one then who had attained to fame would find a word to say that was not kind and, often, more than generous. Among them all, one of the loveliest natures was that of Jenny Lind. Her whole life through, she was the same sweet, enthusiastic soul. Every year, for very many years, I have sung in Covent Garden; it is one of the delights of my life. Only a little while before she died, while I was singing in opera at Covent Garden, Sir Arthur Sullivan saw Jenny Lind in one of the boxes. He hastened to her, and his first word was:

"So you've come all the way from Malvern to hear Patti to-night?"

"I wouldn't miss her," she answered.

"But," rejoined Sullivan, teasing, "do you not think Nilsson fine?"

"Oh," was her reply, "Nilsson is a wonderful singer. But, for me, there is only one Niagara Falls; and there is only one Patti."

And, a moment later, Sir Arthur was at my side, eager as a boy to tell me of the charming tribute of Jenny Lind.

The singer who preserves and cherishes tenderly the best thoughts and the best impulses is the singer who is most near to the hearts of men and women. Why, if I glance back over my career, it seems to me that, all my life, I have been singing ballads—those songs of the people which, because melody and words have been purely wedded in some deep, strong, enduring sentiment or passion of humanity, remain ever certain to find their way to the depths of the people's soul. My first fame came to me with the singing of "Home, Sweet Home," "Coming Thro' the Rye," "The Last Rose of Summer" and "Within a Mile." I have been faithful to them, as the English speaking world has been faithful. Now, wherever I go the requests that pour in—by letter or by word of mouth—are never for a cavatina; they are always a plea for the old, dear songs, like "Kathleen Mavourneen," "The Last Rose of Summer" and "Home, Sweet Home," which have lingered through the years in the affections until the music, lovely as it is, is beautified with the tender, lambent halo of some beloved past.

They are songs that have remained ever dear to me. Yet, once, I sought to forsake the loveliest among them all—"Home, Sweet Home." My critics of the press told me, and the world, that I was forever singing that hackneyed air. Every concert at which Patti was heard meant the inevitable "Home, Sweet Home;" it seemed they disapproved, and they told the public and the singer that the public disapproved. I made a grand resolve. I would refrain from singing "Home, Sweet Home," and I would give my audiences, in its stead, "Coming Thro' the Rye." Firm in the resolve, I came upon the stage; and I sang, for the last of the encores, "Coming Thro' the Rye" with all the expression it lay within my power to give. And then the tumult! The entire audience, with one acclaim, demanded "Home, Sweet Home." I resisted; I refused; I prepared to depart. But the audience never gave one sign of wavering, or of leaving the hall, until it should hear me sing the song that told of its dearest thing. I had to give way; and never again did I dream of forsaking the most loved of English ballads.

When I began to sing, the ballad was the choice and the right of all the great singers. From Jenny Lind, throughout the profession, there was no one whose supreme test of feeling and expression was not acknowledged to be some of the people's songs. The popularity of the ballad in the United States may have waned for many years, as it has recently grown large again; but in England it has never changed, has never lessened.

The really good English singers are heard, apart from their share in oratorio, only in ballads at the great concerts; and just at present the popular taste for the ballad is more pronounced in England than ever before.

The truth is that the whole world loves those sweet and simple songs, and every nation has some one melody which is as priceless to its heart as the notes are familiar to the ear. When in frozen Russia I used to sing "Le Rossignol," the people fairly went mad. Oh, those Russians! They would rip the Tropic of Capricorn off the earth and fling it to you for a belt. Never have I seen such lovers of music as Russia holds. I sang there for nine long seasons, and I remember very well Governor Curtin, of Pennsylvania, as our Minister. She who was admitted to be the great singer was the guest of honor at the Court. Alexander II, to whom I am indebted for the highest order of merit in Russia, joined with his wife in the most gracious hospitality. When my songs had been sung I must always go to the box occupied by the Czarina, and share with her the tea she brewed in the samovar, which was there for her service. And the people—one marveled how they could find the wealth they were so eager to sacrifice for music. On the occasion of my benefit every season I have stood ankle deep in flowers that were flung upon the stage—hundreds of them—flung, not by the rich, but by the poor, hungry students; and that at a time of the year when a rosebud, tied to a simple fern leaf, cost $1.25 at the florist's.

With the Russians, the love, or, to speak accurately, the passion for music, is not with the rich alone nor with the poor alone. It is in the pulse of the whole people. I remember the generals—General Tolstoy, General Zimmerman, Prince Oldenburg—scores of such distinguished veterans—who made it their custom to await my arrival, after the opera at the time of my benefit, at the Hotel Demouth. Backed by an avenue of flowers on either stide of the staircase, they formed in line, old soldiers on parade, facing the diva with the same stanch front and kindling eye with which they had faced their country's foes. No sooner had I alighted from my carriage, than my guard of honor seized me and raised me aloft, bearing me proudly on their arms up the broad stair of the hotel, those who had missed the glory of the burden crowding close, merely to touch the hem of the singer's skirt. And all the while my husband would stand awaiting me, in mortal terror of some harm, and crying out:

"Don't you break her, gentlemen! Don't break her!"

Apart from the ballads, the music I sang then is, as a rule, the Italian music I sing now. But my heart is given over almost completely to Wagner. Wagner's music is my second religion, as Italian music was my first. Lands and seas are no bar between the beauties of my religion and their faithful devotee. I go to Baireuth, I go to Munich, I go wherever the marvelous cycle is given, whenever it is given. I love it; I love it. And yet I do not sing it; the music of Wagner is too great a strain upon the voice.

I have not lost my affection for Italian music, but in my affections it has lost the first place. I would go any distance to hear Wagner; but whether or not I would go to hear Italian music would depend often upon the quality of its interpretation. One can usually hear Wagner well interpreted, but it is the perfect ensemble which an Italian opera of the first class immutably demands. If one hear an Italian opera now, she may have the opportunity of listening to one good singer, or, perhaps, two. And the Italian opera of the first class demands not only that all shall be good singers, but that all shall comprehend both their relations to the orchestra and their relations to one another. A single weakness makes the crumpled rose leaf, and all charm of enjoyment vanishes from the delicious dream. The world does not hold to-day the singers who can interpret the beauties of Italian opera. But with Wagner individual singers suffice, and if one understand the infinite and varied beauties of the harmonies and the plan whereon the master framed them, the music of Wagner remains a perennial joy.

Neither of the two orders of music has helped the other. I can scarcely believe that any one has learned to appreciate Italian music better than he did by reason of a true understanding of the music

of Wagner. I do not speak of those who merely profess to admire or to understand Wagner—those who feel that it is necessary to declare a liking for something which cognoscenti indorse; poseurs such as they must be beyond the pale of recognition. But even for the genuine, the catholic lover of music, there seems to be a line of demarcation drawn between Wagner music and Italian music which, while it permits him to enjoy both, does not enable him to enhance the enjoyment of one through his comprehension of the other. Another axiom may belong to other arts; but, in music, I find this one applies to others as strictly as it applies to me.

I have been so frank, and have dwelt at such length upon the past and the present, because this may be taken as my farewell—a last farewell to the land where I first sang, where a people were first kind. I am very glad that I have come back, for this last time, to the home my childhood knew. It is a greater land and a larger people, but I find that in few respects it has changed from the land and the people I knew when I sang my earliest songs here.

PHILADELPHIA, PA.

The Discrediting of the Navy Guns

BY PARK BENJAMIN

"Neither do men put new wine into old bottles; else the bottles break."—Matthew IX, 17.

TO say that the Navy is in a state of mind approaching consternation fairly describes the result of Admiral O'Neil's recent order, the effect of which is to reduce the striking power of our Navy guns by amounts ranging between 7 and 24 per cent. The greatest reduction (15 to 24 per cent.) is in the capacities of the older guns, built prior to 1899, which now constitute the majority of all. The situation is extraordinary and appeals to Congress for prompt consideration and relief.

The trouble has been suddenly precipitated by the failure of the "Iowa's" guns. About a year ago one of twelve inches caliber blew off its own muzzle, killing three men. A few weeks since two of the eight-inch guns destroyed themselves, providentially without loss of life, in the same way. There was nothing abnormal in the conditions of firing. The first accident was officially explained by the Chief of the Bureau of Ordnance as "a mystery." The second one has directly occasioned the present order, which is nothing else than an official admission that for the last four years or so we have been imperilling the lives of our seamen, and, what is even worse, risking public safety, by guns too weak to stand the strains imposed upon them.

The "Iowa's" guns, in common with all those designed prior to the adoption of smokeless powder, were constructed to meet pressures of a different and less powerful kind of explosive. Nevertheless, they have been used with the stronger kind, and for that reason apparently have failed. We have been obliged to use the stronger explosive in order to give the projectiles adequate striking power—thus to meet the great improvements in armor—and, latterly, as has been stated, we have designed guns supposedly adapted thereto. But, despite the change in explosives used in them, the old guns themselves have not been changed; so that, even now, instead of rejecting them we retain them, but cut down the powder charges—and that means direct reduction of their efficiency. Furthermore, so great is the official apprehension of further disaster, that even in the newest and best guns, and apparently without cause, for none of them has burst, substantial reduction in their power also has been made.

The effect is to diminish the power of the whole Navy. Warships are not cargo carriers, but gun platforms. They are offensive weapons, effective to the extent that their guns are effective. Reduction in gun power, extending practically

to all the large guns of the Navy, means adding to the thickness of the armor of every possible enemy; means a reduction in naval strength which is serious and to some extent comparable to the loss which the Japanese have inflicted upon the Russian fleet.

If we had been driving our guns up to a power beyond that of the guns of other nations and had now retrograded to the general level, the situation would still be unfortunate, owing to the admitted check to progress. But, on the contrary, it is well known that foreign nations have guns which far exceed ours in power and continue safely to use them. It is also a somewhat significant fact that upon two of the ships of our Navy, which we purchased at the time of the Spanish War, there are high power foreign guns, and that Admiral O'Neil's order does not direct any reduction in their powder charges. And, furthermore, according to figures recently published in the *Army and Navy Journal,* based on comparisons with English, French and German guns, it appears that

"the latest types of United States guns are from 12.5 to 29.5 per cent. less efficient than the average of similar foreign guns, and from 21 to 38 per cent. less efficient than the best similar foreign guns,"

So that we are reducing the efficiency of guns already inferior to those made abroad.

The vital question is, What are we going to do about it? And that is made especially difficult by the existing confusion and doubt which Admiral O'Neil's order creates, and this is still worse confounded by the unexplained reduction in the power of the new guns, since that voluntarily injects doubt where hitherto there has been no public reason to assume it.

Either we have got to be content with the present fighting inferiority of our ships, or else we have got to cure it. To assume contentment is absurd, and, besides, to invite disaster. A heavily armored battleship with weak guns is a heavily armored knight with weak biceps.

At the present time we are putting the cart before the horse, and, as Admiral O'Neil's order shows, we are trying to adapt powder charges to guns instead of guns to powder charges. We want to hit the hardest blow possible. Therefore, we want to use the quantity and kind of explosive which will enable us to do it. If the sort of guns we have will not accommodate that kind of explosive, then we want the sort of guns that will. Hence, if the existing guns, whether new or old, do not meet this condition, they ought to go, no matter at what cost of replacement; and the quicker this fact is recognized the less will be the loss if we happen to be caught in a war before the substitution is made.

Assuming that the guns are to be replaced by others, who is to tell us what others we want and where we are to get them? For the expert advice required naturally we look to the Bureau of Ordnance, and then we discover that that institution has not had a scientific ordnance engineer attached to it since 1899. It then had the best there is in the service, but superior intelligence thought he would be more serviceable as a schoolmaster at Annapolis, and that is where he is now, teaching boys the science of mechanics.

The present Bureau staff is made up of young officers, with neither the age, experience nor abilities to undertake the responsible work of seeing to it that the Navy is properly armed. With the present advent of Admiral Converse as Chief the Bureau will be under the administration of a very competent official, but he is responsible for the disbursement of something like $16,000,000 a year, and it is distinctly not his business to make calculations and design guns.

What the conditions actually are in that Bureau (and hence why the present situation has arisen) is plainly enough shown in the last report of Rear-Admiral O'Neil, wherein he bitterly complains of the system under which it is at present organized. He says:

"It is impossible for the few officers available for ordnance duty to keep pace with and do justice to many important matters which should receive long and careful investigation and consideration, but which from the force of circumstances must now be disposed of offhand for the lack of sufficient help. . . . It is no exaggeration to say that, should one or two officers now on duty in the Bureau be detached without proper reliefs—and proper reliefs are very hard to find—the most important duties of the Bureau would practically come to a standstill. . . . No private establishment

would expect or pretend to maintain efficiency by changing its technical staff every year or two, and yet this is exactly what takes place in the Ordnance Department of the Navy. . . . Such success as the Bureau has had is not due to the present system, but has been achieved in spite of it."

Not merely, therefore, is the inadequacy of the Bureau of Ordnance of the Navy Department as now constituted proved by actual events, but it has been publicly admitted by its own Chief. The reason is not far to seek.

A few years ago the system of assigning duties among the *personnel* of the Navy was established on what might be termed the theory of naval omniscience. We have not yet managed to get rid of it. Under it a naval officer ceased to be a human being and became virtually a number. He was officially assumed to know everything, and hence to be a consummate Jack-of-all-trades, available solely with reference to his numerical status on the Navy list for any service, no matter how narrowly specialized in character. This did not end only in round pegs in square holes. The real effect of this pestilent doctrine has been to discourage personal initiative and to prevent individual devotion to particular branches of the profession and so to preclude the excellence which only comes from concentration of thought and study.

Notwithstanding this obvious blight, a few individuals in the Navy have consistently shown marked talent for ordnance work, but even these we have not fully utilized, thanks to the leveling character of the "system." For example: Besides the expert whom we sent to teach school at Annapolis, another is doing miscellaneous shore duty at Manila; another has been rusticating for years at New Orleans, and has just been relieved by still another ordnance expert of special ability. Another is raking together miscellaneous news in the Bureau of Intelligence. Another, and he an ex-Chief of the Bureau of Ordnance, has been serving as general provider for a lot of lighthouses for the past three years. Another has been shelved as a member of the Retiring Board. Another, probably the best torpedoist we have, is doing hack executive duty in a Navy Yard. Still another, until comparatively lately, was kept in command of the Old Sailors' Home at Philadelphia.

Of course, ordnance engineering is a well recognized specialty, which in civil life demands the exclusive attention of its practitioner. On the other hand, there is nothing in the career of a naval officer as it is now regulated which specially qualifies him in it. The fact is that for years the scientific study of ordnance engineering in the Navy has been grossly neglected. Nobody has been encouraged to follow it, and practically nobody has been permitted especially to follow it.

The Bureau of Ordnance, altho a great gun manufacturing concern, incredible as it may seem, is actually destitute of scientific engineers, and the Navy cannot supply them. Now imagine Krupp or Vickers-Maxim, or any other of the great foreign ordnance builders without such technical advisers, and conceive how long such concerns could exist, or, during their existence, what mistakes would be made. The wonder is, as Admiral O'Neil intimates, not that we are in confusion now, but that in the past we have not landed in far worse confusion, if not absolute disaster.

The reform should begin by the prompt and thorough abolition of whatever now remains of the impersonal Jack-of-all-trades system. Officers having decided inclinations for specialty work should be encouraged and given that work to do, as fully as the general exigencies of the service will permit.

Whether the present policy of Government manufacture of the Navy guns should be continued is one which should be carefully reconsidered. No foreign nation attempts to make all its own naval guns. The question is whether we should not get better guns and besides encourage industrial enterprise if we bought the large majority of them from private makers, always, of course, under such conditions of competition as will prevent combinations to exact excessive prices. The Government gun factory at Washington would then serve as a check upon the manufacturers to the extent of its restricted output.

If, however, gun manufacture by the Navy Department is to continue, then the Navy Department should certainly be rendered able to construct guns of the

highest possible efficiency without turning around and reducing their power within two or three years after their production. Much might be learned by direct Congressional investigation of the whole situation—a course which might well lead to the establishment of a commission selected not alone from naval officers but from the engineers of the country charged with the examination and test of gun metals, gun construction and explosives. From such a commission the most reliable advice could be obtained in order to remedy present shortcomings and to secure for us in the future the best possible guns.

What should be done immediately, however, is to replace the weak guns with the best that it is possible to buy, whether at home or abroad.

NEW YORK CITY.

The Need of a New Copyright Law

BY GEORGE P. BRETT

PRESIDENT OF THE MACMILLAN COMPANY

IT is, perhaps, somewhat late in the day to attempt any defense of the principle of copyright, yet so great has our objection grown to anything that savors of monopoly that when the subject comes up for discussion at any session of Congress opposition develops, particularly in the House of Representatives, to any measure tending to make the rights in literary property more secure and stable, notwithstanding the general recognition throughout the world, among civilized nations, of the right of authors to control their productions, and the fact that without copyright the growth of a national literature is impossible.

There has been in recent years a good deal of agitation in favor of perpetual copyright; a number of articles have appeared in magazines in aid of the project, and a numerously signed petition by authors and their friends was on one occasion forwarded to Congress.

This movement for the extension of the term of copyright seems to me to be a mistake. Indeed, our present duration of copyright (twenty-eight years, with a renewal for fourteen years) seems to me, if anything, too long. Copyright, from the standpoint of the general public and the nation, is useful only as far as it encourages the development of literature by holding out to authors the hope of reward for their labor, and it may well be that the term of copyright might even be shortened without loss to the people as a whole from this standpoint.

It is, at any rate, true that the people as a whole should in the end have the right to all new discoveries and new thoughts and ideas in literature, just as they do eventually have the benefit of new discoveries in the arts, which are equally protected to their originators by patent for a term of years. The scheme of perpetual copyright is, moreover, impracticable from many standpoints.

Our present copyright laws are not only defective and contradictory in many ways, as must always be the case where enactments are made at different sessions of Congress, and in the rush and conflict which attends much of our modern Congressional and State legislation; but they have suffered also from a lack of knowledge of the subject of copyright on the part of legislators, and a want of study of previous measures still on our statutes and the practices and conditions which have grown up under them.

In order to make up for these deficiencies of the present laws a commission should be appointed to make a study of the whole subject of copyright, and to bring before Congress a measure which would do away with the present uncertainties of copyright legislation and give us an act on the subject in line with modern knowledge, and defining, beyond peradventure, the rights of authors and the rights of the public in published works.

While waiting for the appointment of such a copyright commission, and for its

subsequent report, it may be well to point out some of the anomalies of the present laws, which are not only uncertain as to results from the point of view of the copyright owners, but may be likened in actual working to the making of a gift with one hand and the taking of it away with the other.

Those indefatigable workers through whose efforts our International Copyright law of 1891 was enacted—a law of more far-reaching consequences to our national standing and of more value from the standpoint of our national literature than any other legislation of its period—recognized, even at the time, its many deficiencies, but hoped that after its enactment there would grow up a body of decisions on the subject from the courts of law which would define and make clear its many uncertainties—a hope which has not, I regret to say, been fulfilled in the slightest degree.

So uncertain were the rights of foreign authors, other than British, and the rights of translators of their works, that a measure was recently introduced into Congress attempting to define these rights, which in practical working had been found so unsatisfactory that public protest in the matter had been made in various European countries; and the measure so introduced, while in some respects vague and unsatisfactory, would, if passed, accomplish much toward giving justice in copyright to authors of works in foreign languages.

Our failure to secure decisions at law defining the various copyright acts has been caused in part by the increasing costs of law cases, but, above all, by the failure of the law to provide any penalty for the infringement of a copyright, making it necessary for the author to show the amount of his damages—something most difficult of accomplishment in the case of so intangible a thing as copyright property.

The Rev. Dr. Hale calls attention to an amusing case of infringement of copyright in the preface to his new edition of "The Man Without a Country," relating how, in effect, his book was translated, without his consent, into German, and afterward re-translated from German into English, and published in one of the Western States. This book finally came to his notice and was withdrawn from circulation, but only after a number of editions had been sold.

More recently a novel (of which half a million copies or so had been sold), by one of the best known of our young writers of fiction, was published serially in some of the foreign newspapers, which still—alas! for our national solidarity—are so widely read in this country. The owner of these newspapers, when the infringement of copyright was called to his attention, disclaimed (1) a knowledge that the work in question was by an American author, and (2) that the work was copyrighted.

In neither of these cases was it possible to show to the satisfaction of the courts that damages had been sustained by the owners of the copyrights, and the infringers were allowed to go unpunished for serious breaches of the law and invasion of the owners' rights. These cases are, moreover, typical of numerous and flagrant appropriations of copyright which have come to my knowledge in the past few years—a nullity of the law which would be impossible if a minimum penalty for infringement of copyright were provided by law, as it should be.

Another serious defect in the present law is the clause which permits the importation into this country of foreign editions of works having American copyright protection. It is true that the law allows nominally the importation of two copies only "for use and not for sale," a provision innocent enough to all appearances, but still, in practice, resulting in great and increasing injustice to American copyright owners. There being no practicable method by which to determine the rightful or wrongful importation of copies of copyrighted books under this clause of the law, the result is that such importations are now made practically without restriction, and the copies so imported may be found for sale in many book stores in our largest cities, the absence of a penalty for infringement of copyright preventing the unfortunate owner of the copyright from taking any steps to protect his property.

I recollect, on one occasion recently, making a protest to the manager of one of our largest book stores (whose owner, by the by, was one of the leaders in the

fight for International Copyright), against the sale of foreign editions of copyrighted books over his counter, where they were freely displayed. The answer I received was that he knew he was defying the law, but that he proposed, nevertheless, to wait for suit on the part of the copyright owners and judgment against him before abandoning the practice—so little did he respect the law as worded and so sure was he of its inefficacy against infringers of its provisions.

The facilities afforded for the importation of foreign editions of books copyrighted in this country are not rendered less dangerous from the point of view of the copyright owners by the provisions of an older law which permits libraries to import books without payment of the duty which must be paid by all others, which places librarians in a position to avail themselves of the lower prices at which American copyrighted books are usually offered in foreign editions.

I need hardly point out why American books, in common with many other American products, are, for reasons connected with our tariff policy, generally sold at lower prices abroad than to consumers in this country, the general custom in the case of most commodities proving its necessity.

To such proportions has this practice of free importation of foreign editions of copyright books by libraries grown, and so generally are foreign editions of our copyrighted books sold in the large centers of population, through the failure of the law to prohibit such importation or to provide a penalty for the infringement of the provisions of the law as it stands, that it is not inconceivable to believe that cases exist in which American authors have been wholly, or almost wholly, deprived of the benefits of their copyrights, which it is the sole purpose of the law to insure to them.

The fact is that copyright is, and is intended to be, an exclusive right granted to the creator of ideas in literature for his sole use during the term of years provided by the law; and during such term, therefore, importation of foreign editions should be wholly prohibited, or permitted only by arrangement made with the copyright holder, as is the case in Great Britain and other countries in which copyright exists.

I think I may state, without fear of contradiction on the part of any one having knowledge of the matter, that our International Copyright act could not have been passed without the active support of the typographical unions—a support given, perhaps, less as an act of justice to authors than as a means, through the so-called manufacturing classes, of providing employment for an increased number of printers. Whatever may be thought of the abstract justice of this position taken by the typographical unions, the clause itself, I think, promised (until it was found out how easily it could be evaded) to work to the advantage of our national standing and importance in the world of letters, and promised, moreover, to bring about our national supremacy in literature at a much earlier period than would otherwise be the case.

The law, however, was so worded that evasion of this provision of it was comparatively simple to the initiated—at any rate, in the absence of any one having interest in the matter to compel its strict observance; with the result that many books, I am persuaded, on which copyright is now claimed and which are duly registered at Washington are not copyrighted in the legal sense at all, in that their owners have not fully complied with all the provisions of the existing law.

I might, perhaps, go on and state how this evasion of the law comes about, but to do so would lead of necessity to technicalities of no interest to the general public, my aim in this article being merely to point out in a general way some deficiencies in the law as it stands, and to urge its speedy revision and codification as a means of justice to our authors and of use to ourselves in the building up of a national literature and life.

New York City.

Literature

The Masses of London

THE appearance of the seventeenth volume of Mr. Booth's work * marks the completion of the series comprising the results of the most important and exhaustive inquiry regarding the poor of a large city ever undertaken. For seventeen years the investigating has been carried on, and there is hardly a phase of working-class life and its environment that has not been covered.

The present volume, besides furnishing an elaborate abstract of the contents of the preceding volumes, sums up, in a sense, some of their more important data and conclusions, giving in addition the results of later statistics and observations. It is interesting to note that the figures for 1901 indicate a slight betterment in the matter of crowding. Ten years earlier the tenements of less than five rooms housed more than 55 per cent. of the total population of the city. The reduction of this ratio has been but one per cent., but the single room crowding has been sensibly diminished through an increase in the number of two, three and four room tenements. The number, for instance, of persons living four to a room has diminished from 16,111 to 11,279; five to a room, from 7,409 to 4,001, and there have been reductions in each of the other categories running up to twelve or more persons to a room. Nevertheless, the housing problem remains one of the greatest and most difficult of the questions requiring solution. Despite a general improvement, conditions in certain quarters have grown radically worse. The "insufficiency, badness and dearness of the housing accommodation available in many parts of London" is set down by the author as something of which it "would be difficult to exaggerate the facts."

One of the most illuminative tables of the volume is that showing the comparative rank of the metropolitan districts as to poverty, crowding, birth-rate and death-rate. Extremes of poverty and crowding are not necessarily associated. The crowding, for instance, in the Tottenham Court Road district is due in large part to the pressure of numbers of working people desiring to live near their places of employment. Accommodations are insufficient, rents are high and tenants must thus put up with the smallest space. While the crowding in this section is represented by the percentage of 48, poverty stands at 21½. Crowding and poverty are nearly equal in St. Saviors and Waterloo, while in Wandsworth and Putney poverty has more than doubled the percentage of crowding.

A high birth-rate attends crowding in an almost even ratio. Whitechapel and Spitalfields show a slight deviation from the rule; tho ranking sixth in crowding, the birth-rate stands first, with 43.3 per 1,000 of population per annum. But the districts ranking first, second and third in crowding are also second, fourth and third, respectively, in birth-rate and an approximate similarity in these two respects follows in the other districts. What extreme differences the sections of a single city may show in the rate of births is illustrated in the figures for Whitechapel (43.3) and for Brompton (13.5).

The death-rate is also closely related to crowding. It is highest in St. George's in the East (25.4), which stands fourth in crowding, and lowest in Brompton (10.9), which is lowest also in crowding. The death-rate is exceptionally high among the children of the poor. In eleven districts classified as "the poor section," 16.9 per cent. of all born die within the year, while in St. George's in the East the percentage is 20.7, or more than one-fifth.

The drink evil is one of growing importance. It seems to be unquestioned that women are more addicted to drinking than ever before. "Drunkenness among women is on the increase," is the common testimony. The saloon is more frequently visited, and at the same time

* LIFE AND LABOR OF THE PEOPLE IN LONDON. *Vol. 17. Notes on Social Influences and Conclusions. By Charles Booth, Assisted by Jesse Argyle, Ernest Aves, Geo. E. Arkell, Arthur L. Baxter, and George H. Duckworth.* New York: The Macmillan Company. $2.00 per volume.

the "growler" is more generally used. Tho it is only among women who have reached or passed middle age that drunkenness is common, moderate drinking is becoming more general among girls. Among men drunkenness is less common. There are several causes for this—the necessity of greater sobriety in the skilled trades, the fact that the workers' tipple is usually a weak beer, and the yet more important fact that it has come to be considered unmannerly, if not unmanly, to be drunk. The total amount consumed is probably as great as, if not greater than, ever before; but a distinct betterment is observed as to the effects, at least in so far as men are concerned.

Among the lower classes of the poor immorality is not uncommon, tho whether it is diminishing or increasing cannot be said. "On the whole, it may be accepted as a correct opinion," says the author, "that 'immoral relations before marriage among the lower classes are not unusual, and are indulgently regarded. Girls of this class do not lose caste because of an illegitimate child.'" And he continues, "Usually marriage, 'when needed,' is expected to follow, and does follow closely on the indiscretions of the young." Among older people, widows, widowers and those living apart from their spouses, irregular relationships are formed "without benefit of clergy," and are often maintained for years, if not till death. "The difficulty (said one of the clergy) is that those people manage to live together fairly peaceably so long as they are not married, but if they marry it always seems to lead to blows and rows. They do not trust each other sufficiently to marry."

The author briefly touches upon some of the many projects whose aim is the amelioration of conditions. His own design, he writes, was not to teach, but to describe—to observe and chronicle the actual, leaving remedies to others. But in the course of his work he was led into offering suggestions as to how advances might be made. Some of these are reiterated in his conclusion. "Improvement must be sought, first of all," he writes, "in the deepening of the sentiment of Individual Responsibility." But as to how this estimable sentiment is to be developed we are left in vague doubts. A pauperized, brutalized and drink-besotted section of the population, such as that of which he writes, would seem to be almost hopeless material for such culture. Indeed, he has himself told us how these people scatter, like leaves before the blast, at the first suggestion of moral exhortation. More practical suggestions he makes, it is true, but the evidence that he has abiding faith in the potency of any plan to abolish present evils is not clear. That there has been improvement, as shown in the trifling differences in the percentage of evils between two decades, he maintains; that there is still to be improvement is his hope and expectation. But that this improvement is to be at all commensurate with what Justice and Humanity demand, appears nowhere in the book as either expectation or hope. The reader who lays down this monumental work of careful and conscientious inquiry and collection must inevitably conclude that its author finishes his task with a conviction of the powerlessness of human agencies to apply a remedy to these gigantic evils. The failure to point out a sufficient remedy is the glaring defect in a work otherwise beyond praise.

Violett

THIS novel* should have been published anonymously. In that case it would have been recognized as out of the common run, for both its felicities and defects are remarkable, but as coming from the author of "Our Lady of the Beeches"—a novel of really superior excellence—it is such a distinct disappointment that one can hardly do it justice. It is a novel of pseudochromesthesia. Not that the author uses such technical terms, but the peculiar power of "Violett" for hearing and feeling in colors is brought in so mechanically and obtrusively as to lose its poetic and suggestive value. This peculiar mixing of sensations, which is something like the crossing of telephone wires, has been very effectively and delicately used, as well as most absurdly abused, by several story-writers and poets, especially in France and Belgium, but in this novel it acts as a guide to the hero very much as the magic music did in the finding

* VIOLETT. *By Baroness von Hutten.* Boston: Houghton, Mifflin & Co. $1.50.

game of our childhood. Just as in Du Maurier's "Martian"—a very similar disappointment, by the way—"Barty" lost the sense of north, so "Violett" loses his chromatic perceptions and all things become grey whenever he violates his ethical or esthetical ideal.

It is to him a sort of conscience and keeps him true to the conventional morality of romances, which is a difficult thing to do, because this peculiar system of ethics is not founded on either philosophy or common sense. But "Violett" is a genius, and a genius can do anything—except act like other people. He is as ignorant and as innocent as Parsifal, and, like Parsifal, he makes a great deal of trouble for other people by not asking questions. He has a marvelous appreciation of the technique of English poetry, but does not know the meaning of some of the commonest words. He can take the star *rôle* in a historical drama without any previous training; but, then again, he does not know enough to go in when it rains or to feed himself when he is hungry. He is a wonderful musician and swimmer, but both these gifts fail him when they are most needed.

It may be said that these things are no more incredible than those which form the substance of some of our greatest novels, and that is true, but in this case the impossible is not made plausible, nor the improbable convincing.

The boy of the lighthouse, grown under the shadow of a great crime; his plunge into the artificialities of theatrical people in London; the vivid descriptions of both sea and town; the playmates created by the fancy of the lonely boy; the very lifelike and well-drawn character of Sonnenthal—all this is material of the best quality, but it is largely spoiled by the crudeness and carelessness with which the book is put together. If the author had worked over it for some fifteen years, as Watts-Dunton did over "Aylwin," it would have been a great book. The author should have pursued her investigations in experimental psychology a little further and she would not have said that a grey object on a crimson background looks red. It would be well also to hire an expert librarian to keep track of the little box of books left by "Violett's" mother, to prevent the change of "Oliver Twist" into Byron.

Professor Briggs's New Book

Professor Briggs's learning and industry are unquestionable. In the present little volume * he avowedly directs them to the solution of the problems of harmonization of the Gospels, professing to "apply the same rigorous methods of criticism to the New Testament that I had applied for many years to the Old Testament."

The author's conviction is that he has found "new light" in respect to the period before the Baptist's imprisonment and the visits to Jerusalem reported in the Fourth Gospel, old stumbling blocks of the harmonists. "Criticism" he seems to take as meaning freedom to reject, alter or accept the statements of his sources in accordance solely with his own harmonistic idea, without comparison or critical valuation. On this plan the difficulties, of course, are easily overcome. In reality the typical "harmonist" is from the very nature of his assumptions uncritical, and it is this temper which controls the present attempt. A few illustrations will suffice.

On p. 3 it is said to be implied by Luke's omission of "after John was delivered up" (Mark 1:14) that "Luke did not think the ministry of Jesus in Galilee began after the arrest of the Baptist." On the next two pages (4 and 5) this becomes repeatedly "Luke's statement." But the only reply to the obvious explanation, "Having related the arrest of John in 3:19, Luke saw no reason to refer to it again in 4:14" is that this topical order "destroys the historical importance" of the clause. This may be true; but we have no right to infer more than that Luke saw in Mark 1:14 no such causal relation as is assumed by Matthew (Matt. 4:12). Professor Briggs's inferences ignore Acts 1:22 and 10:37, and leave wholly out of consideration the admitted apologetic interest of later times, so marked in the Fourth Gospel, to refute the representation that Jesus "came after" the Baptist and was therefore inferior.

On p. 109 we read "there was an eclipse of the sun (!) and an earthquake. . . . The veil of the temple was rent

* New Light on the Life of Jesus. *By Charles A. Briggs, D.D., Professor of Biblical Theology, Union Theological Seminary.* New York: Charles Scribner's Sons, 1904. Pp. xii, 196. $1.20.

by the earthquake." On p. 172 "there is no good reason to doubt the earliest traditions that Mary retained her perpetual virginity." On p. 186 "Probably here the incident of the finding of a shekel in a fish occurred." To establish the sequence of occurrences in the "forty days" after the resurrection it suffices to count the number of reported appearances and distribute them between Jerusalem and Galilee, without any regard to the conflicting streams of tradition. Mark 16:9-20, though acknowledged to be spurious, is regarded as derived indirectly from the same author, though this gospel supports the Galilean form, the Appendix the Jerusalem form, the two excluding one another. It is sufficient reason for the statement (p. 118) "They saw Jesus ascend into heaven on the sixth Lord's day after his resurrection," that "it is altogether probable that Jesus would choose a Lord's day for his ascension." On p. 59, "It is quite possible that the casting of the traders out of the temple on the tenth day was due to an attempt to defraud his disciples in the purchase of the Paschal lamb." On p. 103 this trivial fancy is again "possibly" the occasion of Jesus' "assertion of his Messianic authority;" on p. 188, "probably."

To regard this work as "rigorous criticism" would be to turn the science into a laughing-stock. Yet we have not to do with dogmatic ignorance, but with the work of a real and in some respects a great scholar. The explanation is all contained in the candid avowal that "harmonization" is the object. The word "criticism" seems to be used in a Pickwickian sense. This explains why the writer finds no problem in the variation of the Johannine from the Synoptic account of the Baptismal Vision. *Both* are true:

> "The theophany of the heavenly Voice and the Dove convinced the Baptist that Jesus was the Messiah: and gave Jesus Himself the consecration to His ministry."

With many of the author's ideas we find ourselves in sympathy, in particular with his belief in the need for critical analysis and painstaking research into the history and structure of all the Gospels, the Fourth not excepted. But "new light," even if present (and we cordially admit the title to be in some respects deserved) will hardly commend itself to a sane and sober-minded public when controlled by the harmonistic purpose.

The History of Mexico

Mr. Noll's volumes* give a comprehensive survey of the long course of events from pre-Columbian to present times by which our Southern neighbor has, after many broils and vicissitudes, worked its own way upward to a comparatively high place among the nations of the earth. In the pages dealing with the primitive Mexican tribes Mr. Noll, it can be demurred, is rather dogmatic. French authors and some American investigators hold that the ancient Mexican civilizations were simply the outgrowth of mound-builders who emigrated from what is now the United States southward. Prof. Edward Seler, one of the most eminent archeologists, advances the opposite theory that the Toltec, Aztec and Maya cultures originated in the regions where they are found in Mexico. Man is very old in America, and it is highly probable that the year 720, which has been ascribed as the starting time of the Toltecs in Mexico and which Mr. Noll dismisses as "a suspiciously early date," is not so remote a date after all. If, as good authorities contend, the cultures of those ancient tribes were neither borrowed nor imported from any other people, but were spontaneous and original, then their development must have been the slow process of many, many centuries. Aboriginal tribes do not suddenly leap from rude huts to the erection of sculptured stone edifices nor from savagery to a comparatively high practice of constructive and decorative arts in one, two or three centuries.

With that part of Mexico's history beginning with the Conquest there is more reason to expect approximately careful statements. The account of the Conquest is succinctly given, but there are certain discrepancies which are open to revision. Mr. Noll doubts the existence of sixty thousand families or even sixty thousand

souls in Tenochtitlan and Tlateloco (practically composing what later became the City of Mexico) at the time of the Conquest. Yet he tells that in May, 1520, there was a general slaughter of the natives at a feast, and when the Indians arose to resent this in armed conflict great loss was inflicted upon them. In July, 1520, when Cortes were forced to make a sortie out of the city, the losses of the Aztecs, says Mr. Noll, were beyond computation. Smallpox, introduced into Mexico by a negro in the army of Marvaez, carried off thousands of the natives. Subsequently Cortes besieged Tenochtitlan, and the daily losses of its defenders are again stated to have been beyond computation. "It is hazarded as a guess that 100,000 of the Aztecs had died either in battle or of hunger during the siege." This estimate seems to make no allowance for the numbers dying of disease during the horrors of the long siege of 1521, when the streets were littered with festering corpses. Mr. Noll states that at times the people of Tenochtitlan were reinforced by warriors from neighboring pueblos, but even with the most generous outside assistance, the resident fighting population must have been very large.

Conquered by the Spaniards because of their own internal dissensions, the Indians at no time lost their love of independence. During the long rule of the sixty-four Spanish viceroys, from 1535 to 1821, their spirit was dormant, not suppressed, and the centuries of official and ecclesiastical extortion, oppression and discrimination to which they were subjected only the more inflamed them with an enduring sense of wrong. When Hidalgo, a Creole priest, first raised the standard of revolt in 1810 his army was largely composed of Indians, and in every later uprising the Indians came instantly forward. From the independence of Mexico in 1821 to the advent of Maximilian one revolution followed fast upon another; but it was to the courage, the patience and the sagacity of a pure-blood Indian, Benito Juarez, that the movement which overthrew Maximilian and established the republic on a firm basis was greatly due. And it is due to another great Mexican, partly of Indian blood, Porfirio Diaz, that the Republic of Mexico has been raised to a point of order and progress which, in some respects, exceed those of any other country in the world. For comprehensive treatment of the history of Mexico Mr. Noll's volumes are entitled to first place in the literature dealing with that country, and we hope that he will supplement these with a work that could not fail to be of absorbing interest—a detailed account of the social and economic progress of the Mexican people.

Mycenæan Troy. By Herbert Cushing Tolman, Ph.D., D.D. and Gilbert Campbell Scoggin, M.A. American Book Company, 1903.

This book of somewhat less than seventy-three pages of printed matter, apart from the preface, table of contents and list of illustrations, is an attempt to present in condensed and somewhat popular form the results of Professor Dörpfeld's definitive excavations at Troy, published by him in a large book. Laymen and even scholars will be thankful for this concise presentation. Schliemann's name is inseparably connected with Troy. But the work of Dörpfeld, carried on both in association with Schliemann and after his death, is what gave to the world the real Troy. At Dörpfeld's first appearance on the scenes along with Schliemann it was said, "Then there was light also among the walls of Priam's citadel." There was much need of this, for to the casual visitor of the hill of Hissarlik, now known as Troy, nothing is more confusing than the apparent hodgepodge of walls that cover the slopes of the hill and appear inside it. Dörpfeld has become the expositor *par excellence* of these walls. Schliemann had supposed until his death that the Troy of Homer was the small and insignificant city, the second on the spot, and several times burned. But it now appears that the sixth city from the bottom, a stately acropolis, with a wall as impressive as those of Tiryns and Mycenæ, was the one known to Homer, and is a Troy which the world can accept as such. This is what the present publication undertakes to present, and the task has been fairly and successfully performed. To the ordinary reader there will doubtless still be a penumbra of difficulty, inasmuch as such a complexus of walls can only be

perfectly understood by going around them and over them, preferably in the company of Dörpfeld, whose custom it is to expound these walls annually to persons particularly interested in them. But the editors of this book have endeavored to perform in a way this function for those not so fortunate as to enjoy that privilege. The numerous illustrations intended to assist to this end are, unfortunately, in many cases inadequately reproduced. To the description are appended two short chapters, "The Mycenæan Civilization" and "The Mycenæan Age and the Homeric Poems," both regrettably brief, but made so in keeping with the scope of the book. An occasional inaccuracy occurs; for instance, when Sparta is spoken of as nine miles from Athens, whereas it is eleven miles distant by the shortest road, and Menidhi (*i.e.*, the beehive tomb, of course) as seven miles distant, when it is really only five.

The Web. By Frederick Trevor Hill. New York: Doubleday, Page & Co., $1.50.

The most vital scenes in this story are laid in the Manhattan County Court House, its principal protagonist being a brilliant young lawyer upon whose skill and resolution hang the destinies of more than one celebrated case. His rescue of two of his clients from the web of "shifts, evasions, trickery, political 'pull' and absolute dishonesty which sometimes complicate modern legal procedure" constitute the substance of this genuinely absorbing narrative; but there is a thread of pretty romance interwoven with the sterner stuff which is as delicate as it is refreshing. Altogether the book is one of notable excellence and makes good its publishers' claim for it to the effect that Mr. Hill has woven into his striking study of the law and of human character a most absorbing story which challenges comparison with the best novels in construction, finish and sustained interest.

To-day in Syria and Palestine. By William Eleroy Curtis. New York: Fleming H. Revell Co., $2.00.

The letters of Mr. Curtis from foreign countries are so prominent a feature of several of our daily papers that it is not necessary to do more than call attention to this collection. Written as they are at the rate of twenty-five hundred words a day, sometimes under the most inconvenient surroundings, they are neither profound nor accurate, nor have they any literary charm; but they are always readable and contain information as to present conditions not easily found elsewhere.

Pebbles

A WORD to the wise is superfluous.—*Yale Record.*

....*Foreigner:* "Where sall I learn ze American vays?" *Facetious Acquaintance:* "Try the Customs House."—*Princeton Tiger.*

....The importunate lover had just proposed. "Let your answer be a vowel with a consonant on either side of it," he gently begged her. The charming girl smiled. "Very well," she said. "Git!"—*Cleveland Plain Dealer.*

....With Vienna 20 miles away the Emperor ordered the army to encamp for the night in a driving rain. "But the tents leak," objected the Adjutant. "Pitch them," commanded Napoleon sternly.—*Yale Record.*

Under her splendid, costly veil
The happy heiress stands;
The girl, a gorgeous sight is she,
With gems upon her hands:
Beneath a dozen strings of pearls
Her virgin breast expands.

Her gown cost twenty thousand plunks,
The gems caught in her hair
Are worth a hundred thousand more,
The shoes she has to wear
Gleam with ten thousand dollars' worth
Of jewels fastened there.

From head to feet she's studded with
The richest gems that glow,
No wonder that with honest pride
The groom beholds her so—
She's worth a dozen times her weight
In yellow gold, you know.

The organ peals triumphantly,
The wondrous thing is done;
The fight was hard for Cupid, but
The citadel is won—
The lady has the title, and
The nobleman the "mon."

Thanks, thanks to thee, oh happy bride,
For the lesson thou hast taught;
Thus love, divine and sacred still,
A miracle has wrought,
And thus low-down vulgarity
Receives another swat!

—*Chicago Record-Herald.*

Editorials

The Recent Postal Report

A MAJORITY of the members of Congress whose names appear in the recent supplemental report from the Post Office Department are now suffering from unjust criticism. The origin of this report, or statement, may be found in the first Bristow report, which said that "long-time leases for post office premises were canceled and the rent increased upon the recommendation of influential Representatives;" that "if a member of Congress requested an increase in the clerk hire allowed to a postmaster, Beavers generally complied, regardless of the merits of the case," and that Beavers "made contracts with members of Congress for the rental of premises," either in their own names or in the names of their agents. Proof in support of these assertions was demanded by the Democrats, who were asking for a comprehensive investigation of the Department. Proof of the first of them had already been given in the official record of the transactions in Chautauqua County, New York, to which we referred some time ago. But those instances were of an exceptional character. The committee called, and called repeatedly, upon the Department for the complete record. After some delay it was forwarded to the committee, a document of 218 pages, and the committee laid it before the House. The result was that the just suffered with the unjust.

The statement had been prepared hastily; the instances cited in it had not been subjected to such classification and explanatory comment as justice required; the evidence in certain cases was incomplete. We do not say that any part of it ought to have been withheld. But existing official papers exonerating members who appear to be accused by it of wrongdoing should not have been omitted, and the explanations showing that there was nothing dishonest or censurable in a large majority of these transactions should have accompanied the record. The committee could not edit the statement; it could not make the needed classification; it could only make adequate explanation and comment in an accompanying report of its own, and this, for some reason, it failed to do.

Our review of the substance of the statement must be brief. The three instances of the leasing of property owned by members present no indication of fraud or wrong. Leases were first made before the owners entered Congress; renewals while they were members were in technical violation of the statute; but it now appears that in two instances, at least, the owners sought to obey the law and can produce the official reports or opinions by which the Department satisfied them that existing conditions might properly be continued. Of course, these papers should have been included in the report. The rents were small and reasonable. So far as we know, it is not asserted by any one that there was any dishonesty, any "graft," in these transactions. It would be absurd to assert it. These cases should not be classed with those others in Chautauqua County, where men were fraudulently carried on the post office pay roll for years and the leasing of post office rooms had some curious features. We cannot find any evidence of dishonesty in the report's 177 instances of recommendation from members concerning leases, or, we should say, in those selected examples that have been given to the press. Bearing in mind the work which a member is expected to do at Washington for his constituents, we find nothing discreditable to Mr. Hill in his letters and efforts with respect to the renting and equipment of rooms for the post office in Norwalk, altho it is pointed out that he held one-twenty-ninth of the stock of a club that owned property including these rooms, for which the Government pays $900 per annum. Even the $100 additional rent for which Mr. Bates asked appears to have been deserved by the town that owned the property in question. But he should not have sought thus to use the Department to promote his renomination.

Of the 161 instances of asking for and obtaining additional allowances for clerk hire, nearly all involve very small sums, to a considerable part of which, at least, the postmasters were fairly entitled, as the subsequent official estimates showed. We suppose that in some of these cases the member was asked to interpose in order that the delay of much red tape might be prevented. In other cases members may have been deceived by postmasters. It is possible that in a few of these instances the money (commonly not exceeding $300 or $400) was wrongfully diverted to persons who ought not to have received it, but there is no proof of this. The list includes Mr. Bristow himself, who asked that an allowance of $180 should be given to the postmaster at Erie, Kan. An official inquiry at a later date showed that the man was entitled to only $50.

It is difficult to generalize justly concerning all the instances in the report. In a few of them there may have been slight traces of moral turpitude; but the statement as a whole warrants neither the severe public criticism that has pointed to it as proof of corruption nor the extraordinary denunciation of the Department's officers by members of the House during the debate of last week. We have noticed in one of our contemporaries the remark that no one of these complaining members will suffer by reason of the report if he really has done no wrong. But it is true that some of them are angry, because, altho innocent, they foresee clearly their own suffering and loss. It is to be expected, we think, that several members will be deprived of renomination or re-election on account of this report, altho it shows them to have been guilty of nothing more objectionable than an attempt to improve the service at their local post offices. What they have done has now been associated by this report with the frauds exposed by the Bristow investigation, and their names have been associated with those of the rascals whom the Government is prosecuting. Some of them, whose course has not been entirely clean, may suffer justly; the innocent will suffer with them. After a Representative has been pilloried by thoughtless or biased newspapers, and denounced in their startling headlines, it is difficult in a case of this kind for him so to defend himself in his district and so to explain that he shall lose nothing there. And it should not be forgotten that all these transactions were with officers, since indicted or convicted, whose power and whose escape from punishment in the past have been accounted for in public reports by the explanation that they had won the support of Congressmen by granting their requests for favors that should have been withheld.

Those who suffer by unjust accusation may fairly hold the Department responsible for their losses. The dealings of a Congressman with an executive Department should always be of a character that can bear the light of publicity, but he has a right to ask that they shall be published fairly and reasonably, if published at all. In this case some one in the Post Office Department has blundered, not in sending the record to the committee, but in presenting it in an incomplete form and without such classification and fair explanation as a scrupulous regard for justice demanded. Mr. Bristow has been ill for several weeks, and he does not appear to be responsible for the error. Responsibility must rest upon the Postmaster-General, who should have been induced some time ago to seek the retirement of private life.

The Fundamental Issues

WHATEVER the apparent or nominal issues of a political campaign may be, there are always two real issues at the bottom. It is these that men differ over, and sometimes fight over, whatever the shibboleths with which they try to fool one another, or succeed in fooling themselves. In what relation shall the nation stand toward the great world of mankind beyond its own borders? That is one issue, as old as political institutions, and as new as the youngest republic in the family of States. What kind of a government shall the nation have within the sphere of its own internal affairs? That is the other question, sometimes becoming the question of constitutional forms, as monarchical or republican; sometimes becoming the question of constitutional limitations, defining governmental powers; more often becoming the question of policy—of what specific things

the Government here and now shall undertake to do.

It is only at infrequent intervals, however, that both of these fundamental questions take on an exceptional importance at the same time, in any one political campaign. Under the administrations of Washington, of Jefferson, and of Madison in our own history foreign and domestic affairs were nicely balanced public interests, primarily because in the creation of a new body politic it was necessary to establish precedents within each sphere of activity. Under the administration of President Monroe a foreign policy was promulgated which has been a distinctive feature of the American political program from that day on. During the Civil War there were days when it became necessary to withdraw attention in a measure from the domestic struggle and to turn it upon the delicate task of maintaining, without show of force, a respected and independent place among the nations. With these exceptions our politics has been concerned chiefly with domestic interests.

Four years ago our relations to the world at large suddenly became the paramount issue. The Spanish War and its consequences, the extension of our sovereignty to insular possessions and to the Eastern Hemisphere, and our relations to the disintegrating Empire of China for a time put all domestic questions into the background. Yet, even then, the nominal issue and one of the real issues fought out in the Bryan-McKinley contest was that of the integrity and stability of our monetary system, while deep down in the hearts of hundreds of thousands of voters who cast their ballots for Mr. Bryan was the conviction that in fact they were fighting for economic liberty against powerful corporate interests.

The campaign which is now beginning in the preliminary skirmishing of possible candidates for the Presidential office will be a memorable one in the frankness with which both of the fundamental issues will be recognized. Mr. Roosevelt stands unequivocally for a policy of positive influence in world affairs. He has unhesitatingly committed his administration to a reconstitution of political lines on the Isthmus of Panama and to the building of a waterway uniting the oceans as an American enterprise. His Secretary of State has approved himself the most far-seeing and positive personal force that America has until now thrown into the balance of world politics. At the same time Mr. Roosevelt stands for the supremacy of the state over corporate interests as unflinchingly as William of Normandy and Henry II stood for the supremacy of the English state over the ecclesiastical interests that threatened to subvert the civil power. Any Democratic candidate must take the same position if he would secure a large proportion of the possible Democratic vote. The one hope of the corporate interests to prevent a further legal restriction of their privileges lay in a possible defeat of Mr. Roosevelt in the Republican convention. It is frankly admitted that the hope vanished with the death of Mr. Hanna. It is no secret that the chief personalities in Wall Street have since Mr. Hanna's death made pilgrimages to the White House to ascertain how far they may expect to obtain some recognition of what they are pleased to call the rights of corporate property from the man who, as they now believe, will in all probability occupy the Presidential office for another four years.

There is great encouragement for all patriotic Americans in the situation that is thus taking shape. There will be no going back from the position which this nation has taken as a positive, a progressive, but always conservative and humane power, among the peoples of the earth; and this progress happily will probably not be made at the cost of such indifference to the economic and personal liberties of the American people themselves as usually attends an expansion of national influence through military operations. As things look now we are justified in believing that the entire people is thoroughly awake to the importance of asserting and establishing the principle of the supremacy of public over private interests in the economic organization of society, step by step with the growth of American commercial supremacy and of American influence in the world at large. We look to see a progressive socialization of the vast capitalistic basis of our material prosperity. We are entering upon a campaign that will carry us another stage in the evolution of a society

wherein freedom and opportunity of the individual shall ultimately be established, while the Government that protects him at home is strong to represent him as a potent factor in the civilization of the world.

What Are Sheriffs For?

Two notable attempts have been made the past week violently to interfere with the execution of law, one in Springfield, O., the other in Murphysboro, Ill. In one case the attempt succeeded, in the other it failed. What is the reason that it succeeded in one case and failed in the other? It was simply a matter of sheriff. At Springfield the sheriff would not resist the mob because he was afraid there might be "loss of life;" at Murphysboro the sheriff called in one deputy, and the two men put their guns out of the window and threatened to shoot any one who attacked the jail. Then the mob melted away.

What are sheriffs for? Their business is to preserve the peace. They are the officers, the representatives, of the might of the law; they have to arrest offenders against law, and to hold prisoners in safe keeping before and after trial. It is the sheriff's business to protect his prisoner and his jail against violence. This is not because he favors his prisoners, but because he is the guardian and defender of the law. He has been appointed for this very purpose, because he is supposed to be a man of courage. A coward has no business to be a sheriff. A man who has no reverence for law has no business to be a sheriff. It was the business of the sheriff in Springfield to support the law against that audacious and lawless mob. He should have killed ten men, or fifty men, or a hundred men, before he allowed law to be thus outraged. He could have done his duty well enough, but he was either too much of a coward or too much in sympathy with the mob to do it. It would have been less a dishonor to the State of Ohio to have had a hundred of her lawless and criminal citizens shot than to have had this shameful deed occur.

Think what it was. A man charged with a very serious crime, not yet tried and condemned, had been taken by the authority of the State of Ohio, and was held in a State building, under the State protection. The mob that attacked that building assaulted the State of Ohio. They were rebels against its law. They took by violence this man out from under the protection of the State and murdered him. Then, with their fury still unglutted, they proceeded from murder to the crime of arson, setting the residences of citizens on fire. Meanwhile the sheriff let them have their way, until the Governor of the State sent troops to restore peace.

And this was an Ohio sheriff; it was an Ohio mob. It occurred in Springfield, in the center of the State, only a few miles west of Columbus, the capital. It was not on the southern edge of Ohio, near the Kentucky border, but in the very heart of the State. It was not in Mississippi or Louisiana, but in the State that gives us Presidents, and in the town that was the residence of the late Governor of Ohio. That sheriff's pusillanimity has made the name of Ohio a by-word through half the Union, where his act and that of the mob which he allowed to do the work will be declared to represent the will of the people of the State he and they have shamed. No one can say how much he has done to reverse and destroy the credit and honor with which McKinley and Garfield and Hayes had crowned the great State of Ohio.

We have one bit of advice to give in the matter. Let not Governor Vardaman, of Mississippi, on any right or pretext of courtesy be invited to visit Ohio. We can imagine what he would say. He would recall how he rushed a private train to stop a threatened outbreak, and put the prisoner in his own car and took him to a place of safety. And he repeated a few days later his vigorous protection in another case. He wants law, and nothing but law, in Mississippi. He would teach Ohio a needed lesson in the administration of law. Poor Ohio, that must go to Mississippi for instruction and example!

The poor we have always with us; yes, and the vicious and lawless also. All our States have them—some more of them, some fewer; but whether they shall submit to law or shall override law is a simple matter of sheriff. The Lord give us sheriffs that can shoot!

Where Marriage Is a Misdemeanor.

"MATRIMONY is an honorable estate" —except in New York. "Commended among all men"—except school boards. The Prayer Book to be up to date must be revised in some such way as this. The efforts of the school authorities in Greater New York to stamp out matrimony among teachers are not altogether successful. The Court of Appeals has declared invalid the by-law forcing the resignation of any teacher —that is, any woman teacher—who marries, and it has been discovered that it was not well enforced even when supposed to be legal. One teacher in Astoria was found guilty of having been married last vacation, and further detective work led to the disclosure of another scandal in the same school: one of the most reputable teachers was proved to have been living in a state of matrimony for the last three years without discovery by the school authorities. Of course, both women were discharged at once, but since it has been found impossible to replace the latter of these two teachers, even at her salary of $1,040, she will be continuously hired to teach the same room as a substitute. We would, however, warn the School Board that compounding a felony makes one liable to its penalty, and by this evasion of their own law they are virtually compounding a marriage.

While the school boards in many parts of our country are forcing out the married teachers, the French Government is trying to get a law passed prohibiting from teaching any one who has taken vows of celibacy. Now, why not arrange a system of international exchanges and make both sides happy? Let the married teachers go to France and the celibate come to America. Or, perhaps better still, let the wise men who have authority over the schools in the two countries get together and argue the matter out before they carry out their opposing plans of regulating the domestic affairs of those who are so unfortunate as to be in subjection to them.

The argument of the French is that celibates are so abnormal in their lives, dispositions and status in society that they are not fit persons to serve as educators. This seems somewhat plausible at least.

The argument of the Americans is that if married a woman ought to be supported by her husband and not at the expense of the community. This also sounds well, but in making this plea they virtually admit the worst charges that have been made against the managers of schools in the United States. They have often been accused of disposing of the places under their control for the benefit of the teachers, not of the schools. The positions were patronage, spoils, to be divided among the victors in a political fight, or bestowed on the needy. We have all laughed at the country town (variously located) which elected a street loafer justice of the peace on the ground that he had to be supported by the town some way, and in this position something could be got out of him in return.

Now a Home for Incurable Old Maids is a worthy charity; and in these days of municipal expansion it would not be at all out of the way for a city to provide for a few years light and agreeable occupation for nice young girls who have not yet found themselves, or a husband, but we object to using the public schools for these philanthropic purposes. Any of the school-ma'ams who are not giving a full equivalent for their salaries, but are in part supported by public charity, ought to be discharged without waiting till they are married, and any member of a school board who is guilty of keeping such a teacher on the pay roll ought to be put in the penitentiary for misappropriation of public money. Our children are so important that they deserve the best teachers obtainable, and it ought not to make any difference whether a teacher is rich or poor, married or single, Republican or Democrat, Methodist or Catholic, born in the town or imported from another State. From a theoretical standpoint it would seem that the fact that a woman has been found lovable and attractive enough by some man to be selected as his wife does not prove that she is less suitable as a teacher than her col-

leagues whose possession of these qualities has not been so evidenced, and it is not self-evident why a woman who has had children of her own is for that reason disqualified for taking care of the children of others.

A Suggestion for Church Union

WE recall that some thirty-five or forty years ago the retiring Moderator of the Presbyterian General Assembly preached a sermon which was notable at the time for the slur it cast at the Episcopal pulpit. Certainly since Phillips Brooks became the prince of American preachers there has been no justice in calling it "imbecile," and very far from imbecile is the Episcopal press. Certainly, if we were to choose the two most ably edited denominational papers in the United States, we could find none more able than *The Churchman* of this city and *The Church Standard* of Philadelphia. They freely discuss large and live subjects. And it is one of the few advantages of personal journalism—perhaps, the only one—that the name of the editor both gives and receives distinction. One can give credit to Mr. McBee for so admirable and conclusive an argument in last week's *Churchman* against establishing a diocese within a diocese in certain States, an argument which we commend to the Presbyterians, who have just been officially advised to do that very thing, in order to facilitate union with the Cumberland Presbyterians. And so we can honor Dr. John Fulton for his attempt in *The Church Standard* to break down the wall which separates Episcopalians from other denominations.

In the last of a series of eight elaborate editorials on "The Attitude of the Episcopal Church toward Non-Episcopal Churches," that journal offers not a plan, but suggestions, toward union with both the Presbyterians and the Methodists. We will consider simply the latter, inasmuch as the differences of Methodists and Episcopalians are not so wide as those which separate the latter from the Presbyterians, and therefore a basis of union is not so far to seek. The *Standard* tries to make the passage as easy as possible, and, indeed, does not propose any absorption whatever, nor any union except perhaps fifty years hence. What separates is not bishops, as with the Presbyterians, but simply the matter of a questioned validity of orders. So what is asked is not that the Methodist clergy should accept reordination by the Episcopal bishops, so as now to validate the orders of all of them, but simply that a dozen or so Methodist bishops shall consent to be reconsecrated. It says:

> "All that would be necessary in this case would be that the Methodist Bishops actually elected and holding office should consent, not by way of subjection or submission, but for the sake of future unity among the followers of Christ, to accept a hypothetical or conditional consecration from Bishops of the Protestant Episcopal Church. If that were done, the whole difference of Orders between the two Churches would disappear within one generation."

Meanwhile, there might be, it is suggested, a concordat between the two, providing for mutual exchange of pulpits, and conditions of comity could be arranged.

That looks very easy. We shall be much pleased to see it done. And yet, we fear that it looks easier than it will prove to be. It is simply that the Methodist bishops shall accept conditional consecration from the Episcopalian bishops, without at all denying that they have been already validly consecrated. It is not to satisfy them, but to satisfy the Episcopalian bishops, who do not believe that they were so consecrated as to be validly in the true succession. If now the Methodist bishops will only take this Episcopalian consecration, then both will be satisfied, and all the Methodist ministers subsequently ordained will be in the true succession, and all the old ministers who are willing to be reordained.

We say this looks very easy. But let us carry it a step further. Episcopalians say that Methodist ordinations are now invalid because of a break in the succession. But Roman Catholics say that Episcopalian ordinations are invalid for the same reason. Professor Briggs says that for the sake of union he would have the Episcopal ministers and bishops be reordained by Catholic bishops, whose true succession is not in question. We ask, *pace* Dr. Fulton, will Episcopalians here follow Professor Briggs, who is willing to take a dozen ordinations for

the sake of Church unity? The relation of the Methodist Church to the Episcopalian is precisely that of the Episcopalian to the Roman Catholic. Methodists and Episcopalians are equally confident as to their own true ordination, while Episcopalians and Catholics equally deny the true ordination of the denominations that came out from their fold. Why should not Episcopalians first get unquestionable orders from Rome before proposing to impart orders to others? Would not the Methodists be in a better position, as far as unquestionable succession goes, if the Episcopalians would first validate their own position, so that the Methodists would not have to do it over again a little later?

We have discussed the matter from the ecclesiastical side; we should have to discuss it otherwise from the Christian side. Jesus told the Samaritans that the time was coming when neither in their mountain nor in Jerusalem should they worship the Father. He did not mean it literally, and probably there has been no time since then when on both hills God has not been worshiped. He meant that under Christianity, in the kingdom of heaven, matters of place or ritual are of no importance; they belong to the doctrine of the Pharisees, which must pass away, when the Father will be worshiped spiritually, "in spirit and in truth." Under Christianity it is absolutely of no importance when or how a minister is ordained or a bishop consecrated. To insist on one way and deny the equal value of another way—to concern one's self about continuity or break, as if it made or marred the Church, is the doctrine of Judaism, and of the Pharisee sect, at that.

But the question will then rise, If it is unchristian to insist on a certain sort of ordination as essential, is it equally unchristian to insist on refusing a certain sort, at the price of perpetual disunion? That question Methodists must answer to Episcopalians, and Episcopalians to Roman Catholics, and the right answer may not be clear. Paul would not consent, for the sake of union, that all should yield to circumcision, but he was willing, for himself, to yield the shaving of his head. Would he have yielded that all must shave their heads? What would have been the effect on the Christian Church if Paul had yielded the question of circumcision? Would it have made for spirituality and Christian liberty? What would be the effect on the Christian Church now of insisting on one sort of valid ordination to the rejection of another? Would it make for more spirituality or more formality? That is the serious question.

When will people learn that union cannot begin with the word *must,* but only with the word *may?* An iota separated the Church once—the difference between *homoousion* and *homoiousion;* an auxiliary splits it now into subdichotomies of schism. The only vital union must come with liberty—liberty of administration, liberty of interpretation, the removal of all impassable bars, the welcoming into the Christian Church of all who want to follow Christ, no matter what their creed, no matter how they ordain, no matter how or whether they administer the sacraments, no matter how they run their polity. Any test for union should be judged by the royal law of liberty.

What the Russians Will Do

The *Moscow Gazette* has decided what will be done as soon as the Japanese are conquered. There will be no question, it is said, of a second Congress of Berlin to rob the victors of their spoils. Korea is to be annexed, or, at least, the Japanese wholly excluded, and its most important ports fortified. The island of Tsushima is to be seized and strongly fortified, forever to exclude the Japanese from disturbing the peace of the Orient. The rest of Japan may be left alone, except Formosa, which is to be set "free" under Russian protection. Neither British nor American interference is to be feared, because in the former case all that would be necessary would be to send an army into India by the way of Herat and another through Tibet, while the United States could be attacked by crossing into Alaska over the ice bridge at Bering Strait! We have had some marvelous strategy displayed by our own yellow journals, but nothing equal to this. The spectacle of Russia driving the Japanese out of Korea and at the same time climbing over this icy "roof of the world" to invade India, and effecting the conquest of America via

Alaska, is so portentous that we have no doubt it will insure Anglo-Saxon neutrality. But now the secret plans of Russia are out, our General Staff should provide for this contingency, which they seem to have overlooked. Hitherto the few surveying parties who have passed through Northeastern Siberia in search of a practicable all-land railroad or telegraph route have nearly perished of starvation in these Polar deserts, but if a big Russian army is coming that way, some 12-inch guns ought to be put on the American side, for there is no knowing but the Russians might even put a railroad across the Strait over the ice as they have on Lake Baikal.

Railways in the Philippines

Why should not the Philippine Government, supported by the credit of the United States, construct on its own account the railroads that are so much needed for the development and prosperity of the islands? Secretary Taft came to New York last week and asked a group of railway capitalists and other financiers how much Government aid would suffice to cause the construction of these railroads by private capital. He suggested a guaranty of a net income of 4 per cent., it is said, but this did not seem to be attractive. If private capital turns away from a guaranteed interest of 4 per cent., with such additional profit as might be earned, here is an inviting opportunity for an experiment in Government ownership and operation in isolated territory where conditions would permit it to be made without the embarrassment of relations with railways owned by private corporations. It would do us no harm thus to become familiar by practical experience with the possibilities and comparative merits of Government ownership in the field of railway transportation. The proposition is at least one that deserves to be considered and discussed.

The Hudson River Tunnel

They did pretty good engineering work in the old days without theodolites or derricks, but it was hardly as exact as that which we do to-day. The two headings of the Hudson River tunnel met so accurately last week that they did not miss their alignment by the visible fraction of an inch. When King Hezekiah dug a tunnel eighteen hundred feet long from the Fountain of the Virgin to the Pool of Siloam he had no instruments of precision, and his task was all the harder because he had to curve the tunnel to avoid the Tombs of the Kings. And yet the two ends met with no great deflection, and a workman scratched on the wall of the tunnel, at the place of junction, a record of the event, which tells us how the workmen on one side were cheered by hearing the drilling on the other side, and then how they met and completed the work. It was not as great a task of engineering as the Pyramids or the Hudson River Tunnel, but it required no small amount of skill. Tunnels were very important in the days when a city's supply of water might be cut off by an enemy. We have come again into an age of tunnels which will revolutionize the transit facilities of our great cities.

A Democratic Dedication

It is an interesting and unusual fact in connection with the opening of the new Mount Sinai Hospital in this city this week that there are no dedication exercises. This is a magnificent building, provided at a cost of nearly three million dollars by the Jews of this city, who refused to take any subscriptions for it from Jews out of town or from Gentiles anywhere, while opening it to patients of all faiths. They planned to have a grand opening, with the President and the Governor in attendance; but they found that not one of the wards was large enough to hold those that would have the right to attend. One of the trustees, who gave $175,000, declared that the poor East Side Jew who gave five dollars, and who would have given as much as himself if he had had the money, had equal right with himself to be present. So they decided to give up the ceremony and have in place a reception for two days, to which all subscribers and friends would have equal admission. Our Hebrews have learned the lesson of American democracy, and are good teachers of it. In the present Eastern war they have not forgotten that they

are Americans first, as appears in their most creditable self-restraint, considering their hostility to Russia. They are offering no battle ships to Japan, but merge their sympathies with those of the American people.

Chinese Peonage in South Africa

Parliament has passed the desired Chinese legislation for South Africa, but the King—that is, the Government—delays putting it into operation for the present, which we hope means indefinitely. We do not see how this identical system differs in principle from slavery for a limited term. The Chinese laborers imported to work the mines are prohibited trading, or holding any license that might compete with white labor; they cannot lease or purchase land or possess any economic rights. They can be transferred by assignment from one master to another. They will be confined in a compound, which they may not leave without a signed permit from the importer, and any one leaving without such permit is liable to arrest without warrant, and the deserter is liable to a fine of $250, which he will have to work out. This is simple peonage, with scant pay to those who survive. It is not essential to the welfare of the world that the gold and diamond mines of South Africa get cheaper labor than the mines in other countries. They can get all needed labor if they will pay fair market wages. And it is not a pleasant thing to see Great Britain going back on her seventy years' record since the time of William Wilberforce and George Thompson.

The Poll Tax Provision

The working of the new poll-tax provision in the legislation of certain States should be watched with care before it is imitated elsewhere. In Alabama, for example, the new constitution has been in effect two years and a little more, and one election has been held under it. It provides, among other things, that the poll-tax of $1.50 a year must be paid not only for the current year, but for every year since its adoption. If a man fails for two years, he must pay $4.50 the third year. At the last election 45,000 white men were disfranchised for failure to pay their poll-tax; and this cumulative poll-tax will result in a cumulative reduction in the number of voters. There was no election last year, and so no incentive to pay the poll-tax, and those who voted at the last election will lose their vote unless they bring receipts for $3.00, and that paid in February, while the election is in November, when probably 100,000 white voters will be excluded. This means an aristocratic electorate, the poor being disfranchised; and those whose money gives them the suffrage will not be anxious to extend it. Having the power they will prefer to keep it; and no change in the constitution can be made in less than five years. A similar condition is arising in Virginia, where the new constitution went into effect this year. Any one previously on the register list is put on a permanent register list and can vote, but only if he has paid the poll-tax of $1.50 six months in advance. If he was not on the list he must pay for three years preceding. The effect will be the same as in Alabama. It will result in government by an aristocracy, which many people prefer. How many are there who really trust the common people? Another result will be corruption in the payment of the poll-tax. Read this, as to a recent election fight between two Democratic factions in Memphis, Tenn., writen by "Ex-Confederate":

> "Without a thought of past experience Southern Democrats paid poll-taxes for negroes so as to secure their votes."

And thus many of both colors voted for the faction that paid their tax—and something besides.

The Degree of Doctor of Divinity

The degree of Doctor of Divinity is usually merely honorary, like that of Doctor of Laws. An announced enlargement in the course of the Union Theological Seminary in this city seems to look toward making a degree that shall be given for attainments in theology and on examination, just as the degree of Doctor of Philosophy has ceased, among all reputable institutions, to be an honorary degree and is given purely for scholarship after a course of study and original research. The transfer of Professor Briggs from the chair of Biblical The-

ology to that of Theological Encyclopedias and Symbolics is one step in the new direction, which plans for an increase in the professorship and a three years' course for those who have graduated from the usual theological course, and who, on completing such a further course of study and proving their fitness, shall receive the degree of Doctor of Divinity. Dr. Briggs's new professorship might well provide work for more than one man. Symbolics alone ought to include the comparative study of the doctrinal positions of the chief religious bodies, as stated in their official confessions of faith, and also a study of Irenics, which would show what is their consensus, eliminating their differences in order to determine the principles and methods of reconcilation. We are informed that Professor Briggs will spend the coming year abroad preparing for his new duties.

We have had another week of the investigation of the Mormon Church, but nothing has come out which changes our opinion that Mr. Smoot cannot be excluded from his seat in the Senate. That is proved, which everybody knew, that quite a number of the older men, including half of the Twelve Apostles, continue to live in polygamous relations, and that it is not the policy of the State of Utah to disturb those who do so, so long as there are no new polygamous marriages. It is also proved that Apostles must either get special permission from their associates to accept political office or must resign their Apostleship. But we do not see that this is a reason for excluding Mr. Smoot. Mr. Depew was required to resign the Presidency of the New York Central Railroad when he became United States Senator.

Our Congressmen might not have got into such a passion over the contents of the Post Office report which they asked for if they had not been so busy in getting offices for their constituents. Mr. Hepburn, of Iowa, says that if it is a fault to do such favors he has been guilty ten thousand times in the 23 years of his service in Congress, and he is proud of it. We like better the record of the Street Cleaning Department in this city, whose head, Major Woodbury, says he has succeeded because for two years not a man has been appointed or removed for political reasons. Mayor Low never interfered with him, and we trust Mayor McClellan will not. Tammany wants one visible proof of its goodness.

While Germany has just removed the last of restrictions against the Catholics, by rescinding the law which excluded Jesuits from teaching, France is proposing legislation utterly to forbid all teaching, in public or private schools, by members of religious orders. Germany, more than half Protestant, can allow freely what France, almost wholly Catholic, cannot allow at all. It looks strange; it is wrong. In Germany liberty of religious thought feels strong enough to take all risks. What France needs now is to abolish the Concordat, to put the support of the Church on the free will of its members, to grant full liberty of teaching to all, at their own expense, and then let the best win.

It was a courtesy for the Emperor of Germany to present to the United States a statue of Germany's great soldier, Frederick the Great. It was only decent for President Roosevelt to accept it as courteously, and it is not decent for men in public positions to resent the gift. Our War College or Naval Academy is a good place to erect such a statue, or a statue of Alexander, or Julius Cæsar, or Napoleon, if any one chooses to give it; and there it would be as much in place as the Twelve Apostles on the Milan Cathedral.

General Kuropatkin, who is starting to command the entire Russian military forces in the East, talks big. He told a French correspondent that after driving the Japanese out of Manchuria and Korea he proposed to overrun Japan, and have the treaty of peace signed in Tokyo. That sounds fine. And yet we remember an old military leader of some distinction in the Near East, who said: " Let not him who girdeth on his armor boast himself as he that putteth it off."

Insurance

Accidents and the Seasons

THE changing seasons bring with them accidents that are peculiar to each, and the companies engaged in the business of personal accident insurance are now preparing for the annual crop of spring accidents to follow those arising from icy pavements. Injuries from burns that have been a hazard during the long, hard winter are now passing, but these will be followed by injuries arising because of outdoor sports that will presently become seasonable. Last season the football casualties alone were nineteen lives lost, thirteen players severely injured, some of whom will be crippled for life. One boy became insane because of injuries sustained, while lesser injuries due to football reached well into the hundreds. Golf, baseball, polo, rowing, swimming and bathing—all furnish moving causes of accidents according to season. The automobile is becoming more and more of a danger. Accident insurance is something of a compensation when casualties come, and one never can know when falling building material may carry injury or death with it. A building may collapse at any time, and the elevator is by no means free from ever present danger.

Instalment Insurance

THE old idea of life insurance was to pay certain stipulated premiums annually, and in case of death without lapse in the payment of premiums the beneficiary received the face of the policy in a lump sum. It was presently found, however, that many women, beneficiaries as wives or near relatives of policy holders, were greatly embarrassed because of the necessity, under maturing policies, of handling large sums of money, to which they had not previously been accustomed. The suddenly acquired estate was too often wasted in their inexperienced hands, and the family ultimately found itself in actual want. Many men, with acquired knowledge of the limitations of certain members of the gentler sex, would not insure themselves in their favor with the collateral hazard thus signified.

In view of all this it was an excellent move in the development of contracts of life insurance to provide therein for the payment to the beneficiary of continuous or limited instalments, so as to make a stipulated income certain over a period of years. A practical guaranty by experienced financiers of the successful investment of funds arising because of the insurance policy was thus made, and the rate of interest was better than could otherwise have been obtained. Payments of insurance money under this instalment plan present certain features that will thoroughly appeal to the average man, who could, perhaps, not be induced, because of reasons generally well grounded, to accept a policy that would leave the wife a large sum of money at death. Instalment payments offer a solution for a vexed question in life insurance.

Insurance Lectures at Yale

THE following lectures in the insurance course at Yale University have been announced:

March 21.—"Economical Functions of Insurance with Relation to the Family," John M. Holcombe, of the Phœnix Mutual Life.

March 28.—"Economical Functions of Insurance with Relation to the State," John M. Holcombe.

April 1.—"Government Insurance," Professor Farnam, Yale University.

April 25.—"Governmental Insurance," Professor Farnam.

May 2.—"Insurance Law," Charles E. Gross, Hartford.

May 16.—"Industrial Insurance," John F. Dryden, of the Prudential.

May 30.—Special lecture, John A. McCall, of the New York Life.

June 6.—Special lecture, J. W. Alexander, of the Equitable Life.

THE Hartford Fire Insurance Company have insured the risks of the Hamilton Fire Insurance Company of this city, and the Commercial Union has re-insured the risks of the Greenwich Fire Insurance Company. The Providence-Washington Company, of Providence, R. I., has re-insured the entire agency business of the Firemen's Insurance Company of Baltimore. These are a few of the changes that have taken place as a consequence of the Baltimore fire.

Financial

The Shipyard Trust

It has been known for some time that Governor Odell was one of those who subscribed for bonds of the United States Shipbuilding Company, commonly called the Shipyard Trust. Last week his bonds (par value $188,000) were sold at auction. He had paid 90 for them; they were sold at 26, and his loss is $120,000. The Governor, it is understood, desired to be relieved of all connection with the company, at any cost, in order that he might be free to take any action which the duties of his office should suggest. It is now reported that the alleged violations of law in connection with the promotion of the company will soon be considered by a special grand jury in this city, and that the Attorney-General of the State will co-operate with District Attorney Jerome in the prosecutions that will probably ensue. There may also be a thorough investigation by a committee of the Legislature, altho at last accounts the Governor was inclined to oppose any legislative inquiry that should be confined to the affairs of the Shipbuilding Company.

Steel Corporation's Report

Full details of the year's business are given in the annual report of the United States Steel Corporation for 1903, issued last Saturday. Net earnings were $109,171,152, against $133,308,762 in 1902, a loss of $24,000,000, or 18 per cent. Therefore the year's surplus, remaining after the payment of all charges and dividends, was only $12,304,000, against $34,253,000 in the preceding year. By the conversion of preferred shares into the new bonds, the preferred stock has been reduced to $360,281,000. It was in the last quarter of 1903 that the sharp decline of business, which caused a suspension of the dividends on the common stock, seriously affected the company's income. In that quarter the net profits fell to $2,230,000, against $21,000,000 in the corresponding quarter of 1902. Undoubtedly, however, there has been improvement since the end of the year. This is shown in the steady increase of pig iron output, a very recent advance of prices in the wire and nail departments, growing demand for other products, and much activity at the present time in many of the Corporation's mills.

Within a month an electric railway from New York (Jersey City) to Philadelphia, with only one change of cars, will be in operation. The distance will be covered in about three hours, and the fare for a round-trip will be $2.25.

....The Western Union Telegraph Company's quarterly report, accompanying the usual declaration of dividend, shows (with business partly estimated) that the surplus on April 1st will be $14,607,028, against $14,360,345 on January 1st.

....William W. Woods, formerly Vice-President of the Central National, has been elected President of the Federal Bank. Robert A. Doolittle, for many years connected with the Importers' & Traders' National Bank, was elected Cashier. The capital of the Federal Bank is one quarter million dollars, the surplus fifty thousand dollars, and the total resources nearly nine hundred thousand dollars.

....The new officers of the New York Security & Trust Company, which recently combined with the Continental Trust Company, are as follows: Otto H. Bannard, President; Osborn W. Bright, First Vice-President; Willard King, Second Vice-President; Alexander S. Webb, Jr., Third Vice-President; Henry E. Ahearn, Secretary; Mortimer N. Buckner, Treasurer. Charles S. Fairchild, Ex-Secretary of the Treasury, was elected Chairman of the Board.

....Dividends announced:

Manhattan R'way Co. (quarterly), 1½ per cent. and extra 1 per cent., payable April 1st.

Chicago, Mil. & St. Paul R'way (preferred), $3.50 per share, payable April 22d.

Chicago, Mil. & St. Paul R'way (common), $3.50 per share, payable April 22d.

Mergenthaler Linotype Co.. 2½ per cent., payable March 31st.

Western Union Tel. Co , 1¼ per cent., payable April 15th

Otis Elevator Co. (preferred), $1.50 per share, payable April 15th.

Otis Elevator Co. (common), $2.00 per share, payable April 15th.

The Independent

Vol. LVI NEW YORK, THURSDAY, MARCH 24, 1904 No. 2886

Survey of the World

The Field of Politics

A few days before the recent convention of the Republicans in Ohio's Seventh Congressional District, word was sent to Senator Fairbanks (whose birthplace is in that district) that the convention, if he should not object, would name him for the Vice-Presidency. Replying, on the 14th inst., the Senator wrote as follows:

"I am not a candidate for the Vice-Presidential nomination. I have no desire whatever for it, and shall be very much obliged if you withhold any indorsement, so far as I am concerned."

—From Indiana comes a report that General Miles can be induced to accept a nomination for the Presidency on the Prohibitionists' ticket.—A Democratic member of the House from New York City has sought to promote the candidacy of Judge Parker by showing that the Judge's opinions in the Court of Appeals have been on the side of the labor unions in several important cases. These were opinions in which he dissented from majority decisions that declared certain labor laws (concerning hours and wages) to be unconstitutional. By means of the member's speech the opinions in full have been printed in the *Record* and thus made available for wide circulation at small cost during the campaign.—Mr. Hearst is gaining delegates in several States. The three District conventions that have been held in Ohio have chosen delegates in his interest. In that State he appears to be assisted by the influence of Tom L. Johnson and Mr. Bryan. He was successful in the primaries of three Illinois counties, last week, and at many primaries in Kansas. The California Democratic Commitee has adopted resolutions advising that that State's delegates be instructed in his favor. In the House, Mr. Hearst has introduced a resolution providing for a thorough investigation of the Trust question by a committee of five members. —A recent vote in the Nebraska Democratic Committee shows that Mr. Bryan's influence in that State has declined, altho a majority of the members are still in sympathy with him.—The Republicans of Ohio are divided by a bitter factional contest between the friends of Senator Foraker and those of the late Senator Hanna, whose leaders now are Governor Herrick and Senator Dick. This contest was precipitated by the recent appointment of Mr. Foraker's candidates for the post offices in Lima, Napoleon and St. Mary's. Mr. Foraker has published a long statement of the most aggressive character, and it is reported that his factional foes will attempt to exclude him from the State's delegation to the National Convention. The Governor remarked in a public address that the party would demand equal consideration and respect at Washington for the two Senators. Mr. Foraker replies that for years he has had almost nothing in the way of appointments, and that if his influence should be dominant with respect to all the Federal patronage of the State for three years to come, there would still be less than half to his credit. Governor Herrick admits that he has written to the President about this quarrel. In the conventions of two Congressional Districts there have been factional divisions and violence.—In the Canadian House of Commons Sir Wilfrid Laurier said, last week, that the High Joint Commission would not meet again upon

Canada's initiative. The Dominion Government had decided to make no advances of any kind to the United States. He denounced the Trusts that were associated with our high tariff, adding that he greatly admired the States and the American people.—Governor Warfield, of Maryland, has approved the bills recently passed by the Legislature of his State requiring separate coaches in steam cars, and separate compartments in steamships, for negroes. Pullman coaches and through trains are excepted. Among those who protested against this legislation was Cardinal Gibbons.—Republican factional differences in New York appear to have been removed by a conference held last Sunday, at which it was agreed that Senator Platt should be recognized as leader in the State, that Governor Odell should be elected Chairman of the State Committee, and that the Governor should be neutral with respect to Senator Depew's candidacy for re-election.

Important Pension Order

An order issued on the 16th by Pension Commissioner Ware and approved by Secretary Hitchcock, makes old age (beginning with 62 years) a pensionable disability under the pension act of 1890, and thus, it is commonly thought, satisfies the demand for a service pension law without requiring the enactment of the Sulloway bill or any similar bill now pending. It is understood that the issue of this order was preceded by a careful consideration of the matter by the President, the Commissioner and the Secretary. The order says that the Act of 1890, as amended, provides that a claimant shall "be entitled to receive a pension not exceeding $12 per month and not less than $5 per month, proportionate to the degree of inability to earn a support," and that "in determining such inability each and every infirmity shall be duly considered, the aggregate of the disabilities shown to be rated." It then declares that "old age is an infirmity;" points out that in 1887, thirty-nine years after the close of the Mexican War, all soldiers of that war who were over 62 years old were pensioned; adds that on April 13th, 1904, thirty-nine years since the end of the Civil War will have elapsed, and orders the following course of procedure:

"(1) In the adjudication of pension claims under said act of June 27th, 1890, as amended, it shall be taken and considered as an evidential fact, if the contrary does not appear, and if all other legal requirements are properly met, that when a claimant has passed the age of 62 years he is disabled one-half in ability to perform manual labor, and is entitled to be rated at $6 per month; after 65 years, at $8 per month; after 68 years, at $10 per month, and after 70 years at $12 per month.

"(2) Allowance at higher rate not exceeding $12 per month will continue to be made as heretofore, where disability other than age shows condition of inability to perform manual labor.

"(3) This order shall take effect April 13th, 1904, and shall not be deemed retroactive. The former rules of the office fixing the minimum and maximum at 65 and 75 years, respectively, are hereby modified as above."

Estimates of the cost of the order in additional payments range from $3,000,000 to $10,000,000 a year. Chairman Sulloway, of the Pension Committee, says that this action of the Bureau carries out the intention of his Service Pension bill, now pending.—The President has appointed "Corporal" James Tanner, formerly Commissioner of Pensions, to be Register of Wills in the District of Columbia. Louis A. Dent, the present Register, is to be Consul at Dawson, in the Klondike mining district.

Postal Service Questions

As originally reported by the House Committee, the bill prolonging the period of the statute of limitations from three years to five years provided that persons protected by the three years' limit might be prosecuted hereafter if their offenses fell within the new limit of five years. Some said that this would permit the indictment and prosecution of Perry S. Heath. The bill was recommitted, and has now been reported again, so changed that it protects persons who are exempt from prosecution under the present limitation.—It appears that one John W. Pettit was carried on the pay roll of the Baltimore post office for four years without rendering service for the salary thus received. The Department having brought suit to recover this money, Postmaster Warfield publishes a statement, saying that he was notified in writing on July 14th, 1898, by Mr. Heath, then First Assistant Postmaster-General, that $600 had been added to the salary

allowance for his office, and that he was directed in the same letter to pay this sum to John W. Pettit. This he did, and afterward, under instructions from the Department, paid an increase of this salary, thinking it was not his duty to question the acts of his superior officer and to inquire concerning Pettit, who, he says, received all the money for which he has now been sued.—It is expected that Senator Dietrich will be exonerated by the Senate Committee that has taken testimony relating to the charges against him. W. S. Summers, the District-Attorney who caused his indictment in Nebraska, will be removed from office.—Mr. Roosevelt has directed that the inquiry concerning the New York Post Office be continued. It is asserted in Washington that the investigators recommended the removal of Postmaster Van Cott.—Testifying before a House Committee, Fourth Assistant Bristow said, last week, that only the first seven pages of the postal report which recently caused so much disturbance in the House were seen by him before his illness. The parts relating to clerk hire had been prepared in the office of the First Assistant; the remainder had been prepared in the Fourth Assistant's office at the direction of the Postmaster-General, to whom it was submitted by those who wrote it.

Work and Talk in Congress

The nomination of General Leonard Wood to be a major-general was confirmed on the 18th, after a delay of more than six months, by a vote of 45 to 16. Two Republicans (Messrs. Scott and Kittredge) voted against it, and five Democrats (Messrs. Cockrell, Dubois, Pettus, Patterson and Clark, of Arkansas) in the affirmative. Since the death of Mr. Hanna the strength of the opposition has been reduced. One of the charges against General Wood related to the game of *jai alai*, as played in Havana. A recent executive session of the Senate was enlivened by the attempts of a few Senators of advanced age to enlighten their associates, by actual practice, as to the nature of the game. The friends of General Wood urged that a vote be taken on the 18th, because Mrs. Wood was to sail for the Philippines on the following day. Under the customary rule of seniority, General Wood, if he lives, will probably be Lieutenant-General at the head of the army for about 15 years, beginning in 1909.—An interesting decision has been made by the House Committee on Elections in the contest of Dantzler, a negro, against Lever, the sitting member from the Seventh District of South Carolina. The decision is against Dantzler's claim, but not positively in favor of Lever. The latter, however, will retain his seat. Dantzler asserted that the suffrage restrictions of South Carolina's Constitution and laws were in violation of the Reconstruction acts, and that he would have been elected if the negroes had not been disfranchised. The committee says that if the election were held to be invalid on that ground, the decision would be a precedent for unseating nearly every member from several Southern States, and that the vacancies could not be filled until after a modification of the local constitutions and laws. The proper forum for such questions, it adds, is the Supreme Court of the United States.—A majority of the subcommittee to which the charges against Judge Swayne, of the Northern District of Florida, were referred have reached the conclusion that he ought to be impeached.—Speaking in defense of the attitude of the South toward the negro, Mr. Spight, of Mississippi, in the House, last week, caused some surprise by asserting that a lynching in the South had never been followed or accompanied by attacks upon negroes because they were of the same race with the guilty man. This had repeatedly been done in the North, as at Danville, Ill., and Springfield, O.; but such race prejudice, he said, found no place in the South. The reception of Booker T. Washington at the White House, he continued, had done more to inflame the passions of the negroes than any other event in ten years. The more they were encouraged to believe in social equality, he said in conclusion, the more dangerous would be their position and the more sure the death by violence which would overtake them sooner or later.

Labor Controversies At Telluride, Col., on the night of the 14th, one hundred armed members of the Citizens' Alliance took seventy-five members of the local miners' union from their homes by force, put them on a special train and deported them to Ouray, firing a volley with their guns as the train started from the station. Among those who were thus expelled was A. H. Floaten, leader of the Socialist Party and President of the People's Supply Company. The door of his house was broken down, and he was marched to the train in his stocking feet. All these men were warned never to return. Officers of the Western Federation of Miners at Denver have instructed them to return, well armed and prepared to fight.—By a vote of 98,514 to 67,373, the United Mine Workers of the bituminous mines of Ohio, Pennsylvania, Indiana and Illinois have decided not to strike, but to accept the proposed wage reduction of 5½ per cent. This is a compromise, the employers having asked for a reduction of 15 per cent., while the men demanded an increase or, at least, a maintenance of the old rate. The miners were earnestly advised by President Mitchell to accept this compromise, which will determine the rate of wages for two years to come.—A serious controversy between the builders and their employees in New York has withdrawn 20,000 men from work and may cause a renewal of the labor war that made 100,000 workmen idle for several months last year. This new controversy originated in a strike of the unskilled laborers known as bricklayers' helpers, a majority of whom are hod-carriers. By the agreement reached at the close of last year's quarrel in the building industry, the associated employers bound themselves not to reduce wages or increase hours for one year. This agreement was broken when the mason builders gave notice of changes in hours and overtime allowances that were equivalent to a reduction of the helpers' wages. Owing to the withdrawal of the helpers, the bricklayers were unable to work. After a few days, 6,000 of them went on strike in sympathy with the helpers, thus breaking their agreement with the employers, which bound them to refrain from striking and to submit all differences to the Board of Arbitration. Because of the action of the bricklayers, other skilled workmen on the large steel frame buildings are compelled to be idle. The employers have rescinded the order or notice over which the controversy began, and have invited the laborers to resume work, pending arbitration; but the laborers insist upon conditions which the employers reject. In this attitude the laborers or helpers are supported by the bricklayers; and at the beginning of the present week it was feared that unions of other skilled workmen would join in the revolt.—The American Tin Plate Company, a part of the Steel Corporation, has offered to resume work at all of its mills that are now idle; if the union (Amalgamated Association) will accept a wage reduction of 18 per cent.

Abrogation of the Sulu Treaty The treaty made in August, 1899, by General Bates with the Sultan of Sulu and his dattos, or chiefs, was abrograted on the 2d inst. by order of the President, because, the official notice says, the Sultan and the chiefs who signed it have "failed to discharge the duties and fulfil the conditions imposed upon them," and thus have "forfeited all right to the annuities therein stipulated to be paid to them." They have been informed that "as residents of the Moro Province they are subject to the laws enacted therein under the sovereignty of the United States." Secretary Taft said in Washington last week that the treaty had never recognized slavery or polygamy, the clauses relating to those subjects having been eliminated by President McKinley before he approved the agreement.—Because of the new anti-slavery law the Moros of Mindanao are again in a fighting mood. General Wood has captured their fort, near Cottobato, and with it fifty old Spanish or Moro cannon.—Secretary Taft tells a House Committee that the islands need from 700 to 1,000 miles of railroad, and that he has been assured by capitalists in New York that they would undertake the work if the Government should guarantee a certain income. He thinks the insular treasury could stand an annual charge of

$1,000,000, the sum required for a guaranty of 4 per cent. on the investment that is needed. It was true, he said, that railroads in the British Eastern possessions were commonly built by the Government, but that policy he did not approve.—Sixto Lopez, the Filipino agitator, is to be deported from the islands because he refuses to take the oath of allegiance, altho Fiske Warren, of Boston, has offered to give a bond of $100,000 for his good behavior in Manila.—In this country there has been formed a Philippine Independence Committee, among the members being Presidents Eliot, Schurman, Jordan and Hyde; Bishops Potter, Spalding and McVickar; Andrew Carnegie, Wayne MacVeagh, Judge Gray and Dr. Parkhurst. The committee is circulating a petition asking the national political conventions to adopt resolutions "pledging to the people of the Philippine Islands their ultimate national independence upon terms similar to those offered to Cuba."—During his recent tour of the Hawaiian Islands Governor Carter was received in a most friendly way by the natives, whom he urged to give up their Home Rule policy and party. The Governor thinks, it is said, that the island of Hawaii, which is larger than Porto Rico, and almost as large as Connecticut, could sustain a population of 1,000,000 (instead of only 46,000) if its agricultural wealth should be developed by railways and immigration.—It is said in Washington that Senator Penrose will oppose the new treaty with Cuba concerning the Isle of Pines, and that he expects to be supported by a majority of the Senate. He asks for annexation. The original treaty lapsed by reason of his hostile action.

The Break-up of British Parties

The snap division a few days ago in the British House of Commons by which John Redmond, leader of the Irish Nationalists, secured a majority of eleven over the Government, is hardly a surprise in view of the present disorganization of political parties. That disorganization is emphasized by the latest Liberal victory in East Dorset, preceded by three other victories. It may safely be said that never before in British parliamentary history has there been such a breaking up of long established political affiliations, never such a confusion of historic divisions of political opinion, nor, with one exception, such uncertainty and incompetence among leaders. Mr. Chamberlain alone seems to know his own ground. The Irish Nationalists stand apart, avowedly watchful of the situation in their own interest and unpledged to any party. The triple division of the British electorate into Conservative, Liberal-Unionist and Liberal, which obtained until Mr. Chamberlain declared his fiscal views, has been increased until it is very difficult to know the exact voting strength of the different sections. Mr. Balfour's supporters are composed of what may be called Chamberlainites, who recently commanded 115 votes, and who are pledged to a moderate food tax and the preferential tariff; Retaliationists, who support Mr. Balfour's view that the power of meeting hostile foreign tariffs with specifically adverse British legislation is sufficient for the present, and high protectionists of the old school. The free traders, both Liberal-Unionist and Conservative, who were elected to support the Government, have transferred their allegiance to the Duke of Devonshire. The Liberals themselves are divided into Imperialists under Lord Rosebery and Little Englanders under Sir Henry Campbell-Bannerman. Sir W. Vernon-Harcourt, the ablest debater among the opposition, has announced his retirement. Lord Rosebery is unsatisfactory to the Nonconformist Liberals. Sir H. Campbell-Bannerman is not of the timber of which premiers are made. Mr. Asquith is perhaps the strongest figure on the Liberal side. With such a medley forecast is needless. It seems probable, however, that in the event of a general election and the triumph of the Liberals, Mr. Chamberlain will be best fitted to combine under his leadership the various party elements opposed to them.

The King Governing

The theory that in England the King reigns, but does not govern, has become somewhat questionable in view of the two recent instances of royal intervention in very important matters. The plan for the reorganization of the army and establishment of a general staff,

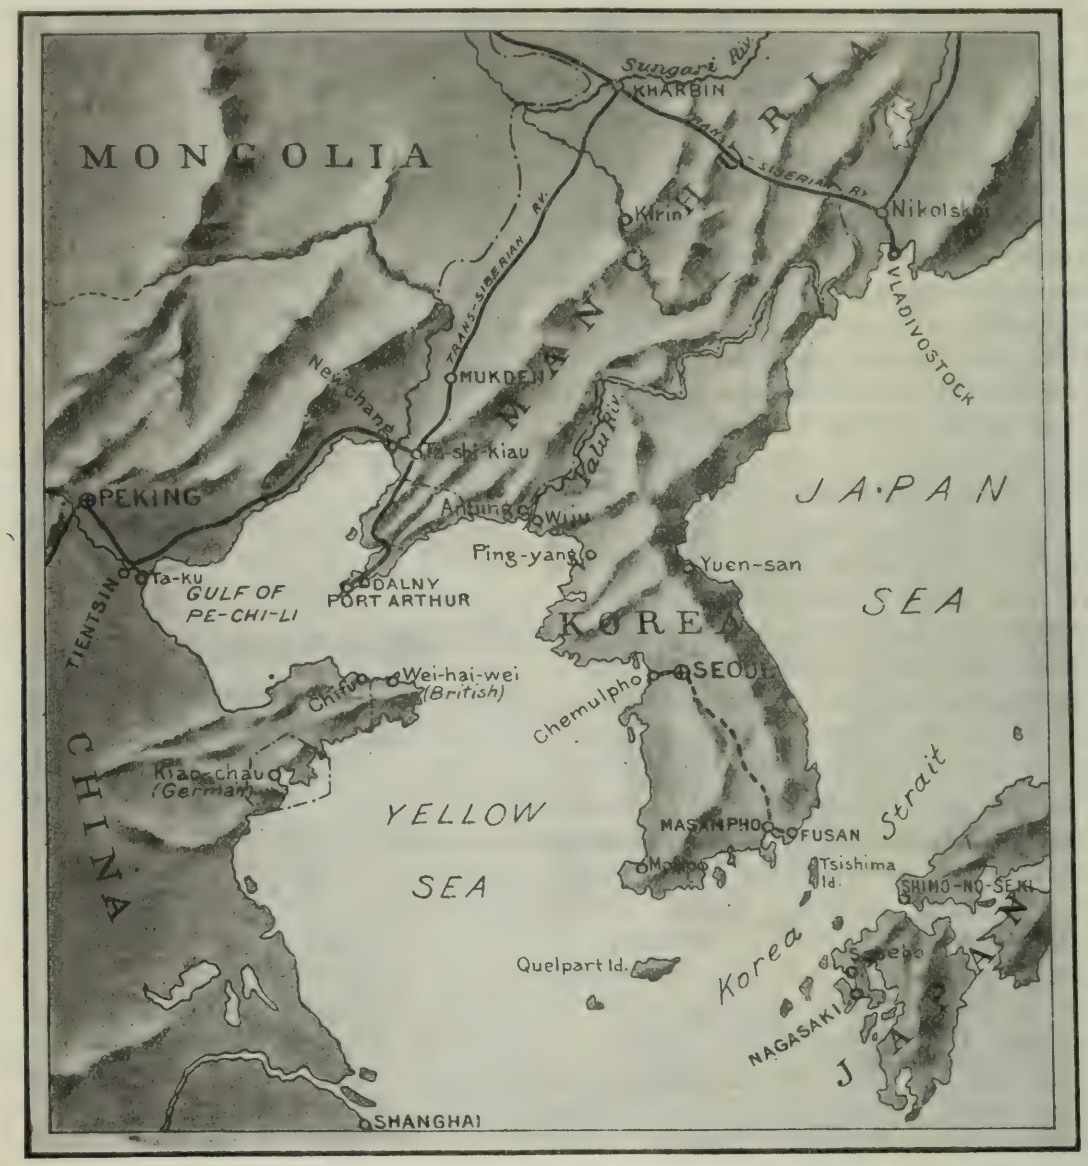
which was disapproved by at least two members of the Government, was not brought before Parliament, but put into effect at once by royal proclamation. And now the measure for the introduction of Chinese laborers into the Transvaal, which passed the Legislative Council, has been suspended in its operation by the King, altho it was declared by its advocates in South Africa to be a matter of immediate necessity to save the country from financial ruin. Whether the new act is prevented from going into effect by the King on account of his personal disapproval of the policy, or because of the vigorous protests made against it by New Zealand and other colonies. or because the present time is not a suitable one for the negotiations with China for the supply of coolies is not known.—The Duke of Connaught has been appointed Inspector General of the Forces, the most important position on the new General Staff at the head of the army.

Germany

The last vestige of the "Kultur-Kampf" legislation was wiped out March 9th by the repeal by the Bundesrath and the Reichstag of the paragraph of the law of July 4, 1872, prohibiting the Jesuits from living in Germany. Altho Bismarck said he would never "go to Canossa," still during his own lifetime he found it necessary to relax the rigor of the Falk laws against the Roman Catholic Church and to make terms with the Clericals to get support against what he regarded as the greatest enemies of the country, the Social Democrats. Since his retirement and death the Emperor has come more and more to rely upon the Clerical party in securing appropriations for his plans for the development of the navy, as well as the repression of the Socialists.—In the Reichstag of late there have been several attacks on the Government for the friendliness of Germany for Russia, and in particular for permitting the presence and acitvity of the Russian political police in Germany. The Government was charged with assisting in the arrest and return to Russia of Socialists and "terrorists," many of them students of both sexes. Herr Bebel, the Socialist leader, asked for a law prohibiting the admission of foreign police agents to supervise foreign subjects in the German Empire. He declared the persons extradited were not in any way dangerous characters, and the literature circulated was that of the Social Democratic party. The charge had been made by Baron von Richthofen that the Russian women students were living in "free love," but he asked if many of the villas of the west end of Berlin and its suburbs would not be vacant if all those living in such a state were expelled. The Imperial Chancellor, Count von Bülow, himself appeared to reply to this, and stated that the object of the Government was to cooperate with other civilized nations in stamping out anarchism.

"It was to this end that a Russian agent had been permitted to reside in Berlin in order to keep a watch upon Russian Anarchists. During the last decade Presidents Carnot and McKinley, the Empress Elizabeth of Austria, Señor Canovas, M. Sipiaguine and others had fallen victims to the revolver or dagger of murderous ruffians. Were they to shrink from taking international measures against ruthless men whose creed was terror and murder?"

Count Tisza's Victory



The obstruction or dilatory tactics in the Hungarian Chamber, which has been carried on so successfully by the Independence or Nationalist party ever since the autumn of 1902, has not been suppressed by the Hungarian Premier, Count Tisza, by the threat of very stringent measures against the interference of the minority with parliamentary proceedings, which has at times caused the Chamber to resemble a street riot rather than a deliberative body. The army and recruits bill for 1903 had been held up, and there was no prospect that the bill for 1904 could be put through, consequently some 50,000 Hungarian reservists and a number of recruits whose time had expired were kept in the ranks, causing much suffering to their families. Count Tisza, like "Czar" Reed in this country, decided that it was necessary to put a stop to this, and proposed a "guillotine" amendment to the rules governing the house when motions relating to appropriations, recruits, treaties and parliamentary rules were before it. This amendment provided that after hearing two speakers, the Presi-

dent could call for a vote on any of these measures; that reports of parliamentary commissions be handed in within a fixed time; that roll call be abolished; that the President should, on request of 50 Deputies, fix the maximum time of debate; that a session should not close until a vote was taken on the measure; that the debate cannot be interrupted in any way; that the President should have power to prohibit speeches for the purpose of wasting time, and to exclude uproarious or disobedient Deputies. It was expected that the discussion of this proposal would rouse greater tumult than ever before in the house, but it was supported by most of the Liberals, and a motion to place it on the calendar was passed by a vote of 238 to 107, the Croatian delegation voting in its favor. As soon as this was passed Count Tisza rose and withdrew all bills on the table, including the recruit bills for 1903 and 1904, in order to proceed at once to the discussion of his amendment. This meant the indefinite postponement of the release of the reservistes from active duty, and Koloman Thaly, the acting head of the Independence party during the illness of Franz Kossuth, appealed to the Clerical Independents to cease their obstructive opposition, and asked the Premier if he would withdraw the guillotine amendment if the contingent of recruits for 1903 be voted without delay. This Count Tisza consented to do. The Army bill for 1903 was then passed, and deficiency appropriations were made to cover unauthorized expenditures of the Government for the period from May, 1903, to date. Neither of the former Premiers, Count Khuen Hedervary nor Mr. de Szele, was able to accomplish the task of legislation in the face of a determined and obstreperous minority, and the Independence party have secured many concessions by means of their dilatory tactics.

The Russo-Japanese War

The Russian and Japanese troops have not yet come in contact with each other on the Yalu River, altho there are occasional skirmishes between the outposts in Northern Korea. Several parties of Russians are reported to have crossed into Korea, but it is believed that the main body of the troops will remain on the Manchurian side of the Yalu and await the Japanese there. The Japanese front is still at Ping-Yang on the west and Wonsan on the east, probably waiting the completion of transportation facilities with Seoul and the ports, and advent of warmer weather to enable military operations to be carried on in mountainous and forested regions to the north. No important movement on the part of the Russians is to be expected until the arrival of General Kuropatkin at Mukden the last of this week.—On March 15th the Vladivostok squadron made its way out of that port by blasting a channel through the ice with dynamite. Its destination is unknown, but it is supposed, of course, that the attempt will be made to join with the Port Arthur fleet. This will be a very difficult thing to do, because the strait between Korea and Japan is now in Japanese control, and Port Arthur is still picketed by part at least of Admiral Togo's fleet. The Russian fleet under Admiral Makaroff left Port Arthur on March 11th, supposedly to meet the cruisers from Vladivostok, but, meeting the Japanese fleet two days later, it returned to the port. The Vladivostok fleet consists of four fast cruisers and one transport, with perhaps the addition of two of the volunteer fleet. It is in command of Captain Reitzenstein, who has taken the place of Admiral Stackelberg, retired on account of illness. Admiral Stackelberg was in command of the squadron when it visited Northern Japan, February 9th to 15th, and he denies having fired upon unarmed merchant vessels in Tsugaru Straits, between the islands of Yezo and Hondo. He says one was sunk after taking off the crew and passengers and the other turned loose for the purpose of spreading the alarm.—The Russian cruiser "Variag," which after its brave sortie in the face of the Japanese fleet was sunk in the harbor of Chemulpo, has been raised by Japanese wreckers and will be repaired in the course of a few months. Several Japanese vessels have been injured in the Port Arthur fights and taken to Sasebo for repair, but the extent of the damage to this fleet is carefully concealed.—Attention is now directed to the western boundary of Manchuria, where the probability of an attack

from Chinese and possibly Japanese forces is increasing. General Tin-Cheng has 8,000 men at Bodune, 100 miles west of Harbin; General Ma has 10,000 at Kau-pan-tze, and there are several thousand more at Sin-min-tun and other points. The Chinese officials in Manchuria are said to be decidedly hostile and are interfering with the purchase of supplies. The Chinese show no disposition to obey the Russian demand that they keep to the south of the Great Wall, notwithstanding the threat of an attack on Pekin if they failed to comply. Viceroy Alexeieff has defined the western boundary of military operations in Manchuria as follows: The line of the Mongolian frontier to its intersection by the Liao River, thence to Sin-min-tun, thence along the railroad to Koupangtze, thence along the railroad to the coast at Ying-Kow (Niuchwang). It is feared by the Russians that the Japanese will land to the west of the Liao River and join forces with the Chinese for an attack on Manchuria from the west. Niuchwang is being fortified, troops to the number of 20,000 are stationed there and are drilling constantly, the foreigners in the town are not allowed to approach the railroad nor to go beyond the mud walls of the native city, except to the British and American gunboats, which are soon to be withdrawn from the port where they have been in winter quarters. The Liao River is now navigable.—The special session of the Japanese Parliament was opened March 20th by a speech from the Emperor delivered in person. There will be no opposition to the additional taxes necessary for carrying on the war, altho the proposal to make tobacco and salt manufacture Government monopolies may be opposed.

The Real Japanese Character

BY COLGATE BAKER

[Mr. Baker contributed the illuminating article we printed a few issues ago, entitled "Some Considerations of the Far Eastern Question." It will be remembered that he was born in Japan and lived there many years, and even speaks fluently the Japanese language.—EDITOR.]

NOW that Japan is fighting for supremacy in the Orient with every promise of success, the real character of these Martians of the Far East becomes a subject over which the people of the United States should gravely ponder. It is possible that this country, in conjunction with other world Powers, may be called upon to say how far Japan may be permitted to go in her victorious march toward complete ascendancy in Eastern Asia, and in this connection it is certainly worth while for Americans to consider the character of the Japanese.

To the American public the real Japanese character is a sealed book. The people of this country base their estimate of the Japanese on their achievements in all lines of progress, in the arts of war and peace, in science, industry and commerce; but American ideas of Japanese character are derived from the highly colored works of fiction written by over-enthusiastic travelers and by observation of the clever, tactful natives of Japan who reside in the United States.

The excessive politeness, the charm of manner, the refinement and astute diplomacy which the Japanese display in all their social intercourse with foreigners have won for them a host of eulogists. The enraptured globe trotter who spends a few months in Japan invariably writes a book when he reaches home replete with fulsome adulation for Japan and her people, which is immediately placed on the shelf with the authorities. It is the fashion to sing the praises of the Japanese just now, and attempts to do otherwise are frowned down. In fact, it has always been thus, and this is one of the reasons why the few people who do understand the Japanese and are entitled to speak with authority have said little or nothing.

There are some white men in Japan who could tell startling things about the Japanese if they chose to. Some of these men have become Japanese, politically, socially and morally—so enthusiastically, in fact, that they actually regret their inability to change the color of their skins. Of course, they can only say what is complimentary and pleasant to the natives of their adopted country. Perhaps they are afraid to tell what they know of the real Japanese character, perhaps they are ashamed—if they have any sense of shame left—and perhaps they consider it quite useless to try to enlighten the Western mind concerning this dangerous subject.

Lafcadio Hearn exploits in his fascinating writings all the charming traits in the Japanese character, but he is blind to the ugly side of it, for his viewpoint is that of a Japanese. If he ever wakes from his trance and becomes a white man again he can tell the world something of far more importance about the Japanese than pleasant fairy tales and vague rhapsodies.

To those who have lived long among the Japanese and have studied them closely the most striking element in the Japanese character is an inherent philosophy which seems to be a natural quality of the Japanese mind. This remarkable characteristic is evidenced in every man, woman and child, one observes. Whether this peculiar inherited philosophy should be termed an element of character or merely a mental quality is immaterial; its influence on the Japanese character, which it absolutely dominates, is unquestioned.

Foreigners marvel that Japanese can bear great personal sorrow, loss of fortune, disease, and reverses of all kinds with comparative composure, and conclude that for this reason the Japanese has more fortitude than the Caucasian, or less feeling. As a matter of fact the Japanese does not allow himself to feel the sorrow that a Caucasian must inevitably experience on such occasions, and

he is therefore able to meet the crisis with a calmness and power which gives him a great advantage over the Caucasian.

At the funeral of some dearly beloved one in Japan the weeping is done by hired mourners, and when the obsequies are over the bereaved family and friends feast, drink and make merry at a nearby tea-house. It is the Japanese philosophy that since we must live, we should live as happily as we can, therefore there is no sense in feeling sorrowful, as what has happened is over and done with and grief is folly. The spectacle of a Caucasian smitten with grief is ridiculous to the Japanese mind, but the Japanese is too tactful to express his sentiments on the subject to a foreigner.

The stoicism of the samurai, the fortitude of the Japanese soldier and sailor to-day is largely due to this inborn philosophy, which has also contributed to the remarkable success of the Japanese in many modern professions and industrial and commercial pursuits. For practical purposes it is undeniably a great advantage to possess this absolute control of the feelings or power of self-hypnotism. Herein lies the secret of the adaptability of the Japanese to all sorts of conditions of life and the power which they possess of pursuing their chosen careers unswervingly and relentlessly to the goal which they seek to attain.

That the Japanese are frugal, patient, industrious and calculating everybody well knows, but the possession of these qualities does not account for the wonderful progress which they have made in modern science, art and industry. The Chinese possess all those qualities as well as the Japanese, and so do the people of other Oriental countries which Japan has left far behind in the march of progress. The Japanese are quick-witted and alert to an astonishing degree, considering they are Asiatics, and these qualities have most elicited American admiration; yet without that inborn philosophy of life the Japanese never would have attained to the position which they now occupy in the world's affairs.

The leprous spot in the Japanese character is the moral element, which is absolutely dominated by this inborn philosophy.

It has been stated that the Japanese have no morals, but this is quite untrue. They have no moral ideals, so cherished by Western civilization. The beauty of the moral principle—right for right's sake—is quite incomprehensible to the Japanese mind. In the Japanese philosophy it is right to do anything which is wise, and wrong to do anything which is foolish; beyond this there is no right or wrong, good or bad.

In business the Japanese is honest when honesty is the best policy, and dishonest whenever it seems advisable. The merchant who does not take advantage of an opportunity to cheat by giving short weight or substituting an inferior quality of goods considers himself a fool. The man who does not break his plighted word if it is advantageous for him to do so is stricken by his philosophic conscience.

I do not think that there is a foreigner doing business in Japan who will not bear testimony to these facts, which are freely admitted by the Japanese among themselves, altho they will be indignantly denied as a matter of policy by Japanese abroad. American and European business houses importing goods from Japan do not dare to import from Japanese merchants, and for this reason the export trade of Japan will largely remain in the hands of foreign houses. Japanese firms here and in Europe import from native firms in Japan, but in most cases the importing house is only an agency of the home firm, as the Japanese merchants know each other too well to trust each other. Orders from Japanese firms for American and European goods are generally sent through the medium of some foreign firm in Japan, which assumes the responsibility of payment whether the Japanese customer takes the goods or not, and if the market has fallen while the goods are in transit so he can buy cheaper on the spot, the Japanese merchant does not hesitate to repudiate his order. These facts are well known in Japan and among merchants in this country and Europe who do business with Japan.

Foreign firms doing business in Japan have always experienced the greatest difficulty in preventing their Japanese employees from defrauding them by secretly exacting a commission from the native merchants with whom they transact busi-

ness. It is a matter of common knowledge that the native "bantos" or head men of the oldest foreign firms have enriched themselves by the fraudulent practice of charging a secret commission or "kosen" in all dealings with native merchants. Many of these "bantos" have amassed millions by their dishonest methods, and the business of the foreign firms that employed them has practically passed into their hands, the foreign partners in those firms being mere salaried employees of the Japanese "banto." It is a fact that this is the condition of one of the principal American export houses in Japan to-day. Dishonest collusion between the native merchant and the "banto" to obtain higher prices from the foreign buyer has made it impossible to break up this system and has wrecked many a foreign firm in Japan.

To the Japanese mind personal chastity is a matter of no importance except in the wife and mother. This attitude is consistent with the inborn philosophy that dominates the Japanese character. The interests of the home and posterity make it necessary that the wife should be virtuous, and in justice to the Japanese wife it must be said that she is a model of virtue. If the husband can find happiness in being a libertine, or in keeping a number of concubines, it is considered right for him to do so. It is only when the husband squanders more than he can afford in riotous living that he is considered to be doing wrong. The principle upon which a libertine husband is condemned in Japan is purely a material one and not a moral one. A young girl may be bonded to a brothel, a geisha company, or placed as a concubine by her family, if financial reasons make it advisable, and to the Japanese mind it is perfectly proper. The Buddhist doctrine of self-sacrifice upholds the girl who sells herself for the sake of her parents, and altho she becomes for the time being an outcast from society, she is esteemed for her act. It often happens that a well-to-do Japanese man buys a girl out of the Yoshiwara, and if she becomes his wife she finds no difficulty in establishing herself in society.

Suicide has always been considered honorable in Japan, the wish to die being considered sufficient justification for the act. No moral principle against suicide is apparent to the Japanese mind. In past generations the samurai code prescribed suicide if it was impossible to live with honor. The passing of the samurai has not witnessed the elimination of his fantastic theories concerning suicide in Japan. The cause of suicide in Japan is almost invariably dishonor.

The religious element in the Japanese character is strong in the women, but the men are materialists, pure and simple. The women are the temple-goers. Buddhism and Shintoism have taught the women the beauty of self-sacrifice, which is the keynote of their character. The religion of the women has created a state of affairs in the Japanese home which is most agreeable to the lord and master, man. The wife finds delight in being her husband's slave and exaltation in her self-immolation. She seems to always have in mind the saying of the blessed Buddha, "Only through self-sacrifice shall you enter into heaven."

The character of the Japanese people as a whole has not been affected by Christianity. The number of Christian converts is insignificant in comparison with the population of Japan, and the influence of those converts on the national character is not apparent. The average Japanese looks upon the efforts of the Christian missionary in his country with a kindly spirit. He is well aware that the progress of Christianity in Japan is not sufficiently rapid to endanger any of his social institutions for generations to come, at least, and he is also fully convinced that his own philosophy of life is infinitely superior to Christian doctrine. The young Japanese who becomes a convert to Christianity while studying abroad sometimes meets with kindly indulgence when he returns to his family in Japan, but more often with mild ridicule, particularly from a Buddhist mother. As a rule, the young man lets his Christianity lapse and soon becomes merely a materialistic Japanese.

The Japanese nation has assimilated everything in Christian civilization except the Christian religion and its standard of morality. To-day Japan is equipped to hold its own in warfare, in science, in industry, art and commerce with any nation in the world, but it does not accept Christianity because it considers the Japanese philosophy superior.

To the Japanese mind there is no sin but folly, no ideals to be realized but material and patriotic ones.

By clever diplomacy Japan has engaged the sympathy of the Anglo-Saxon people in her war against Russia for the dominion of the Far East, and it is proclaimed that she is fighting the battle of Western civilization.

It must be admitted that Japan appears to stand for the material interests of our civilization, but she does not and she never will stand for Christian ideals.

It is my conviction that the Japanese character is the most insidious force that has ever menaced Christianity. The Japanese philosophy is diametrically opposed to Christian principles on all cardinal points. It is a philosophy which completely possesses those who believe in it, with a power almost hypnotic. One has only to observe the white men who have become Japanese to see how it wrecks the moral character of the Caucasian.

The effect of the Japanese philosophy on the brain of the European or American is not unlike that of a subtle narcotic. It perverts all moral ideas and poisons the very source of every thought and action. To the white man who falls under the sway of this mystic power Christian civilization, with its ideals, appears ridiculously Quixotic. He has nothing but contempt for the men of his own race and is even ashamed of the color of his skin. It only natural that such an individual should forsake his own kind, don a kimono, become a Japanese, and try to lose himself in the great yellow mass.

While sojourning in a small city on the Inland Sea, far from the beaten tracks of tourists, I was surprised to hear that a white man had come to the place with a troupe of Japanese actors and was to give a performance at a local theater. Out of curiosity I witnessed the performance of this man and subsequently invited him to dine with me. As I expected, the fellow, who called himself Yensaburo Black, was completely possessed by the Japanese philosophy. He was an Englishman, educated at Harrow, and his father, happily deceased, had been one of the pioneer newspaper editors of Japan. He preferred to converse with me in Japanese, rather than in his own mother tongue. Of course, he spoke enthusiastically of the Japanese life. He declared that he was supremely happy. It was painful for him to meet foreigners, he said, because they did not understand Japanese life and ideas, and because they reminded him of the contemptible Christian civilization he wished to forget. He assured me that before he had accepted my invitation he had inquired whether I could speak Japanese and would entertain him in Japanese style, and had he not been satisfied on those points by the tea-house people he would have stayed away. This man refused to touch the foreign dishes placed before him, explaining that he could only eat Japanese food.

What the Japanese philosophy has done for Mr. Yensaburo Black it has done for others of stronger mind, greater abilities and more distinguished position.

There is no mystery about the Japanese character, as Sir Edwin Arnold, Mr. Lafcadio Hearn and others would have us believe, but there is an absolute lack of what the Christian world understands and cherishes as moral ideas. The inherent natural philosophy of the Japanese mind does not permit it to conceive those ideals, and, while it cannot be gainsaid that there are many admirable traits in the Japanese character, all of them together do not counterbalance the absence of true moral principle.

While the sympathies of the United States are necessarily with Japan in her present struggle with Russia, is it not wise for the people of this country to consider the character of the people to whom they have given their sympathies, and to what extent they can afford to let these sympathies carry them?

It would be an injustice in any discussion of the Japanese character not to pay a tribute to the exquisite esthetic sensibility of the Japanese of all classes of society to beauty in nature and in works of art. This is one of the most charming and distinctive character traits common to the Japanese. The foreigner visiting Japan is surprised and delighted to find that even the coolie toiling on the Yokohama docks and the humble jinricksha man are competent and enthusiastic art critics. The high development of the poetic and artistic sense of the Japanese in no way affects the moral side of his character.

New York City.

The Secret of Russia's Friendship

BY WHARTON BARKER

[Mr. Barker was the Presidential nominee in 1900 of the Anti-Fusion Populists, and for many years has been one of Pennsylvania's most famous sons. In connection with the following article it is only necessary to recall that he was the American representative of Baring Brothers, the London bankers, and in 1878 the financial agent in the United States of the Russian Government and intrusted with the building of four cruisers for its navy; that he was made Knight of St. Stanislaus by Alexander II, and later was called to Russia to advise in regard to the development of the coal mines north of the Azof.—EDITOR.]

THE oldest, the most changeless, the most apparent, and yet the least comprehended, is the policy of Russia. Russian friendship for the United States, a marvel of history, has remained—still remains—the mystery of diplomacy. Accepted because it is the conspicuous fact, its solution has been abandoned, while its endurance has been most amazingly presumed upon. How long the rough awakening would have been delayed, were it the policy of any Government other than immutable Russia, Manchuria and the "open door" of China would long since have disclosed. But Russia's statecraft is not of the months or of the years; it is of the ages. It is not of monarchs, but of a dynasty; and it is less the policy of the dynasty than it is the need of a people and of a land.

To only one American, I believe, has the secret of Russian friendship for this country ever been explained. The explanation was made by the Emperor, Alexander II, fully, carefully, and with so much explicitness that its purpose was not to be misunderstood. I have refrained from the performance of the duty, which was imposed upon me by the conferring of the Emperor's confidence, for nearly twenty-five years, until now; the time had not come when the events which he divined might be considered imminent, and the hour for the disclosure had not unmistakably arrived. The time, I believe, is at hand; and I make public, in complete detail, all the pregnant considerations of policy which were intrusted to my discretion, together with such intimate details of His Majesty's reflections upon the condition of his Empire and upon the future domestic condition of the United States as will evidence the profound, the unerring premises of foreknowledge whereon the policy of Russia toward the United States has been based. I do so with a full appreciation of the grave consequences which may and, indeed, should attend a disclosure of such immediate and far reaching importance.

On Sunday morning, August 17th, 1879, I was breakfast guest of the Grand Duke Constantine at his Pavlovski Palace. The talk, enduring for two hours at the table and in the library, covered many small subjects of public and private interest; but nothing of real and permanent value was said. Had I not enjoyed intimate and confidential relations with many persons high in official and social rank at St. Petersburg, the invitation of the Grand Duke would have made a deep impression upon me; but, as I had been his guest several times before, and had been, as well, the guest of many others at the Court of Alexander II, I thought the morning's entertainment was no more significant than any other social compliment.

I was in Russia that year upon invitation of the Grand Duke Constantine and Prince Sergius Dolgorouki, for conference with them and with the Ministers of Finance, Ways of Communication and Public Domain, as to large and important railroads, coal, iron and steel enterprises about to be undertaken in the South of Russia. During the preceding year I was financial agent in America of the Russian Government, and, with Captain Semetschkin, directed the building of the cruisers "Europe," "Asia," "Africa" and "Zabiaca," for Captains Grippenburg, Avalon, Alexieff and Loman, at Cramp's shipyard. These captains, and many of the subordinate offi-

cers, were superior men. Semetschkin and Loman are dead; Grippenburg is now a retired Rear-Admiral; Avalon is now Vice-Admiral and Chief of Staff of the Russian Navy, and Alexieff is Viceroy of the Asiatic provinces of the Far East.

I was about to take my leave of the Grand Duke, when my host said:

"Wait a few minutes and you will see I called you here this morning for a purpose."

Soon the lodge bell was rung; and the Grand Duke, summoning me to a window opening on the courtyard, said:

"You will now understand why you are here. The Emperor is coming; he wishes to talk with you in a somewhat informal way—a way in which he could not talk if you were presented to him at formal audience by the United States Minister. I will present you to His Majesty in about half an hour."

The Grand Duke left me at the window and went to meet his brother at the door step. With no escort of servants, no body guard of armed men, the Emperor, mounted on a brown horse, came into the yard. He had not come alone from Tzarskoe, Selo. He was followed by a one-horse phaeton, in which were two ladies—the Empress of Russia and the Queen of Greece, daughters of the Grand Duke Constantine. There was no pomp, no display—nothing to mark the distinction of the little party of great people who had driven through the park that summer morning. It was really a unique and most interesting beginning to an important interview.

A brief description of the room in which this portentous talk with the Emperor, Alexander II, took place, will increase the interest of the interview, for it marks the Oriental mind, to be found only in Russia and in China. The Oriental loves the beautiful, more, I believe, than does the Italian. He waits with patience the opportunity that brings about the accomplishment of his plans and hopes; and he knows, better than the men of the Western world, how to absorb and use individual men as well as nations.

The audience room in the Pavlovski Palace was in dimensions about sixty by forty feet; the ceiling was fully twenty feet high; large windows on each side overlooked the terrace and afforded a view of the park. The other side and both ends, decorated with large mirrors, were finished in white paint and gold. The furniture was gold, with rich tapestry covering. The floor was rather cold, for there were no rugs. Such were the normal conditions the architect and the artist had produced; but, for the interview, the Grand Duke added a beautiful bank of rose bushes, in full bloom—tea roses all. About one-quarter of the space was filled with roses in pots from the greenhouses, the blooms forming a crescent in one corner of the room.

In front of the bank of roses the Emperor received me, on his right hand the Grand Duke Constantine, on his left hand the Empress and the Grand Duchess. To one side and, of course, apart from the Imperial group, stood my friend Semetschkin.

On entering, I was presented, without any formality or delay, to the Emperor by the Grand Duke, as "Mr. Barker, your Majesty's American banker."

The Emperor's first remark was incisively inquiring:

"Mr. Barker, is your American system of banking, in your judgment, adapted to the needs of Russia?"

There was then, for a few minutes, a general talk on economic and financial questions that satisfied me the Emperor had been a student of those questions, as, later, I was sure he had given much attention to the great questions that pressed upon his own country and upon other countries as well. He spoke at some length of the plans of his Minister of Finance—comprehensive plans, plans which later, in 1890, played a very important part in European affairs. He spoke of the liberation of his serfs; of his efforts to educate them; of how and why those efforts had largely failed. He referred with earnestness to the conditions he met in the course of discussions with the land owners; of how he went through the provinces, appealing to the conciliatory spirit and the devotion of his nobility, reprimanding those who hung back, reminding them that reforms come better from above than from below. He even disclosed frankly the manner in which he had packed the Imperial Commission with men devoted to the principles of emancipation. The Commission declared

for the immediate abolition of serfdom and urged the most effectual measures to prevent the re-establishment of the seignorial authority under other forms; and it decided, also, that the peasant should become a proprietor on the payment of an indemnity. It is important to remember that the manifesto of March 3d, 1861, declared these fundamental principles. The peasants were to be invested with all the rights of free cultivators of the soil. In consideration of certain quit-rents, they were to obtain full enjoyment of their inclosures and also a quantity of arable land. More than nine acres of land were given to every male peasant. The Government made loans, so that the peasants could immediately liberate themselves from their lords, yet remain debtors to the state. More than one-half the land was thus taken from the lord and given to the peasant. It should not be forgotten that the Russian peasants owe their liberty to the firm will of the Emperor, and to the generous efforts of his brother, the Grand Duke Constantine.

"I did more for the Russian serf," observed the Emperor, "in giving him land as well as personal liberty, than America did for the negro slave set free by the proclamation of President Lincoln. I am at a loss to understand how you Americans could have been so blind as to leave the negro slave without tools to work out his salvation. In giving him personal liberty, you gave him an obligation to perform to the state which he must be unable to fulfill. Without property of any kind he cannot educate himself and his children. I believe the time must come when many will question the manner of American emancipation of the negro slaves in 1863. The vote, in the hands of an ignorant man, without either property or self respect, will be used to the damage of the people at large; for the rich man, without honor or any kind of patriotism, will purchase it, and with it swamp the rights of a free people."

All this makes clear the keen appreciation the Emperor Alexander had of what he had done for his serfs—and of what Americans had done for the negro slaves. The hopes and dreams of the Emperor Alexander, and of the great men who helped him free the Russian serfs, and the hopes and expectations of Lincoln, Garrison and the thousands of Americans who gave their lives and fortunes to the cause of negro emancipation, have not been realized. But the fears of Alexander have been realized. The Emperor was right in thinking the solution of the negro slave question would debauch our people and bring serious trouble to America. But, as I reflect upon what he said regarding the clash of classes in Russia and in other European countries, and upon the same conflict in America between the "House of Have" and the "House of Have Not," I am led to wonder at the grasp of the great man I talked with so long ago at St. Petersburg. Even more prescient was his forecast of the American industrial conditions of to-day.

"Your great industrial development," he continued, "has built up very large fortunes in few hands; and the conditions such fortunes produce must bring on a class conflict that cannot fail to make a test of the stability of your institutions. The men who have those fortunes know only the law of greed; they have no respect for the rights of others; and they will surely make an effort to use the strong arm of government to enslave the people. They will use the public franchises you grant in so liberal, so dangerous a way, to tax the people. These men of large fortunes will organize into groups to increase their power, and their aggressions will as surely drive the body of your people to the enactment of laws which may be most hurtful to the general prosperity. I see a great conflict must soon come in America between the few who have vast fortunes and the many reduced to a kind of industrial slavery."

If conditions in America in 1879 brought such reflections to a Russian Emperor, what must be the reflections of Europeans of to-day, who are as serious, as earnest and as capable as Alexander II? If the Emperor had dismissed me after these remarks, I could never forget the 1879 August Sunday at Pavlovski; but I was to hear a chapter of world history that should be put in permanent form by me; for I do not believe the chapter was ever spoken or written for another by Alexander. Without knowledge of this chapter, many very great

events cannot be understood. Of those present at this remarkable interview, only the Emperor and I spoke. Of course, and I believe, fortunately, my part in the conversation was small. The circumstances under which the interview proceeded moved Alexander to speak in earnest, aggressive, but sad tones. It was apparent to me that he had lived for a long time in intellectual loneliness; that he scarcely knew what fair and open criticism of his acts was; that he believed those about him and near to him did not, and probably could not, appreciate the major purposes and acts of his life—that he believed he must always act for himself and for Russia; that the responsibility of the Russian Empire rested upon him alone, and not upon him and his Ministers and Council of State.

"In the autumn of 1862," observed the Emperor, "the Governments of France and Great Britain proposed to Russia, in a formal, but not in an official way, the joint recognition by European Powers of the independence of the Confederate States of America. My immediate answer was: 'I will not co-operate in such action; and I will not acquiesce. On the contrary, I shall accept the recognition of the independence of the Confederate States by France and Great Britain as a *casus belli* for Russia. And, in order that the Governments of France and Great Britain may understand that this is no idle threat, I will send a Pacific fleet to San Francisco and an Atlantic fleet to New York.' Sealed orders to both Admirals were given."

After a pause, he proceeded:

"My fleets arrived at the American ports; there was no recognition of the independence of the Confederate States by Great Britain and France. The American rebellion was put down, and the great American Republic continues.

"All this I did because of love for my own dear Russia, rather than for love of the American Republic. I acted thus because I understood that Russia would have a more serious task to perform if the American Republic, with advanced industrial development, were broken up and Great Britain should be left in control of most branches of modern industrial development.

"In 1864 I was silent as to what the course of Russia would be, should Great Britain and France support Denmark in the war waged upon her by Prussia and Austria over the Schleswig-Holstein question. The result was that France did nothing; and Great Britain, altho anxious to preserve the territorial integrity of Denmark, confined her efforts, as in the case of Poland shortly before, to the limit of mere diplomatic intervention. The plans of Bismarck were advanced—Schleswig-Holstein became a German province.

"In 1866, when Bismarck sought, together with Prussia, Hanover, Hessen-Cassel, Nassau and Frankfurt, to establish the North German Confederation and to exclude Austria from the German Confederation, I was silent as to what the action of Russia would be should France support Austria in the pending war. Because of this silence, France hesitated to act until it was too late, and the dreams and ambitions of Bismarck were realized. My purpose was the establishment of a European balance of power that would be a menace to Great Britain."

The Emperor again paused for a moment, to see, I think, what effect he was making upon me. I remained silent and expectant. He spoke once more, and said:

"To complete German unity, and to enable German manufacturers to strike at British industrial and commercial supremacy, it was plain the plan of Bismarck, for despoiling France of Alsace and Lorraine, must not be hindered. Therefore when, in 1870, the French-German war opened, I let it be understood that assistance to France from Austria or Great Britain would be followed by Russian support of Germany. Therefore, the war was fought out between France and Germany; and the German Empire was established and proclaimed. My support of Germany in these three wars was because my Russia would profit.

"When the French people had paid the indemnity to Germany, and the Republic of France grew strong, there was alarm at Berlin; and Bismarck would have sought quarrel with France but for my attitude. The French-Russian understanding has preserved peace in Europe.

The course of Russia is clear and her destiny can be fulfilled. Russia stands for peace."

In conclusion, the Emperor said:

"I have believed these acts were great acts, because they were right. But they are not appreciated as righteous acts by those near me; and those far off and outside of Russia look upon me as selfish."

The Emperor and the Imperial party left the room; the audience was over. I went back to St. Petersburg almost immediately after their departure.

The following day, August 18th, 1879, I was guest of honor on a steam yacht, one of three in line near the Nicholas Bridge. The Emperor and his staff were on the largest one; the Grand Duke Constantine and the Naval Staff on the second; and Captain and Madame Semetschkin and I on the third. In tow of the Imperial yacht was a small boat, the men holding oars at rest, ready to cut the tow line, drop oars into the water, and pull wherever directed, should any accident befall the Imperial yacht. The gunwales of the boat were covered with purple and gold cloth, to add to the magnificence of the pageant. The day was cloudy; there was no movement of pleasure boats on the Neva; there was no incident of special interest until we came to Cronstadt, seventeen miles distant from St. Petersburg.

The harbor of Cronstadt was an impressive picture. The Russian Baltic Squadron was drawn up in double line. The place of honor between those lines was occupied by the small United States cruiser "Enterprise." Immediately upon the arrival of the yacht fleet, the Emperor opened the review. As he went from one ship to another, the crews manned the yards, the bands played, and guns were fired, in his honor. But the day was still cloudy.

When the Emperor had gone on board all his own ships, the climax came. He went to the tiny "Enterprise." As he was received on the quarter deck, at a signal gun from the Imperial yacht the American flag was run to the masthead of all the Russian war ships at Cronstadt, and a gun salute was fired from all the ships together, in honor of our country and our flag. As the smoke rolled away the clouds broke, and the bright sun shone upon the American flag with a new and splendid glory.

Russia had not forgotten properly to honor the flag Russian fleets had upheld at New York and San Francisco in 1863; and those American citizens who were at Cronstadt on that day appreciated what Russian friendship for America had been, and then was.

Americans cannot forget either the Russell-Palmerston-Louis Napoleon proposal, or the Alexander answer of 1862-1863. They remember that they owe almost as much to Russian action in 1863 as they do to French action in 1778. But if they will give due thought to the words of the Emperor Alexander II, they will do what is more vital in the shaping of the destinies of a nation. They will understand.

PHILADELPHIA, PA.

Barriers

BY ARTHUR CHAMBERLAIN

HEDGEROWS about the land,
And fence and barrier-wall;
Beyond the shining strand
The sea is free to all.

Hedgerows about our life;
A narrow way, ah, me!
Beyond this mortal strife
Stretches eternity.

SALEM, MASS.

On Giving Up the Ministry

BY HENRY A. STIMSON, D.D.

[The following article by the pastor of the Manhattan Congregational Church, of this city, is in comment on the article by the young minister, entitled "Why I Gave Up the Ministry," which we printed two weeks ago. We are sorry that we are unable to print half a dozen more valuable articles on this subject from the large number we have already received since the first article was written. It is interesting to add that fully as many of these articles agree with the anonymous young minister as with Dr. Stimson.—EDITOR.]

A CURIOUS interest seems to attach to a minister's giving up his profession, or even changing from one denomination to another; the principal party attaches public importance to it, and the public shows some response. It may be regarded as testimony to the dignity of the calling, or at least to an inherited dignity which has not altogether passed away. But when a minister comes to give reasons for his change he drops into the condition of other men giving reasons for their personal conduct. The reasons have not much value; they are hard to determine, may be unworthy, are sure to be inaccurate, and, in any case, are of far less importance than is generally claimed. If there is a "tragedy," it is in the act, and not in the reasons. When recently a prominent pastor gave up his charge to accept a college professorship, and took occasion to say in the most public way that it must not be thought he was laying down his special service, he was simply "going up higher," the friends who loved him most were deeply grieved, and the public was conscious of a distinct shock.

Some fifty years ago the late Dr. James Martineau wrote an article upon the condition of the ministry at that time. The especial burden then was the doctrinal discussion with which they were beset, or, as he put it, the weight of dogma they were expected to carry and their official responsibility for hunting out heresy. Fortunately to-day that does not seem to be the peculiar burden. When he reports that even in the face of those difficulties it was to be doubted "whether the hearts of Englishmen were ever more prepared for being drawn together by common sentiments of reverence, conscience and aspiration," there is reason to hope that tho the difficulties which beset the minister have changed, the grounds for hopefulness to-day are not less distinct.

When, however, a minister demitting his profession "lays it to the charge of every man in the ministry to-day that he is in much the same condition," the situation changes, especially as his own condition is described as a deepening desire to help men and a growing indistinctness and vagueness in knowing how to do it. His conception of the Roman Catholic clergy hardly helps matters. We may set over against his idea that they still know what to do and how to do it the assertion of Dr. Martineau that "while uncommon duties and powers are provided for and pursued by a priesthood, in spite of Anglican attempts, sacerdotal mediation has vanished from modern Christendom." However comfortable and assured the position of a Catholic priest may appear to an outsider, the ills of Protestantism, whether in the clergy or in the laity, are certainly not to be cured by an appeal to them.

It is rather pathetic to have a retiring minister advance, even as a minor reason for his act, his revulsion toward his fellow ministers because of their social position or individual deficiencies. Our Lord seems to have chosen plain men from preference. If his disciples ever became distinguished it certainly could not have been anticipated from anything in their native endowments, or in their rank in society. From any human standpoint the material of the ministry is at least as promising to-day. I recall that there were seven valedictorians of different colleges in my single class of thirty-six men at the seminary—men in every way of notable powers and attainment. But it is long enough since we graduated to permit the Church to discover that

there were many most useful and most companionable men among the remaining twenty-nine. To feel revulsion from such men, not because they are not devoted servants of the Lord, patiently and contentedly doing his work, but because perchance there are more notable and more brilliant men in other walks of life, would suggest the need of a more careful examination of one's own heart. Even so great a man as Oliver Cromwell "endured fools gladly."

It is a relief to observe that the seeming not far from dishonesty, which is advanced as the second minor reason for discontent, does not relate to intellectual dishonesty, of which of late years we have heard so much in accusation of the ministry. When a man feels some unworthiness for his position, he is to be congratulated upon it. When he thinks that men in other occupations may be more useful, it is a question of individual judgment and of personal taste. When he regards his life as less normal than that of others because he feels the restraints of his profession and finds himself less free to indulge in the pleasures of life than his former companions, he needs to be reminded that every man must pay the price of position. He cannot have the privileges without the corresponding obligations. It has been regarded as the glory of the ministry that many things which other men do can be cheerfully given up for the access of opportunity and of power which comes as a consequence.

It is hard to know just what answer to make to a man whose fault with the minister's life to-day lies in the fact that he has too much to do in outside affairs, in connection with philanthropic institutions and matters of general benefit; that he has "to see a thousand people" about "everything under the sun" that may be of interest to them, where "only six" come to see him about their souls. One should think he might be thankful for six who of their own impulse came to open their hearts. Any minister's experience would correspond to that, but it would also tell him that there would be sixty, and, at times, six hundred, who would gratefully respond to his coming to talk to them about their spiritual needs.

If I may be pardoned a personal reference, I left business for the ministry also, not from ill health, or because of failure, nor for money, nor because of "a woman in the case;" and since then have been called to do, in my profession, a good deal of hewing of wood and drawing of water, never more perhaps than to-day. But I am not thinking of going back to business for relief. In fact, I long ago learned that a minister is not exempt from other men's chores, and, indeed, may find blessing in them. Nor even if left to himself is he likely to devise ways of helping men any better than in doing for them what they bring to him as from their point of view the thing they most need to have done. It is very distracting if one is composing either a sermon or a poem, or even an editorial, to have men come who are in need of a job, or a little money, or counsel, or "influence." But, then, if you really want to help men, that seems to be the help that they want. There is nothing "unique," it is true, in being helpful to men. But there is a "calling" in it, when a man gives his life to it in the spirit of his Master and for his sake.

The two important things about a minister, from the standpoint of the Church and of the world, are the Man and the Message. Consciously or unconsciously the world looks to see whether he is unselfish, kindly, sincere and devoted. The best evidence of this is his daily helpfulness in things that are easily understood—not the things that he chooses to make the expression of himself, but the things which the world is accustomed to select as giving it its familiar if not its best means of judgment. If his message also is not from a heart to hearts, it is of small consequence to anybody but himself. A minister cannot live as a recluse and speak to the hearts of his people. He must know them that he may know what to say to them; and he would be a singular man who could know his people and not be willing to give all the time that is necessary to helping them in their circumstances of manifest need. Of course there have been times when great men came out of seclusion to deliver a great message; but Tauler and Savonarola and John Calvin, and men of their like, tho they lived apart, showed to all men that they took the whole people upon their hearts, and if not burdened with

the weight of the care of individuals, carried a tremendous burden in their care for the community as a whole.

It is hard to see how any man can do the work of the ministry who is impatient of daily troubles and constant interruption. Undoubtedly, we are set to promote spiritual life, but many people about us do not want spiritual life, or know nothing about it. If they are to be reached at all, they must be reached through their recognized wants. Only when that is done are their hearts open to the discovery of deeper needs, and to a hungering and thirsting for the supply of them. Why, then, be impatient? The Church and the ministry have been at this task from the beginning. They will probably continue at it as long as human need exists and human souls have to face the temptations and the sin that pertain to human life. Our Lord washed his disciples' feet, I fancy not so much because their feet at that hour needed washing as that they might be taught the lesson of humility in the presence of the humblest service. He told the disciples of John to carry word to their leader that "the blind receive their sight, the lame walk, the lepers are cleansed, the deaf hear and the dead are raised up." And perhaps because of this and by means of this it was true that "the poor had the Gospel preached to them." Why, then, be disheartened? Why run away from such service? Why make a "tragedy?" Would it not be better to gird ourselves with a towel? Every earnest man has his time of impatience and weariness. We all need to be reminded that a different occupation does not really change the conditions of life or of service. "Who cross the sea change clime, not mind." Before any man leaves the ministry or allows himself to believe that all his friends are eager to do the same, or are equally perplexed to know how to meet their daily tasks, it might be well to try to find out where in life men are exempt from similar unrest and dissatisfaction over their own inefficient service.

To turn again to Dr. Martineau, who certainly was a wise man in his day, we find that he selects the very "breadth of opportunity enjoyed by teachers of religion" as one cause of their limitation and their burdens. Surely that is not something to be sorrowful about, or to run away from. He points out that the clerical profession rests upon a two-fold need: A learned ministry, with ripe scholarship and disciplined thought, to deliver men from the tyranny and the isolation of their own age; and this can be rejoiced in where there are no insincerities and reservations and no obligation to certain narrow and dogmatic results,—which no man to-day charges upon the ministry as peculiarly incident to our times. The other need is of "the prophet's voice which appeals to the living witness of God in a common humanity." This prophetic power is a gift, as distinct from learning, which must be acquired, but there is no incompatibility between the two, and the former, he says, should be eager for the yoke of patient discipline. When we are asked what constitutes the call to the ministry, we may turn to his words:

> "The dim and mystic zone of our higher nature, where the human meets with the divine, grows so clear to some that they can divide the light from the darkness, and turn what to us is a confused chaos into a firmament of stars."

If the light of God has so shone into a man's own soul that his firmament is filled with stars, and God has taken possession of him, he ought to have something to say to his neighbors and know what is that call which moves a man to give himself wholly to this service.

May not the disturbance which possesses some young men be explained by Martineau's phrase:

> "The native prophetic fire often burns into false heats of impatience and presumption upon young hearts, and tempts them to decline the toils and despise the discipline of steady culture. But this belongs to its human infirmity, not to its divine excellence, and entails the vitiating curse inseparable from pride and conceit."

If this final suggestion should help to save even one soul in whom the prophetic fire really burns from that impatience with the conditions of its service which would tempt him to try and escape from them, the sorrowful tale of "a soul's tragedy" will not have been without its blessing.

New York City.

How We Live to Keep Her Going

BY JAMES H. WILLIAMS

[This article by Mr. Williams naturally follows the one printed in our issue of January 7th, entitled "How We Live to Make Her Go."—EDITOR.]

THE scale of provisions contained in the shipping articles, and sanctioned by the Board of Trade to be served out to British seamen to-day, it is said, is the identical scale designed by Admiral Lord Nelson to keep his crews from actual starvation.

The addition of lime juice and vinegar as antiscorbutics was an afterthought of the sycophantic sawbones, inspired by the alarming prevalence of scurvy among British seamen. This addition is the only improvement in a food scale which has been in force more than one hundred years.

Nelson was a great seaman and a splendid admiral. He was a man with one eye, one arm and one idea. He enjoyed a monopoly of the fighting business in his time, but he was short in the humanitarian line. It wasn't in him.

It was his custom to examine all unpleasant objects with his blind eye.

When serving as vice-admiral at Copenhagen, and his ships were doing splendid execution on the outpointed Danish fleet, his superior, Sir Hyde Parker, signaled "Discontinue the fight." Nelson clapped the spyglass to his blind eye, turned it in the direction of the flagship, and exclaimed to his flag captain, "Hardy, I can't see any signals! Go on with the fight!

Nelson won the fight and thereby saved his own neck. And he has won ever since in so far as a sailor's rations are concerned. I suspect that he always examined the sailor's mess kid with his blind eye, too, for I have never yet seen anything worth eating in a British ship's forcastle. Nor have I ever seen a British ship's forecastle fit to live in. Exceptions may of course exist, but in such cases they only serve to emphasize the rule. And it has somehow been my misfortune to get shipmates with the rule instead of the exceptions every time.

Great Britain owes an everlasting debt to her seamen. To

> The sturdy boys of the bulldog breed,
> Who made Old England's fame.

It is really amazing how a country whose greatness and national existence have always depended in the greatest measure on the valor and loyalty of her seamen should not appreciate their value more and protect them better than England has done.

That sterling friend of the sailor and far-seeing legislator, the late Samuel Plimsoll, of revered memory, clamored boisterously and persistently in Parliament for many years for a better merchant marine, and better conditions for the man before the mast. But England was slow to harken to his fervid appeals, backed, as they were, by the most abundant and convincing evidence of her own culpable and ungrateful neglect of her natural defenders.

It was eighteen long years from the time when Mr. Plimsoll began his great fight for sailors' rights before the first draft became a law. Even then it passed in a badly emasculated form, but it was an improvement, and other reforms followed, while still others are now pending. Mr. Plimsoll continued his noble fight to the end of his days. And, altho he left much to be desired, he left the British seaman much for which to be thankful; and he died happy in the knowledge that he left the world better than he found it, and that he had earned the lasting gratitude of seamen the world over.

Under the present British laws and marine regulations, the seaman is as well protected at home as he deserves to be. If he needs further protection he should secure it himself by self-effort and organization.

When abroad, however, he is practically helpless against the lawless ex-

actions and unjust impositions of crimps and harpies of various degrees.

While on board ship he must submit to the starvation policy of bloated shipowners and the peculations from his wages practiced by conniving shipmasters. It is a well known and well authenticated fact that many British skippers—aye, and owners, too—have not scrupled to sell their shipping to the crimps in New York and elsewhere, for a moiety of the sailor's "blood money." For the perpetration of such pernicious crimes in their own country they would, if detected, promptly find themselves in jail with their tickets peremptorily revoked.

While sojourning in the Far East British skippers, as a rule, withhold the wages accruing to their crews, and refer them to one or more of the native "bum boat" men or tailors, who make a specialty of this nefarious business, for whatever they may require.

These heathen blood suckers pay commissions ranging from 10 to 25 per cent. to the skippers for all goods, grog or cash furnished their crews, adding the same to the seamen's bills plus an additional charge for "credit." This evil practice seems to be almost peculiar to British skippers, who seem to regard it as a rightful, if not legitimate, source of income. With all their faults, I am happy to state that I have known but very few American captains who were so mercenary as to stoop so low.

To sum it all up, the reforms most needed now in the British seaman's life are: Larger and healthier forecastles, more better and wholesomer food and personal protection when away from home.

The practice so common in British ships of locating the sailors' forecastle under the forecastle deck is a positive evil and ought to be abolished. It practically precludes the use of skylights to admit light and air, for the seas breaching over the forecastle would tear away the skylights and wash us out of our bunks. In American ships the forecastle space is often too limited, but we usually have a house on deck with windows along the sides and skylights on top, so that we can see God's light and breathe the fresh air.

In a steamship one would naturally expect to find better forecastle space than in sailing ships. Such is not generally the case, however, at least not in British steamships. In sailing ships the forecastle is more roomy and, as a rule, better situated. Besides, in a steamer sailors and firemen will not agree to live together, therefore the limited forecastle space has to be divided, but is not increased.

Both forecastles in our ship, as I have intimated, were situated right forward in the bows. They were separated by an alleyway about five feet wide, and were precisely alike in shape and appointments. They were each furnished with ten bunks, ten mess lockers, a sliding mess table, which could be elevated out of the way when not in use, and a stationary bench running fore and aft along the lower bunk boards served for seating accommodations.

There were nine men in each forecastle, but the deck space was scarcely sufficient for five. The after end of the forecastle was not more than fourteen feet from door sill to bunk boards. Following the conformation of the ship's bows, of course, it narrowed to nothing at all at the forward end, or peak.

While at sea, with only one watch below at a time, we managed to get along fairly well. Moreover, we could manage to keep the place reasonably clean. First, because we had more time and opportunity to attend to it; and, second, because at sea, dirt does not accumulate as it does in port. But while on the China coast our forecastle was by common consent left to look after itself most of the time.

After twelve hours per day of dreary, exhausting labor in the blazing sun, down in the holds or in the ballast tanks, we did not have any ambition to clean anything. Not even to wash the iron rust, paint, tar or coal dirt from our faces. We generally drank our "tea" and flopped *sans cérémonie*.

When we all came below to dinner together there was not room for us to get out of each other's way. The mess kids were set on the table and then we all scrabbled for first chance, because we could not all get to the table at once. The man who came last fared worst.

Each man stood up, as opportunity offered, hacked off his whack and went out on deck to eat it, thus making room for the next comer.

All manner of dirt and filth was tracked into the forecastle and stamped into the floor. The place always reeked with slime and foul odors.

The China coast is a most dangerous place for the unacclimated, especially during the rainy season. Even under the most favorable conditions you run the gauntlet of numerous diseases, ranging in deadliness from malaria and dysentery to smallpox and bubonic plague. Yet we were brutally exposed to the worst of all these climatic dangers with the most wanton disregard for our health, comfort and lives.

The iron plates surrounding our forecastle would retain the fierce heat derived from the sun during the day, throughout the night with the persistency of a brick oven. At night it nearly always rained, and we were compelled to take our choice between suffocation in that stinking, stifling, noisome forecastle and contracting fever by lying in the open and getting wet. So much for our gorgeous living apartments.

It is remarkable how a wealthy shipowner, who would treat his horse, or his dog, with the most jealous care, can have the heart to starve and ill use without compunction the human beings who risk so much to earn his dividends!

If I were called upon to write an epitaph for a greedy shipowner, I think it would be something like the following:

"His shade deserves a seat alone,
On a red hot griddle, up near the throne,
Where the imps of Satan, small and great—
Can remind him well of his sailors' fate."

In the year 1890 I went out to Japan in a full rigged sailing ship, owned by William Thompson & Co., and hailing from St. Johns, N. B. The voyage occupied nearly 15 months, and I was discharged in New York on March 20th, 1891. Our passage out to Hiogo occupied 5 months and 19 days, and our passage home kept up busy during 176 days and an equal number of nights. During all that long, tedious voyage I never felt the pangs of hunger for a single moment. I never ate a single hardtack, but nice white, sweet flour bread instead. I never passed a day of the voyage without plenty of fresh vegetables, and I never went three days in succession without tasting *real* fresh meat.

We carried an excellent steward and an equally good cook, and always enjoyed good, well prepared food in abundance and variety. Baked beans and brown bread every Sunday, and that without stint. And through the week good lobscouse, slumgullion, dandy funk and American hash alternated each other with pleasing regularity. Our beef and pork, as well as all our stores, were of the best quality. We also carried live pigs and sheep and slaughtered them as required. We lay three months in Japan, and lived on the best the market afforded all that time. We suffered badly in an Indian hurricane on the passage out, and both ship and cargo sustained much damage, which must have subjected the owners to heavy pecuniary loss. Yet I heard Captain Donald state to a friend after our return that, on the whole, the voyage had been a most successful one.

Now if an old wind-jammer can make a voyage like that and at the same time feed her sailors well and still pay dividends, I want to know why a tramp steamship that is seldom at sea for more than three or four weeks on one run, should find it necessary to feed us on rotten salt junk and wormy hardtack—with our bare allowance of that—and then ruin our systems with "fortified" lime juice to keep us from getting the scurvy.

If there is any shipowner living who can offer a good, plausible excuse for such criminal parsimony on the part of the tramp owners, I should like to hear from him.

The British sailor is allowed one and one-quarter pounds of pork for a day's ration one day and one pound of harness beef the next. Twice a week he is allowed canned meat or "fresh mess," but on those days his allowance of salt junk is stopped. He is also allowed about a pint of yellow split peas per week, and a half pound of flour each Sunday, Tuesday and Thursday. He also gets three quarts of water per day while at sea.

The scale is merely a matter of contract, not a statute like the present

American scale of provisions. And, therefore, the master reserves the right to give his crew such substitutes for any item on the bill of fare as he finds most convenient. The allowance of hardtack is one pound per day.

When you read this over you may think it represents a good deal of food. Let me tell you a few secrets in regard to it.

Go down to a ship chandlery and purchase 12 pounds of harness beef just as it comes from the cask and take it home for your Sunday dinner. Put it in a pot and let it boil three hours. You can open the windows and go out in the yard meanwhile. Now, take your salt junk out of the pot and weigh it again and you will find that it has dwindled to about 7 pounds, or thereabouts. The reason for this shrinkage is that in the process of boiling most of the salt and saltpetre, with which the junk was saturated when you weighed it at the cask, has been dissolved and escaped into the hot water. And the slush has been boiled away, too. But now proceed to dissect your piece of junk, and separate it from the bone and whit leather and other parts you cannot eat, and set the remainder before twelve workingmen and tell them that is their whack for the next twenty-four hours. I hope that any one who tries this experiment will let me know the result.

Nearly one-half the pork is not edible and has to be thrown to Davy Jones. The remainder is wonderfully tough and stringy, like rope yarns, and about as palatable. As for the "fresh mess," that is the residue of meat from which meat extract has been made. It is put up in bouli tins and sold for sailors' use. It is about as nutritious as wood fiber.

We are also allowed 14 ounces of crude sugar per week per man (worth about 1 cent per pound), and half a pound of rancid butter, not fit to grease you sea boots with. In consideration of these luxuries we must give up ½ pound of beef from each ration, and this is what reduces our whack to 1 pound per ration.

It will be noticed that we must lost one and one-half pounds of beef, worth ten cents per pound, in return for which we get some axle grease which we can't eat and don't want, and less than 1 cent's worth of dirty sugar that the poorest laborer ashore would reject. Such is "a life on the ocean wave" and a home in an English tramp.

"Hunger and ease" was the old sailor's commentary concerning English ships. I guess he was one of the old packet rats, who paid himself off with the jib downhaul at each port.

Except for the food and general discomfort English ships are all right at sea. Hazing or brutality is almost unknown in them; and, as I have already stated, they are famous for watch and watch. But in a foreign port, especially in any part of Asia, they will work you to the limit, and starve you besides, or else compel you to live out of the bumboat and pay the skipper a commission on what you eat.

I once lay two months in Calcutta in an English ship, and my two months' wages did not cover my bumboat bill. These reasons account for many if not most of the desertions from English ships during recent years, which have given the British Government so much concern. If the British Government would give its merchant seamen the right to demand their discharge in any port when a month's pay was due, the ships would be better and in a short time desertions would cease from want of cause.

There is plenty of work on the China coast, and any man who is afraid of work had better not go out there before the mast. From the time we struck the coast until we left it again, three months later, was one dreary, hopeless round of unceasing and unrequited labor. Night and day the steam winches wrestled the cargo in and out. Work twelve hours, then lie down (if you could find a place), and listen to the horde of yelling coolies and the rumbling of the six steam winches distributed along the iron deck until morning Then turn out at half past five, get your "boot leg" coffee and harness yourself for another day's labor. Such was our daily routine on the coast. If we happened to finish up at one port just at knock off time we would spend half the night making preparations and getting under way for the next port, for no time was to be lost. As soon as we got her under way

we would set sea watches just as tho we had been below all day instead of at work. No allowance was ever made for time thus lost and we received no extra pay, neither was our time ever made up to us. On the other hand, if any of us were absent from work at turn-to time or neglected our work for any cause, we were fined two days' pay for the first offense and six days' pay for any subsequent offense up to fourteen days. After that I guess they could hang you.

It is impossible to estimate the amount and variety of work done on a big ship while in port. The ten cargo booms needed constant care and attention, for this work could not be intrusted to the coolies. Eight of these booms were about 45 feet in length and were attached to the masts in pairs, two extending forward and two aft from each mast.

These booms were solid pitch pine sticks of great strength. They were secured to the masts by goose necks at the heels, about eight feet above the deck, and the hoisting ends rested in beds placed on a level with the goose necks, when they were not in use. When the booms were needed for service the free end was hoisted by a wire runner, leading through a sheave at the mast head, to whatever angle the occasion required. An able seaman then went up and shackled the big chain span attached near the end of the boom to the mast head. The runner would then be slacked until the weight of the boom rested on the span. The guy tackles would then be hooked out, the cargo runner attached to the drum of the winch, wound up, and all is ready for business.

Our hold was divided by transverse bulkheads into six compartments, besides the engine and bunker compartments. The four main holds were numbered from one to four, and the two smaller ones were known as the fore and aft peaks.

All of these holds were lined with long wooden stringers throughout,'tween decks and all, to keep the cargo from coming in contact with the iron plates and being damaged thereby. When the cargo had been discharged all of these holds had to be thoroughly cleaned and renovated before new cargo was received. We worked for weeks down in those compartments. The stringers all had to be taken down. Then we chipped and scraped all the plates and angles and frames from the ballast tanks to the main decks. We did the same with the bunker hold, for that was to be crowded with cargo, too, and we were to take a large portion of our steaming coal on deck. We painted the holds throughout with a strong chemical white paint, which, in that close atmosphere, burned your eyes like caustic.

We raised all the limber hatches throughout the ship and cleaned out and cemented the limbers. We crawled through all the ballast tanks like so many rats, baled them out, then scraped and cemented the frames and girders inside. Then we replaced all the long wooden stringers, swept the holds perfectly clean, stowed all our dunnage in good shape and all was complete, for which nobody was sorry.

By this time the combined efforts of our daily exertions, sleepless nights and want of proper nourishment became painfully evident. With the exception of myself and the bos'n every one of the crew had been laid up some part of the time. Spike Riley remained in his bunk a whole month, and defied any one to turn him out. And his books did not belie his statement that he was sick, for he was a living skeleton. As for me, unfortunate wretch that I was, I couldn't even look sick.

The third mate said the men were shamming sickness to avoid work; the mate said they were drunk, and the Old Man alleged that they had been "gorging themselves." May he live to be as hungry as we were.

For a long time there had been a continual growl about the grub. But it had been of no avail. The food might have been tolerable if it had been properly cooked. But an English ship cannot afford to carry a good cook, it costs too much. Any one who can boil water will do for the sailors, and the steward is usually obliging enough to cook for the cabin table. If not, they get one who is.

We threw away more food every day than we ate. We used to pile the waste chute full of swill every day and leave it there until next morning, for the Old Man to contemplate. We had a

lot of rotten potatoes in the fore peak which had spoiled on the passage out for want of attention and air. The whole Yang Tsze Valley stretching away on both sides of us was flourishing like a garden of the Lord and bringing forth all manner of fresh and wholesome fruits and vegetables in prodigal abundance. We were allowed to see, but not to taste, the good things which God had provided for all. We peddled away all our clothing, tobacco and other available property to the Chinese venders for food. At length we were nearly all stripped to a gantline. Spike Riley said that if it kept on he would have to paint himself and go naked, like a South Sea Islander.

By no amount of pleading, however, could we get any reform. The Chinamen in the gallery refused to wash or peel the potatoes or pick out the bad ones before stamping them into scouse. They said the steward told them not to bother with them. Our rootees, which we only got three times a week, were nearly as heavy and opaque as deep sea lead. Thus we were deprived of our favorite article of diet even, because the heathen lubbers knew no more about raising bread than they did about raising their beggarly wages. When we appealed to the steward he told us to go to the Old Man, and he in turn told us to go forward.

There is a point at which patience ceases to be a virtue and further submission becomes comardice. All lawful and fair means having proved unavailing, I determined at last to get up a little mutiny on my own account. At the most I could only be sent to jail, and then I would get clear of the ship, which was in all respects decidedly worse than the calaboose. With this determination in mind I went aft to the galley door one morning at breakfast time for our usual pan of scouse.

Taking the big panful of steaming scouse, I went up to the Old Man's room on the bridge.

"What do you want now?" he said surlily, as he opened the door in response to my knock.

"Captain," I said politely, extending the big pan, which I held in both hands, "I have brought you an invitation to breakfast. Come down and join us, sir; this scouse smells delicious."

For a moment the Old Man was speechless. Then he turned on me in a towering rage and thundered fiercely, "Get down out o' my sight, you damned impudent hound! What do you mean? To insult me on my own bridge? What 'ell next, mutiny? Get down from here!" he shouted again—nearly out of breath now—"or I'll have ye sent to the calaboose! I will, s'elp me! I will, damn me!"

During all this tirade, which was delivered with much gesticulation and a large show of hands, I had remained at my post. I stepped back a little to give the Old Man room to expand, but that was all. As soon as I saw that he had blown off his surplus steam and his escape valve had closed, I took a step forward again, mess-kid in hand, and said, as deferentially as possible:

"Captain, I give you notice that I refuse duty until I get something that I can eat. I absolutely refuse to work until I am fed. You can take such measures as you please, sir, in regard to my conduct, but I will get a hearing somewhere."

"Ah! ha!" he shouted, recovering his speech again. "Sea lawyer, eh! All right, me hearty; I'll give you all the law you want!"

By this time I was half-way down the ladder with the mess-kid. I had spoken my lines and he had heard me. I was satisfied with myself, anyway.

By this time several of the crew had gathered on the flying deck, attracted by the captain's loud talk. As I walked sedately past them on my way to the galley to return the pan of garbage, I heard the Old Man call out to them to get to 'ell for'ard and not stand there gaping at his quarters, or he would find something interesting for them to do. On reaching the galley I passed the pan in to one of the Chinamen and told him if he didn't cook better next time I would cut off his pig-tail and take it home for a curio.

So saying, I turned away, intending to go forward. At this juncture, however, the steward, who had heard the row and had probably come aft on the other side of the fidley to see what folly I would commit next, appeared at the opposite side of the galley. He was a red-faced man, slightly bald, with all the airs of a typical servile, cringing English flunkey.

That morning he was all prepared to serve his master's breakfast and was clad in a striped shirt and white linen trousers, girded with a broad belt of russet leather ornamented with a nickel plated buckle. Thinking that I was gone, he stepped into the galley and said to the cook, "What ails that fellow?"

"H'm," said the Chinaman, "sailorman too muchee bobbry; no likee mungee."

"Too dam' good for 'em!" commented the steward, in a tone meant to be supercilious. "We'll stop the hash altogether if they don't look out; then they'll have some'at to growl over."

This was the last straw. It was adding insult to injury, and was intended as a cowardly attack behind my back, for the steward had no idea that I was within hearing distance.

Stepping out from behind the iron door, I sprang into the galley, and seizing the pan of hot scouse again, I exclaimed, "Steward, if this is too good for us, you can have it." And before he had time to divine my intention or get out of the way I inverted the pan over his pate and literally crowned him the King of Spuds.

The steward gave a stifled scream as the hot mess ran down his neck and over his clean clothes. For a moment he stood irresolute, evidently debating some mode of retaliation in his mind. Then he darted out of the galley and ran toward the bridge on the port side, exclaiming, "Dam' you, I'll fix you!"

I felt sure there were breakers ahead now and fully expected to land in the calaboose and do a turn on the stone pile. As I walked forward I nerved myself for the occasion and determined to hold up my end of the argument, come what might. If I should be arrested I knew I would be given a hearing, and I could tell some things about both captain and ship that might open the eyes of the port authorities and perhaps lead to an investigation into the state of affairs existing on board and an official inspection of our food (?).

Just as I reached the forecastle door, as I expected, I heard my name called. As I came out on the main deck I met the bo'sun nearly convulsed with laughter. For the moment he could not speak, but ordered me up to the bridge in pantomime.

The group which confronted me as I ascended the bridge ladder to surrender myself certainly made a most dramatic appearance, surrounded by all the stage settings for a first-class marine comedy. In the foreground stood the dripping steward, flanked on either hand by the first and third officers. The steward, with arms slightly extended, held a much besmeared handkerchief in his right hand, with which he had evidently been wiping his face; the second mate stood leaning over the gunwale of the port dinghy with his back turned to the rest, apparently deeply engrossed in an examination of the boat's fittings inside. In the background stood Spike Riley, who had been making a bluff at working that morning. His soogi wad lay neglected on the deck and he was executing a series of contortions and facial grimaces that threatened to dislocate his whole anatomy. I glanced at him with some concern as I came up, fearful that he was about to throw a fit.

Spike caught my anxious glance, and making a despairing gesture in the direction of the newly anointed king, continued his contortions with increased agony.

The third mate looked serious and the chief mate looked important. I don't remember how I looked.

At a word from the mate, announcing my arrival, the Old Man stepped out from the chart room. Rushing over toward me and shaking his big fat fist about a foot from my face, he bawled out: "How dare you insult an officer of my ship! What do you intend to do—take charge? What did you do that for?" he continued, pointing toward the bespattered monarch of the storeroom.

"For revenge, sir," I replied, "I can't endure this starvation any longer."

"Well," resumed the Old Man, "I will teach you better than to commit mutiny on board of my ship. I must protect my officers. I will log you fourteen days' pay for assaulting the steward, and six days' additional for refusing duty. Twenty days' pay in all."

"Very well, sir," I responded, meekly, "it is worth the money to get satisfaction out of that old duffer, but if he is an officer, I am sorry for your ship."

After I had submitted to another reprimand and received strict orders to hold onto my jaw tackle fall, and get t'ell for'ard, the court-martial broke up and I left the bridge.

So ended my trial. I had missed my calculation about getting into jail, but I had had some degree of satisfaction, of which even the payment of a fine could not deprive me.

And I even got better satisfaction than that, for after that incident the captain issued orders to pay more attention to the sailors' and firemen's food. He also saw for himself that it was properly cooked. After that our "fresh junk" was roasted instead of boiled, and gravy made to go with it. Vegetables, such as onions, carrots and greens, were introduced into our soup, making a savory and palatable dish. We got better soft tack, too, for the steward made it himself. The two Chinamen were set to work to get all the spoiled potatoes out of the fore peak and cull them over, saving only the sound ones. During this process the stench from the decayed spuds was so unbearable that we all had to move out of the forecastle for a day or two, and dress as best we could.

So after all by exhibiting a little nerve and determination I secured better food for all my shipmates, as well as myself.

Necessity, they say, is the mother of invention, and we discovered three different methods of dealing with wormy hardtack, which I shall describe here for the benefit of any of my readers who may happen to get shanghaied in a tramp. The first method is to soak the biscuit over-night in sea water. Then place them in the oven, if the cook will let you. The heat will cause the softened biscuit to swell and the dispossessed weevils will crawl out, like the proverbial fish that leapt from the frying pan into the fire, leaving little greasy streaks behind them. The biscuit is then good to eat, if you only think so.

The second method is simpler. You merely grasp the hardtack between your forefinger and thumb and gradusually immerse it in a pannikin of scalding hot coffee. The weevils will all ascend to the dry portion between your thumb and finger. Now break that portion off and throw it away, and eat the rest if you want to.

The last method is the simplest of all, but it requires some confidence to execute it. You just shut your eyes and eat the hardtack, weevils and all. Spike Riley says that by this method you get fresh meat with your bread. He intends to take out a patent on it.

And now, dear reader, before leaving Shanghai, I want to make a confession, and tell you a secret that may be of use to you some time; for confession is good for the soul.

While lying at Shanghai it was heartrending to look at your shipmates, walking around with sallow, sunken cheeks and staring eyes, like living skeletons; or lying in their bunks pining for something good to eat, something nourishing and soul inspiring. Yet through all this siege of misery and horror I managed to keep plump and strong.

I left Norfolk weighing 174 pounds, and I reached New York after nearly seven months of dreary labor and starvation weighing 169 pounds. This is about my normal weight, for when I shipped I was rather too fleshy to be good.

How did I manage it? I will tell you, I stole.

I stole everything in the shape of good food I could lay my hands on. Not only that, I made it a business and a specialty.

I seldom stole enough at one haul to be noticed. Only a handful at a time, such as I could tuck away under my jumper, or stow away in my pocket. Almost every day while we were on the coast I managed to secure as many vegetables of various kinds, fruits, eggs, or other articles as I could eat. The other boys grabbed a handful, too, sometimes, but they didn't steal enough. I made a day and a night study of it, and all the eyes in the ship couldn't detect me. On several occasions I dived into the galley and secured fowls roasted for the captain's dinner, and I often made raids on the pantry. But these latter exploits could only be performed when the hatches

were open. Then I could throw my booty into the hold instead of carrying it around with me, and afterward go down and find it. Whenever I made an unusually good haul I whacked up with my shipmates. But I always looked out for number one. While Spike Riley was laid up he was fed from the cabin, but when he was on deck he could steal as well as any one, so I didn't pity him if he didn't get enough. From my own point of view it is no sin to steal food where you work for it, and it is denied you. Men who worked as hard as we did were certainly entitled to our morsel, and if it was a sin for us to steal it, how much greater sin was it to withhold it from us after we worked hard for it.

I do not know whether the editor will print this story or not. But in case he doesn't, I will try to recover the manuscript, provided I can get to the office before they dump the waste basket. Then come over to West Street and I will read it to you aloud. You will find Spike Riley at the Glad Hand, where they serve out salt herrings with stale beer. And you will find me at the Hard Fist, where you get sour pickles with rotgut whisky. For they won't have us both in one house. I tried to get Spike to change boarding houses, but he says he thinks he'll let bad enough alone.

Poor old Spike got his arm broken and his head split open on the passage home in the interests of business economy. I'll tell you all about it some other time.

But Spike's days in the forecastle are numbered. He is a poor, worn out, broken down old sailor, who has given 45 years of a strenuous life to promote the world's happiness. He has given far more than he has received, and the world owes him a debt.

And I? Whither shall I go? Quien sabe? For the sailor is the shuttlecock of fortune; a man of wandering ways and uncertain destiny. But his mission on earth is to do good. He must perish that blessings may abound.

But he leaves the direction of his course to a Higher Hand. As for me, I have but one purpose in life—to fight the crimp, and I must go where The Purpose leads me. For it is written: "The crimp must go." And when he's gone,—then I'll go, too.

NEW YORK CITY.

Race Suicide

BY HOLT A. MILTON

[The author of the following article is, as he alleges, a real editor of a New York magazine. But as the story is true in its essentials he prefers to use a *nom de plume*.—EDITOR.]

I AM the managing editor of one of the New York magazines. I live in a pretty New Jersey suburb with my wife, my two children and my library. Wednesday is the "red letter" week-day for me, for then I take a late breakfast and spend the day at home, reading without interruption the week's accumulation of manuscripts. I have no telephone in my house, and as I live three-quarters of an hour from the office, I can count on escaping that host of literary aspirants who frequent the sanctum of any editor having the reputation of being accessible to callers.

The incidents that I am about to relate occurred on one of the Wednesdays a year ago last February, just at the time when the whole country was discussing President Roosevelt's pronunciamento on "race suicide." It was in the middle of the afternoon and I was comfortably ensconced in my Morris chair, with my feet on a stool, a blue pencil in my hand and my manuscripts on a chair beside me. I was in the best of humor, for I

had just eaten a hot home-cooked luncheon, and, what is better still, had taken my time over it—two blessings I do not enjoy on the other working days of the week—and I was leisurely puffing one of my favorite cigars. A light wood fire burned gently on the hearth before me, and its balsam fragrance and genial warmth pervaded the room. My two little girls were out of doors with their nurse, playing in the snow, which was still soft on the trees and fences, and my wife, who always saves her household sewing until Wednesday, so as to sit beside me while I work, had just been called upstairs on some household errand. Everything considered, I was as satisfied with things in general as a sunned cat!

I had been at work all the morning, but still had about fifteen manuscripts to pass upon—a task which I calculated would require another hour's work, not much of a feat for a seasoned editor. We seldom have to read through one-fifth of the articles submitted to us, as those writers know who glue two of the inside pages of their manuscript together, and then, when it is "returned with thanks," find the leaves still stuck together! This Wednesday afternoon I was especially jubilant, for I had just made a discovery, which always sets the blood of any editor who knows his business a-tingle. I had chanced upon what seemed to me to be a work of genius from an unknown author. I had already begun to dream of the reflected glory I would soon enjoy as the editor who had bestowed upon the world the long expected "great American novelist," when the door-bell rang and a card was brought to me on which was engraved the following inscription:

Mrs. Ida H. Jennings,
The Gibson Studios,
New York City.

The name was unknown to me, but I at once suspected it belonged to a reporter. It happens that the magazine which I serve aims to print in every issue one or two timely articles on controverted subjects, and when we send out advance sheets of these articles to the daily papers their editors are likely to send a reporter to interview me in regard to them, if the articles seem destined to make a sensation.

I was rather expecting to be asked to disclose the authorship of an anonymous article by a high prelate in the Episcopal Church, which we had just printed. It was a panegyric of President Roosevelt's attitude on "race suicide," and among other things, it took occasion to denounce in no mistakable terms

"the sexless suffragists and bachelor maids,—those two new classes of women who are now to be observed for the first time in the world's history—a dire menace to the hallowed sanctity of the family."

I still held my visitor's card when the door opened and Mrs. Jennings walked in. I found before me an alert and prepossessing looking young woman about twenty-eight years of age. She was well dressed, but her clothes expressed rather that undefinable individualism affected by artists than the modes of the fashionable. With that straightforwardness that always comes from newspaper training she advanced to greet me and said:

"Good afternoon, Mr. Milton; I trust I am not intruding, but I was told at your office that you were not to be in town to-day, and I could not wait until to-morrow to see you. To be brief, I am one of the special writers of the *Star*, and when the advance sheets of the sensational article by the prelate on "Race Suicide" came in this morning, I thought I might be able to persuade you to let me answer it, for I knew the boast of your magazine to allow both sides of every question a fair hearing."

"We shall be only too glad to print the right article on the other side," said I; "but, you will pardon me, I am not familiar with your work as a writer and I do not know whether you have the—et—necessary qualifications."

"Oh, you misunderstand me," she broke in; "I do not mean that I would write the article under my own signature; I am well aware that magazines nowadays will take nothing signed by unknown names if they can help it. But the great suffragist, Mrs. Dido Stubbs, is lecturing to-night at Cooper Union, and as I know her views well and have already written four articles that she has

subsequently consented to have published under her own name, I thought I might possibly get her to sign this 'story' for you if you will only give me the order for it to-day. I know I could prepare something that would completely answer Bishop Clay, for no one else in the Episcopal Church, save the Bishop, is master of such grandiloquent invective, and I therefore assume that he is its author."

"Yes," said I, ignoring the assumption as to the authorship of the article, "it is true that even the best of magazines print articles signed by celebrities and written by journalists; I confess that we do so ourselves when it cannot be avoided, but such articles are always more or less perfunctory, and in this case Mrs. Stubbs's views are so well known and therefore trite that I do not think she is the one to answer the prelate. Anyway, Mrs. Stubbs now represents a bygone generation; she may know all the arguments for women's suffrage, but 'race suicide' is a new problem and we ought to have a new 'New Woman,' and not an old 'New Woman' to defend it."

"Of course," said Mrs. Jennings, somewhat crestfallen, "you are the judge and jury, and if you don't want it, you don't. But my newspaper experience has taught me to make as many suggestions to editors as I can think of, for I am almost always sure to get assignments on some of them. I suppose, then, there is nothing else I can do, is there? Shall I bid you good-by?"

"Wait a minute," said I, as a sudden thought flashed upon me; "I have an idea that may perhaps come to something. But first tell me, are you really a stalwart anti-Rooseveltian on the 'race suicide' question? And, if so, have you any special experience or knowledge that would enable you to write on the subject with insight and illumination?"

"Well," said Mrs. Jennings, "before I married I was the private secretary of Mrs. Malthus—you know she is the president of the Federated Women's Clubs of America—and through her I became personally acquainted with all the leaders of the women's movement in America and England. Moreover, for years I have been an untiring student of the woman question, and my views are every bit as radical and sound as those of Susan B. Anthony, Ida Husted Harper, and even Charlotte Perkins Gilman. And, what is more, in order to put these views into practice I have sworn to consecrate the rest of my life to the cause of woman."

"Then write the article yourself," said I, "and confound the good prelate. But, as your name is unknown to the reading public, we'll make the article anonymous, or print it under some such pseudonym as 'A Confessing Woman'—that will pique everybody's curiosity and make the article more talked about than if written by Mrs. Stubbs herself. Now, a few words of advice. The article will make no stir unless you are plain spoken, candid and, if necessary, sensational. Moreover, you must seem to reveal the very shekinah of the Advanced Woman's mind on 'race suicide.' The fact that you are a woman who is confessing, and not a mere man, will make people heed you; for your sex, and not ours, must settle the 'race suicide' question. If you can produce something acceptable and publishable, not exceeding 3,000 words in length, I will pay you $75."

"I will have the manuscript in your hands in four days," said Mrs. Jennings. "Thank you for giving me the opportunity." She arose to leave.

"Please sit down again," said I, as I looked at my watch. "You still have twenty minutes to wait before your train leaves for town, and you will be much more comfortable here by the fire than in that little shivering railroad station. Besides, there will be time for you to tell me some of the things you are going to say in that epoch-making article."

Mrs. Jennings sat down. She waited a few minutes and then said slowly: "I think President Roosevelt's theory of large families is simply brutal. When the country was young and the population sparse there might have been some excuse for asking women to bear and rear large families. The country needed them. But now the population is dense, the struggle for existence is becoming keener every day and the cost of living is rising. The conditions have entirely changed. What we want is better, not more, individuals. Why should children be brought into the world by wholesale only to suffer, to toil and to

die? Did they ask to come? Have they no rights? Why should fathers be expected to labor incessantly for those who, in the majority of cases, will never repay the sacrifice? And why, above all, should women give the larger part of their time from twenty to forty-five—the best portion of a woman's life—to the rearing of children? To ask a woman to go through the perils of childbirth because the Bible says 'replenish the earth,' may be a sufficient reason to a bishop and the whole tribe of bigots who ever prate about woman's 'sphere,' but it is no reason to the woman who thinks with her brain. You see," Mrs. Jennings continued, "I get excited when I hear men like Bishop Clay tell women what their duties are. My husband, who is an artist, never tells me what are mine. We have been married five years; we have no children and do not want any. We are both fond of literature, art, the theater and of self-culture. We married so as to enjoy these things in common. We each try to treat the other as a rational being, and I am proud to be able to say that since we were married I have entirely supported myself. I have never asked my husband for a cent. I am sure ours is the highest type of union; we are happy, and while we might be willing to have a child if we could bring one up without sacrificing our standard of life, we won't have any now; at any rate, not while we have to live in a flat.

"Of course," she continued, "after infancy is past there is much that is sweet in the companionship of little children, but there is nothing intellectually stimulating in the care of them; and no woman who faithfully discharges her duty can have sufficient time properly to cultivate her higher nature. I tell you, Mr. Milton, if men had to bring forth the children there would not be more than one child in a family; and if men had to undergo the drudgery of rearing them the male sex could never have produced an Aristotle, Shakespeare or Lincoln. It is this enforced burden of child-bearing and child-rearing, and nothing else, that has prevented women from competing with men and becoming the geniuses of the world."

"I suppose," said I, as Mrs. Jennings paused a moment, "you would not go to the extreme of Tennyson's 'Princess Ida'—you would allow husbands to exist, if not fathers?"

"Why, no," she replied, laughing, "I am not so absurd as all that! Personally, I like children, but I am one of those who feel diffident in their presence; I do not know what to say to them when they come to me. I suppose I should love one of my own, but, as I have said before, my whole sense of justice revolts when I hear such men as Bishop Clay and President Roosevelt unctuously dilate on the innate sacredness of motherhood. To show how silly their talk is, it is only necessary to ask them whether motherhood is sacred if not preceded by wifehood! I tell you, Mr. Milton, you never hear a woman whose opinion is worth heeding arguing that—"

"Father, I want to tiss you."

Mrs. Jennings stopped; we both turned toward the door. There stood, hand-in-hand, on the threshold, my two little girls, sunny-curled Eleanor, three years old, and chubby Margaret, nearly two.

Both were bundled up so warmly in their white caps, coats and leggings that they looked as round and warm as stuffed snow-birds. They had just come in from their play in the yard, and their pink-red cheeks glowed from exercise, while their four sweet baby eyes looked saucer-big at the strange lady by my side. If I say it myself, it was as pretty a sight as you would care to see.

"Father, I want to tiss you," repeated Eleanor. But neither she nor Margaret moved.

"Well, come in and kiss father," said I, "here I am."

Slowly and without a word, but all the time with their eyes fixed on Mrs. Jennings, they walked across the room, and each precious little daughter put up a cold warm face to be kissed. Then, with equal silence and without removing their gaze from Mrs. Jennings, they walked back hand-in-hand toward the door. There, having lost their constraint, they were about to scamper off to the nurse, when I called: "Stop, little girls. Won't you say good-by to the lady before you run away and have your things taken off?"

Baby Margaret, as I must confess is her habit, paid not the slightest attention

to this request, but Eleanor stopped, turned back and said: "Dood-by, pitty lady." Then, racing to the foot of the stairs, called up at the top of her voice: "Come, mother, come quick! A pitty lady's down stairs!"

Mrs. Jennings arose. She was evidently embarrassed, and I thought I saw a trace of moisture in her eye, tho I will not be sure about this, since my wife says I am apt to be sentimental on occasions. At any rate, Mrs. Jennings hesitated a moment, and then said:

"Mr. Milton, will you pardon what I have said? I—er—I did not realize that you had children."

She paused, seemed about to say something further, but only added:

"I must be going now or I shall lose my train. Good-by."

She held out her hand, and then, without another word, left.

I am still waiting for the article.

NEW YORK CITY.

The Feeling in Colombia.

[The following article is from a trusted correspondent in Colombia who is a resident of the Republic. He does not wish his name used for obvious reasons.—EDITOR.]

THE news of the secession of the State of Panama from the Republic of Colombia was received here with great indignation among the Government people. Prominent men came to the front with outbursts of patriotic zeal, denouncing as traitors all the natives of Panama, now called Panamanians, and Colombians who actually took part in the movement of November 3d, 1903.

I took heed, as speaker after speaker ascended the tribune which was placed in the public "plaza," with a goodly crowd of listeners around, as to whether there would be any bitter utterances against Americans; but all their wrath was poured forth on the Panamanians, who were accused of having sold themselves and their territory for the gold of the Americans; traitors as they were, their punishment would be severe; Colombia would know how to chastise her wayward sons and make them pay dear for their rebellings; their blood would be the price of their attempted independence, and the blood of the "Yanqui" would also have to wet the soil of the land that they were humiliating and trampling under foot.

An undercurrent of feeling cast all the blame of actual happenings on the Government. Congress should have foreseen the consequences of non-ratification of the Canal Treaty, and to the Historical Conservative party, the Government of to-day, is attributed all the adversities of the nation. Such a popular demonstration of this feeling was stirred up in Bogota, the capital, that at one time it was reported that the President was deposed and that a state of confusion was predominant in that quarter.

Apparently no measures were taken by the Government to prevent such a movement. To the Government, independence of the State of Panama was an impossibility, for at any time Colombian troops would become masters of the situation, and with the aid of the Americans it would be an easy matter to suppress any attempted revolt. Great faith and trust were placed in the honor of the United States Government for keeping intact the existing treaty of 1846, which had several times proved to be a refuge to Colombia in times of need. Not long ago, during the late revolution, the presence of American forces and war ships contributed to put an end to a disastrous three years' civil war; surely their aid would again be successfully called

upon. Unfortunately for Colombia the tables were turned; what served her in times past as a sure defense has now blocked the way for recovery of her lost territory. Succeeding events naturally aroused an intense feeling against President Roosevelt, who was styled in a recent publication, "El Gran Ladron." Robbery on a large scale had been accomplished, but the American people would never consent to such high-handed measures. A message was sent to the American Senate by President Marroquin, appealing to the people of America for justice, and thus denounce the act of piracy that had been perfected. Colombia must arise united to preserve and defend her national honor and integrity. All parties were called upon to take up arms in defense of their country. Liberal chiefs and Nationalist Conservatives rushed to offer their services to the Government. In the general excitement party distinctions were forgotten; from all sides volunteers were turning up. Colombia must fight!

Considering the weakness of Colombia, her enemies all ready to take advantage of the situation should any clash with Panama and the United States take place, the fear of arming her internal political assailants, Colombia finds herself in a sorry plight. Venezuela is ready to invade her territory; Peru is in possession of part of her territory over the border, and will have to be dislodged. Colombia is doing well in massing her troops; she will have to fight sooner or later; she may turn her attention from the United States to her other foes. Colombia was divided into nine departments. The feeling in this department, Bolivar, is rather indifferent. Barranquilla, a city of about forty to fifty thousand inhabitants, shows no enthusiasm to go to the Isthmus. They will fight if the Americans come here, and will only serve as "volunteers" when forced into service by a peculiar method common to these countries. They are hunted up, captured, bound with ropes and thus conducted by a squad of regulars to the barracks. There their only method of escape is in service, for in the conflict the first thing they do is to run away. In Cartagena, the capital of the department, a city full of Government people, Conservatives, the feeling is intense. Not long ago an American citizen, on board of his launch in the harbor, was assailed by an official of a Colombian gun boat. Without any provocation save that of being under the influence of liquor, he hailed the American and told him that if he stepped off his launch he would shoot him dead; the only possible reason being that he was an American, and, therefore, an enemy to Colombia. The American went to his tool chest and provided himself with a hammer, which he used with dexterity and felled his assailant. Both of them were arrested and subsequently liberated, tho the Colombian was laid up to recover from his injuries. Americans coming from Antioquia declare that up there there is no feeling against them; indeed, so great is the dissatisfaction with the Bogota Government that they have threatened separation. The Department of Cauca has sent up a petition to Bogota demanding reform in Government. They want to govern themselves as a State, and not to be governed by the Central Government at Bogota. They will be loyal to Colombia, but will separate if no heed is taken of their needs. Antioquia, Cauca and Panama are the most progressive States, and they have long felt the Bogota Government as a drag on them and a bar to their progress. It was rumored once that these two States proposed to join Panama and thus declare themselves separate from Colombia.

COLOMBIA.

Yale Wars of the Conic Sections

BY CLARENCE DEMING

[The following bit of forgotten Yale history will be read with almost as much interest by the general public as by the Yale alumni. Not least important is the letter by Josiah Quincy here published for the first time.—EDITOR.]

IN the long annals of Yale, spanning more than two hundred years of her life as university and college, a period of about a decade and a half, following the accession of President Jeremiah Day in 1817, registered a kind of high-tide mark in undergraduate turmoil and insubordination. The immediate causes are veiled by time, but there are some signs that, while the Yale faculty of the period was fairly coherent and united as to general principles of discipline, it lacked what would to-day be called on the athletic field "team work" in practical administration and in the functions of the class-room. Hence there ensued a sort of epidemic of student restlessness, disorders, penalties and frequent letters to parents, and, in particular, during the twelve years from 1819 to 1830 inclusive, no fewer than four organized rebellions. Two of the rebellions were of the stomach and two of the brain. The two of the stomach, originating in that perennial font of trouble, the Yale Commons, were picturesque, but have too recently been described in the Yale prints to be reviewed here. But of the two of the brain the printed records are extremely meager, and in the case of one of the rebellions quite lacking. The story of them is rescued for academic posterity only from two files of dingy and faded manuscripts at the Yale Library, scheduled and filed for reference in the swift but clear handwriting of President Day, when he penned them, *currente calamo,* three-quarters of a century ago. In this, as in other matters of Yale history, posterity may thank President Day for an irksome but wise habit of keeping copies of his important letters.

Through the whole of the last century and, probably, earlier, sophomore mathematics were the bugbear of the Yale curriculum. Freshmen looked forward to them with dread, juniors looked back at them with a jocund sense of release, and sophomores were aggressive in demanding any easement which could be derived from precedent. This led to incessant trouble during a period when sophomore instructors differed widely in their exaction of class-room work; and it came to a head in 1825, when a sophomore tutor, who had the class of 1827 in conic sections, agreed—as asserted by the rebels later—that if the class would "demonstrate from the figure" instead of "explain from the book," then the corollaries would be omitted. The class accepted the compromise with delight and went over the work of the term with such zeal that they gained time, when the tutor, finding a prospective *hiatus* in the period specified for the study, violated his compact, as the class claimed, and ordered that the corollaries should be included in the review. Thereupon thirty-eight members of the sophomore class of eighty-seven men formed a "combine," refused to recite in conic sections at all and were promptly suspended by the faculty.

In this first war of the Conic Sections the faculty took firm ground. It denied that the tutor had made an unqualified promise and declared that he would have been *ultra vires* even if he had done so; asserted the complete control of the faculty over the curriculum and the class-room exercises, and called special attention to a provision of the matriculation oath under which the student pledged himself not to join in any "combination" against the constituted authorities. In the sequel the faculty won a decisive victory. The parents sustained the college authority, and the rebels one by one returned after signing a formula of submission. In the list of suspended recusants one reads with a smile the name of

Horace Bushnell. Here is the formula that the great theologian signed, attesting not merely his own surrender, but how very human famous men have been in their youth:

"We, the undersigned, having been led into a course of opposition to the government of Yale College, do acknowledge our fault in this resistance, and promise, on being restored to our standing in the class, to yield a faithful obedience to the laws."

Besides Bushnell, other suspended sophomores of later distinction were the Rev. Robert A. Hallam, Chief Justice Welch, of Minnesota Territory; Judge Henry Hogeboom, of the New York Supreme Court; Professor Grosvenor, of Illinois College, and President William Adams, of Union Theological Seminary.

But the Conic Sections rebellion of 1825 was to the Conic Sections mutiny of five years later as a skirmish to a campaign. Indeed, as measured by its immediate asperity and by its results, the rebellion of 1830 is to be ranked as by far the most grave in Yale history. Like its forebear, it arose in the sophomore class—the class of 1832—and grew out of a dispute over the form of recitation in the class-room. Stating the contention briefly, the class raised directly the question of reciting Conic Sections "from the book," instead of "demonstrating from the figure." It claimed (1) that the subject of conic sections had been crowded into a period so brief and compelled lessons so long as "to be unattainable during the time prescribed by the laws to any ordinary intellect," and (2) that, under such conditions, the sophomores were entitled to the privilege, given to earlier classes with shorter lessons, of reciting from the book. The phrase "reciting from the book," which constantly recurs in the manuscript literature of the rebellion, is a bit obscure in its meanings to later Yale men, who have been compelled not merely in recitation but in term examinations to recite by the number of the book and figure, and to supply both figure and caption. In a contemporaneous (1830) manuscript of the Yale faculty the expression is explained somewhat nebulously as demonstrating the diagram from the book instead of expounding the diagram separately. An examination of the old text-book, which was the *casus belli,* shows that the diagrams were not inserted in the text, but were on separate leaves at the end of the volume—a sort of appendix. So that probably the real question at issue was whether the class should be forced to draw the diagrams upon the blackboard or not.

The faculty in its earlier statements and before the overt act of rebellion held that the lessons—of about four pages advance and four pages review in Dutton's Conic Sections, now an extinct text-book—were not too long and that the time for covering the subject had not been shortened, but transposed. But these matters, as hostilities advanced, were soon lost in the sterner issue of maintaining discipline.

As was the case five years before, the class of 1832 formed a combination and pledged themselves not to recite from the separate figures. One can look across the gulf of three-quarters of a century and almost see with the eye the hushed excitement at the next recitation, when nine names were drawn from the tutor's deadly box and nine men—tho not quite in succession, for several of the class yielded—deliberately refused to recite. Then the tutor declared the recitation closed, that he had detected clear evidence of a combination and that the nine would be "reserved" for special punishment; and a little later three of the insurgents who were classed as ringleaders were summarily dismissed from the college.

This drastic action of the faculty split the class of ninety-five men into two groups. About one-half submitted, but forty-four, including those under penalty, resolved to hang together. In a printed circular of the time, faded now with age, they give their reasons. In the first place they agree to return to recitation, submit to authority and recite from the diagram, but only on condition that the faculty pardons the members of the class who had been punished. They declare that, in honor, they must stand by the men chosen by lot for penalty when no more guilty than themselves. They ask what propriety or justice there would be if a court should sentence nine pirates to death and turn loose thirty-five others, who had pleaded guilty; to prey upon commerce. They assert also that two of the three

men selected as ringleaders have no title to the name. Next the Forty-four declare that they will stand to the last united in their position and that they have put it beyond their own power—*i.e.*, by oath—to recede, even "tho the clouds of prejudice may obumbrate the intellectual perception in the cold calculations of utility." Finally they declare that, if the Nine are penalized, the Thirty-five left will so break the college statutes as to force an equation of punishment.

The faculty refused to receive a committee of three from the Forty-four and waited seven days, presumptively to give the insurgents time to hear from their parents. Home influence, if exerted, was vain, and the Forty-four were dismissed from college.

So far as the records can be traced, not one of them returned. The Yale graduate of to-day, looking back to that time far past, with all its actors dead, must see in certain heroic outlines that band of Forty-four, each an Ajax defying the academic and parental lightning, and, at an average age probably not exceeding seventeen years, casting their fair names and after careers on the altar of what they deemed undergraduate honor. Even then there were scruples as to the severity of the punishment in the faculty itself, where the records show that two professors dissented from the harsh decree.

The rebellion made a great stir in the academic circles of the time, and there was acute interest as to the policy of other colleges in receiving the mutineers. The letters of President Day and of the elder Professor Silliman, who in those days was a kind of Nestor of the Yale faculty, show much correspondence on the subject. The faculty, as proved by the letters to the powers of other colleges, concede the independent right of those institutions to shelter the insurgents, but, in too covert a fashion, intimate that it would have a bad effect if Yale were not sustained in her action. Rutgers appears to have dissented from the quasi theory of punishment after death, and admitted several of the rebels, and one or two minor colleges seem to have stood with her. But most of the American colleges, in terms less pronounced and expressive, took ground with President Quincy of Harvard, as indicated in the letter annexed:

"CAMBRIDGE, 24th of August, 1830.

"MY DEAR SIR:

"I have received your statement of facts relative to the late difficulties at your seminary. You may rely upon it that there is but one sentiment in the community, and that coincident with the measures of your faculty.

"I have had several applications to know whether the malcontents could be admitted here. Of course, I had but one answer: 'When they brought a certificate that they had taken up their connections in good standing and to your satisfaction, their case might be considered; without that never.'

"Very respectfully,

"I am, your obedient servant,

"JOSIAH QUINCY."

In the year 1879, as the fiftieth anniversary of the class of 1832 drew near, there were eighteen of the Forty-four *disjecta membra* alive, and the class petitioned the corporation that they be granted the M. A. degree, with the usual privilege of enrollment with the class in the Triennial Catalogue. Time had long healed the ancient offense, and the corporation graciously assented. Yet the eighteen names carry the total graduating list of '32 up to only seventy-three in a class which, but for the insurrection, would probably have figured as the largest, save one, in the first third of the nineteenth century. But there were no more Conic Section rebellions. The terrors of sophomore mathematics continued, to reach a climax in the hated biennial examinations of a later decade with their dubious triumphs of "cribbing" and more dubious tales of stolen papers; and the dread horrors of Puckle's Conic Sections reappear in the lines of the old sophomore society song of the sixties:

"Our workday harness now unbuckle,
Demosthenes we give the slip;
'Twixt cup of pleasure and of lip
There rises up no shade of Puckle."

But those archaic woes of sophomore mathematics are now a thing of the past to a new Yale generation, which finds them expunged as a requirement in the elective system.

NEW HAVEN, CONN

Literature

English Literature

THERE can be no doubt about it; the publication of the second and fourth volumes of this pretentious history of English Literature* only confirms the impression produced by the earlier issue—that the work, if critically considered, approaches a failure. To be sure, the emphasis laid in the title on the illustrations makes necessary a large restriction in this sweeping judgment. As a convenient collection of pictures, bringing before the eye the men who have created our literature, together with innumerable curious autographs and other illustrative material, the four volumes are both interesting and useful; altho even here it must be noted that not a few of the reproductions (*e.g.*, the portraits of John Speed and Cooke in Vol. II) are unpardonably bad. But, after all, it is as a written record and criticism of English Letters that the work must be judged; and it is, moreover, perfectly fair to take into account the bulk and cost of the books in such a judgment. As a cheap, popular work (the text might all be printed in two comfortable octavos) it would meet with general approval; costing twenty-four dollars and weighing in avoirdupois not far from twenty-five pounds, it makes claims that demand a more stringent estimation. Our quarrel with it, in brief, is simply this, that we come to it expecting a work of authority and distinction, and are put off with something not above mediocre.

As in the first volume, Mr. Garnett's present portion of the task, extending from the accession of Elizabeth to the death of Shakespeare, is performed with a certain solidity of effect which is somewhat calculated to disarm the caviller. One may point out as particularly clear and judicious the discussion of that still vexed question, the W. H. of Shakespeare's Sonnets. Indeed, in the presentation of such matters Mr. Garnett usually shows a well poised mind and a well trained hand. Yet even in this section of the book there is a good deal that is unsatisfactory. As everywhere in the volumes, the arrangement, with its diversification of types, tends to become freakish. Why, for instance, separate the treatment of Lodge's prose and verse, when in Raleigh the two are grouped together? Mr. Garnett is a man of genuine scholarship and enormous reading, but we observe, as in his earlier work, a tendency at times toward irrelevant allusion that touches pretty closely on pedantry. So, too, in the treatment of Spenser his comparative criticism would have been stronger if he had confined himself more closely to Ariosto and said less of Tasso and Camoens, with whom Spenser had so much less in common. Indeed, the whole effect of this study of Spenser is diffuse and feeble—and there was such an opportunity of doing something really worth while.

Mr. Gosse, to whom is due half of volume II and all of volume IV, as always, has written gracefully, with occasional passages of real felicity. His remarks now and then are capital for point and justness; but, taken as a whole, his work here, as before, cannot escape the charge of mediocrity. The damaging question will not be laid: Is there anything in these pretentious volumes that could not readily be got in more accessible and convenient form? Even when rising above mediocrity, his manner too often leaves the mind dissatisfied. But it is only fair to quote an example of this fault:

> "For all his excessive attachment to revolutionary ideas, Shelley retains much more of the age of Gray than either Keats, Coleridge, or Wordsworth; his style, carefully considered, is seen to rest on a basis built about 1760, from which it is every moment springing and sparkling like a fountain in columns of ebullient lyrism. But sweep away from Shelley whatever gives us exquisite pleasure, and the residuum will be found to belong to the eighteenth century."

That we are inclined to reckon one of the most original *aperçus* in the two

* ENGLISH LITERATURE: AN ILLUSTRATED RECORD. *By Richard Garnett and Edmund Gosse. Vols. II and IV.* New York: The Macmillan Co. $6.00 a volume.

volumes, and, apart from the somewhat overblown rhetoric of the language, we are further inclined, tho hesitatingly, to accept it as good criticism. Our dissatisfaction arises from the light way in which so essential a matter is dismissed; a serious history of literature should have paused to discuss so questionable a theory.

Elsewhere Mr. Gosse falls into a method that is either totally inadequate or misleading. Thus, the scant treatment accorded William Browne is nothing less than absurd, when one considers the indirect influence of Browne on modern writers through Keats. One expects under Quarles something more than the mere mention of his "Emblems." And it is scarcely judicious to sum up Carlyle by saying that "we are beginning now to admit a voice and nothing more, yet at worst what a resonant and imperial clarion of a voice!" After all, the wisdom of our fathers is something more to us than *vox et præterea nil.*

Elizabeth in Ruegen.

THE most marked characteristic of Frau Elizabeth is her desire to get away from people and to take the whole reading public into her confidence in expatiating on her love for solitude. Even the patient "man of wrath" and those adorable infants whom the irreverent have dubbed the "March-hare baby," the "April-fool baby" and the "June-bug baby," are only endurable for brief periods. If she ever invites us to her ancestral country seat in Pomerania (ancestral on her husband's side), we shall decline, because she would write a book telling what bores we were.

In this book* the narrative thread is the effort of Frau Elizabeth to escape from four persons whom the reader, on the contrary, finds exceedingly interesting. The German professor, who does not take his wife seriously enough, and Cousin Charlotte, who, being a new woman, takes everything seriously, even her professorial husband; the wife of the English bishop and the Oxford boy; perhaps we should also add the coachman and the imperturbable Gertrud—all these chase one another about the island of Ruegen through the various summer resorts in the most amusing fashion for ten days. It is a delightful trip, much pleasanter than going to Ruegen in person, for the ordinary person has not the Frau Elizabeth's eye for the picturesque in nature and the grotesque in her fellow-beings. It does not rain till the middle of the book, and then only enough to make it interesting, and the mosquitoes do not stick their bills into the story in any obtrusive manner, so it differs decidedly from the usual summer resort story or the usual summer resort itself.

As all geographical romances should, this volume has a map for the benefit of those readers whose knowledge of Rügen is hazy with the mists of the Baltic. As a proof that the island was really circumvectated by Frau Elizabeth there is a red line showing her route.

Like all her other books, this one is not written in plain black ink, but with pastels. It overflows with the colors of forests and sea and sky, and these change with her mood. The chameleon takes the color of its surroundings: Frau Elizabeth tints the whole landscape with her emotions. We shall never go to Ruegen, for it would inevitably be disappointing.

A Romance of a Dogma

WHAT would be the effect on the world if an inscription should be discovered in Jerusalem reading, "I, Joseph of Arimathæa, took the body of Jesus, the Nazarene, from the tomb where it was first laid and hid it in this place"? According to Mr. Guy Thorne* the result would be an instantaneous outbreak of crime and brutality all over the world. Anarchy would take the place of government; women would be maltreated and enslaved; the Turks and the pagans would overrun Europe as they did in the Middle Ages. Nobody would be happy except the Jews, the Mohammedans and the Unitarians, and they not for long. The Catholics, who are forbidden to read about the discovery, and the Churchmen who know it is a forgery by the evidence of their inner consciousness, are the remnant who save the world.

* THE ADVENTURES OF ELIZABETH IN RUEGEN. *By the Author of "Elizabeth and Her German Garden."* New York: The Macmillan Company. $1.50.

* WHEN IT WAS DARK. *The Story of a Great Conspiracy. By Guy Thorne.* New York: G. P. Putnam's Sons. $1.50.

The importance of theological dogma has probably never been more strongly asserted in a work of fiction, and to most readers it will seem grossly exaggerated. When we remember that the dogma in question was rejected by a large part of the early Christians, that it is denied by some sects at the present time, and disregarded or ignored by a large proportion of the members of all denominations, who are not noticeably inferior in morality to their more orthodox contemporaries, there appears to be little ground for thinking that the consequences of dropping one clause of the Apostles' Creed would be so immediately disastrous as the author believes.

The style of the book is a close imitation of that of Marie Corelli. Many of the characters are portraits, those of Premier Balfour and Mrs. Humphry Ward being especially prominent. Every time American politics is alluded to ludicrous mistakes are made.

Parsifal and the Grail

THE search for the Grail did not cease with the disbanding of King Arthur's Order of the Round Table. It is still carried on with the same eagerness in our own day as in the days of chivalry, tho now by scholars instead of knights, who search through the literature of all ages and languages in hopes of finding in some out of way place and strange disguise that magic vessel which in the course of history has been the receptacle of so many different ideas. Nor is the story of this literary quest less interesting than that of the Middle Age. On the contrary, we find either Kufferath* or Tunison† more enjoyable and exciting than Sir Thomas Malory. To trace back the genealogy of a legend such as this is not easy, for its ramifications extend through the field of poetry, theology, history, drama, music and mythology. The German courts have decided that it is libelous to accuse Herr Conried of the "Theft of the Grail," and, as for the group of legends associated with it, they have passed through so many hands as to be quite common property.

Wagner's dramatic poetry, like his music, is lacking in simplicity and unity. Like that kind of stained glass which is made by throwing into the pot small pieces of all sorts and colors of glass and heating them until they fuse together, but not enough to lose their identity, so in the making of his music dramas Wagner never completely melts together the glittering fragments of legendary lore he collects. Compare his use of the Arthurian legends with that of Tennyson. Tennyson's poems are symmetrical and pellucid to a fault, and he might have been the originator of characters and incidents he uses, so far as one could tell by internal evidence. Wagner's "Parsifal," on the contrary, is chaotic. It contains many parts that are not significant, and allusions that are not comprehensible, except to scholars, and not always to them. In appropriating for his own use the themes and characters and incidents of older poets he retains much that in its new setting is meaningless and impertinent. "Parsifal" reminds one of a Roman church built from pagan ruins, wherein one recognizes a pillar from a temple of Minerva, and on the base of the altar stone catches a glimpse of a bacchanalian bas-relief. Parsifal, Kundry, Klingsor, Gurnemanz have in their time played many parts. The spear, the banquet, the enchanted castle, the kiss of enlightenment have meant very different things. The Holy Grail has not always been holy nor even a cup. In one of its previous states of existence it was the magic stone of the Arabian legends.

It is curious to see how patriotic prejudices enter even into such a field as this "Science of Fairy Tales." The French accuse Eschenbach of distorting the legend he borrowed from their country. English authors talk mostly of Walter Maps, and the Germans slight Chrétien. Kufferath's *Parsifal* gives a very comprehensive account of the Wagnerian opera and the sources of the material of which it is constructed. The quotations from Chrétien's "Perceval," which has never been completely translated into

* THE PARSIFAL OF RICHARD WAGNER, WITH ACCOUNTS OF THE PERCEVAL OF CHRETIEN DE TROIES AND THE PARZIVAL OF WOLFRAM VON ESCHENBACH. *Translated from the French of Maurice Kufferath by Louise M. Henermann. With the Leading Motifs in Musical Notation and Illustrations of the Scenes at the Metropolitan Opera House.* New York: Henry Holt & Co. $1.50.

† THE GRAAL PROBLEM: FROM WALTER MAP TO RICHARD WAGNER. *By J. S. Tunison.* Cincinnati: The Robert Clarke Company. $1.25.

English, are here rendered in fairly smooth but not very literal verse.

Tunison's *Graal Problem* is a small but scholarly book, of which the chief contribution to the literature of the subject is the study of the influence of ecclesiastical dogma on the form of the grail stories. Very likely this is exaggerated, but some interesting points are emphasized. We are willing to go as far as any one in the fascinating pastime of tracing the derivation of names, but we refuse to accept Mr. Tunison's theory that *Flegetanis* is merely a corruption of *Retines.*

Mr. Haweis's *Parsifal,*‡ reprinted from his "Musical Memories," gives his interpretation and personal impressions of the opera as given in Baireuth. It gives in brief just what the ordinary person wants to know before seeing it.

China's Book of Martyrs. By Luella Miner. New York, Boston and Chicago: The Pilgrim Press. $1.50 net.

The author tells a thrilling story of the martyrdom of thirty thousand Christians in China. It is in the form of narratives, testimonies of the dying and experiences related to Miss Miner during the siege of Pekin and an ensuing year's residence in Cathay. The compiled statements prove unquestionably that the Boxer uprising was waged more for politics than religion. Their war cry, *Shaerh-maotze,* could not be interpreted "Kill Christians;" it meant the extermination of foreign devils, who were stealing China. The centers of massacre were Pekin, Tung Chow, Pao-ting-fu, Tientsin, Kalgan, Tsu Hua, K'ai Pung and the Manchurian villages. Deep impression was made upon missionaries and other foreigners by the dignity and courage with which the natives met death. Putting aside the natural feeling which all have for self-sacrifice, it must be confessed that the strongest characteristic of the Chinese races has been their willingness to die for a cause they believed in. Gratefully they give their lives for father, brother or son, and Cathay is believed to be the only country where an unmarried innocent man may voluntarily receive the knife for the condemned criminal, a married man with family. Christianity has added luster to this racial virtue of self-sacrifice. During the plague riots at Canton the lives of women missionaries were saved by their Chinese converts, most of whom were secretly murdered for their deeds. Account of the Boxer revolt is not given in detail, the pages being devoted to the tragedies of the victims. The stories of the beggar-boy, the old rag-picker and the Jesus Church Bible woman will place the Chinese people in better light before the world than whole sets of encyclopedias and volumes of diplomatic letters. These plain people together with native pastors and students carried messages to Tientsin, worked in the trenches, made sandbags and undertook the most dangerous exploits to relieve the besieged city of Pekin. Wherever foreigners were led forth to execution their faithful converts shared death with them, tho offered life for recantation. Several cases are recorded where fathers and mothers were dispatched first, and when the time for the children came, the faithful Chinaman clasped them in his arms and died with them. Not a cry of the missionary child for a comrade in death was left unanswered. The testimonies seem a repetition of scenes in the French Revolution, when a nation's chivalry rose to the climax at the mouth of the grave. The elaborate funerals given the martyrs when peace was declared is pathetically alluded to, but happily in good taste; the revenge of Russian soldiers for Christian persecution is lightly dealt with. The book is a memorial and plea for the Chinese Christians, and any thought of literary effort is swallowed up in the mere recital of the sufferings of yellow humanity in the summer of 1900.

The Passover Service. For Passover Eve in the Home. Arranged by Mrs. Philip Cowen. New York: Philip Cowen.

This is a paper-covered booklet of 107 alternating pages in Hebrew (or Aramaic) and English translation, giving the full service for Passover; and very religious and interesting it is to a Gentile, and very useful to a Jew, especially because of the improved translation into good English. We observe that the trans-

‡ PARSIFAL: STORY AND ANALYSIS OF WAGNER'S GREAT OPERA. *By H. R. Haweis.* New York: Funk & Wagnalls Company. 40 cents.

lation of the Psalms follows substantially the Common Version, but with some variations. After the solemn service is ended there comes the more amusing part for the children who have kept awake for it. These are the numbers repeated:

"Who knows one?

"A. (By children.) I know one. One is our God who is over heaven and earth.

"Who knows two?

"A. I know two. Two are the Tables of the Covenant; but one is our God who is over heaven and earth."

Then follow the other numbers up to thirteen. Three are the Patriarchs; four are the Mothers of Israel (Sarah, Rebekah, Leah and Rachel), and so up to the thirteen attributes of God. And each answer goes back and repeats all that have gone before. And, finally, comes the singing of the song, "One Only Kid," which father bought for two *zuzim*. But the cat ate the kid, and the dog bit the cat, and the stick beat the dog, etc., all repeated after the old way we all know. But the beauty of it is the interpretation: The kid is the chosen people; the two *zuzim* are the tables of the law; the cat is Egypt; the dog is Assyria; the stick is Persia; the fire is Alexander; the ox is the Roman Empire; the butcher is the Moslem power, after which will come the angel of death to kill the butcher, and then will appear the Holy One, who concludes the story in a more pious way than we had learned it from Mother Goose.

The Direct and Fundamental Proofs of the Christian Religion. By George William Knox. New York: Charles Scribner's Sons. $1.20 net.

It is fitting that a Yale lectureship should bear the name of Nathaniel William Taylor, and the first course of lectures, delivered by Professor Knox, of Union Seminary, in the winter of 1903 is a worthy memorial of the great leader of the "New England Theology." Dr. Knox was heard by large audiences at Yale last winter, and his lectures demonstrate that a new apologetics, based upon the modern view of the world, is possible, and also may be made helpful and stimulating. The title of the lectures is a phrase from Butler's Analogy. To Bishop Butler the "direct and fundamental proofs of the Christian Religion" were miracles. To Dr. Knox they are the religious teachings and the ethical ideals of Jesus. Those teachings and ideals are facts before us, and in the records of Christianity and in the lives of Christian men they challenge our attention. We find they satisfy our religious cravings; they are the response we need to our religious nature. The ethics of Jesus, rightly interpreted, are the only practical map of life.

"It is not the teachings of Christ which are impracticable, but their rejection, making nations armed camps, and leading each to legislate with sole regard to its own supposed interests."

The moral ideals of Jesus and his truths of God and the soul are positive forces, actually at work in the world. They live as ideals and inspirations in the hearts of many men. Now these ideals are our estimates of worth, dream landscapes which we believe in with all our soul and which we work to realize. Thus the Christian faith answers the test of reality by its correspondence to an established order of facts, an order established not as yet in the world of things, but in the hearts of those who are competent to judge, the men of faith. Thus the direct and fundamental proofs are found in the quality of the religion itself, in the life of Christ, the self-sacrifice in which He died, and the ethics which his spirit embodies. The argument thus unworthily condensed is enriched by illustrations from the conflict of Buddhism and Confucianism in China, and thus the essay bears not inaccurately its sub-title, "an essay in comparative apologetics." It is common to say that present-day apologetics are of no value because men no longer occupy the ground on which the apologists stand. This cannot be said of the essay of Dr. Knox, and on the new ground and from the modern view of the world he has made a worthy defense of fundamental Christian convictions.

A Manual of Coaching. By Fairman Rogers. Illustrated. Philadelphia: J. B. Lippincott Co.

The popularity of coaching for a pastime has for a long time been very great in England. Its enjoyment is necessarily limited to persons of easy circumstances,

but the pomp and circumstance of coaching lend to it much that is spectacular which always mightily appeals to a certain class. Coaching has obtained a moderate foothold in this country, and the present book will be quite interesting to those who are beginning to feel something of its spell. Some history of the development of the coach appropriately opens the volume. The distinction between the coach and a drag is made clear. The coach parts and accessories are described, as well as the coach variants. Something is said about American coaches. The whip and its use is deftly touched upon, and so is the harness and the appropriate coaching attire. The author tabulates the rules of the road and incidentally mentions accidents that will happen in coaching in spite of all care. A couple of pages are devoted to coach calls on the horn, and some interesting coaching medals or tokens are figured. The manual is well made up and the material in it is discriminately chosen.

Tennessee Todd. By G W. Ogden. New York: A. S. Barnes & Co. $1.50.

The test of an author's genius is his ability to create a natural situation, and to interpret the types that belong to it with sufficient dramatic power to produce the effect of real life. In such a writer an immaturity of style may be easily pardoned if he is a literary novice, but it must be condemned as a lazy ugliness if it comes from slovenly habits of thought. Now, Mr. Ogden's story is so refreshingly told, gives such an incisive impression of life and conditions along the mud banks of the Mississippi River, that we are disposed to attribute his purely literary faults to a lack of experience in managing some of the mechanical effects so necessary in securing correct artistic proportions for any work of fiction. The plot of the story grows out of the struggle between the steamboat lines on the Mississippi and the young railroads that crawled down through the rich river valley after the Civil War, grasping the land, traffic and every form of industry with a thousand tentacles. But the most engaging figure in the story is that of "Tennessee Todd," the pilot's daughter. It is scarcely an exaggeration to say that this girl is a new and significant character in the year's fiction. It is not unusual for an author to metamorphose some woman belonging to the class known as "pore white trash" into a creature of wit, beauty and culture. This is a trick of the imagination easily accomplished; but in the character of "Tennessee Todd" Mr. Ogden achieved a more difficult task. She is not idealized, but illuminated by a passion that casts a red glow into the sullen darkness and upon the heroic stupidity of her silent, primitive nature. There are other notable characters in the story, but this woman is a revelation of her savage feminine kind, who compels admiration even while she excites social repulsion. The book deserves to attract especial attention in St. Louis and New Orleans, which may be called the two freight depots of the author's imagination.

The Little Chevalier. By M. E. M. Davis. Boston and New York: Houghton, Mifflin & Co. $1.50.

Since the historical novelist has made himself a sort of literary second for every authentic or imaginary duelist in history, we have had a bloody season in fiction. But it is a mistake to suppose that all the changes have been rung upon this romantic sword practice, for the author of *The Little Chevalier* has at last passed the limit where she makes a French girl living in New Orleans during the eighteenth century one of the principals in a duel with a young vicomte. The reason for the duel and the results make a pleasant tale sure to entertain Mrs. Davis' friends in New Orleans; but the duel itself is the distinguishing feature of the novel, since before this time not even the historical romancer has created a situation so preposterous as this, where a woman in breeches, with pretty "wrists of steel," defends a dead father's honor upon the bloody sands.

A Touch of Sun. By Mary Hallock Foote. Boston and New York: Houghton, Mifflin & Co. $1.50

This volume of short stories vary in merit and interest, but they convey some intimations of why life in the West is so unconventional. Even sentiment is topsy-turvy, because the emotions are harassed by the natural scenery, threatened by the desert, challenged by the mountains.

Thus the advent of a woman means to the dusty hermits of that region one form or another of romantic insanity. They are in no condition spiritually or mentally to practice the arts of refined courtship. They have a bushwhacking temper and a strident energy in the making of love, very shocking to the sensibilities of the young lady, who is invariably imported, shirt-waists and all, from the East. But the author manages the situation with a courage and barbaric decision that is refreshing.

A Kidnapped Colony. By Mary Raymond Shipman Andrews. New York: Harper & Brothers, $1.25.

The plot of this story has the merit of some novelty, but not that of probability. In these days of speedy communication it is difficult to imagine a British colony, especially a military post, being ruled by an impostor—and an American impostor at that—even for a few days. The punctilious formality of the diplomatic, consular and colonial service of governments in receiving and presenting credentials is jauntily ignored in *A Kidnapped Colony;* the impostor lands and instantly proceeds to govern Bermuda as tho vice-governors *ad interim* and credentials had no place in colonial service. Why must the American promoter abroad necessarily be vulgar tho kind? It has become almost a chronic habit to portray the traveling American capitalist as a vulgarian, and as one whose speech betrays the deficiency of even the most rudimentary education. The type has been exploited inordinately in both fiction and plays. Are there no American business men of education and refinement? And why must the American promoter, who has the intelligence to grasp large problems and put through great business ventures, be made to talk like a combination of rustic and Bowery boy? Why, also, must he inevitably hail from Oshkosh? Oshkosh, we think, has been punished enough, and we yearn for a change. Do waves look dark in a "red-and-orange sunset?" They might through shaded goggles, but it is hardly conceivable that the eye not color-blind could attest this singularity. This, occurring in the opening lines of the story, is a specimen of the author's carelessness at times. It is certainly all of the "touch-and-go style" that the publishers advertise for the work, tho the claim that "it gives charm and vivacity to the tale" might well be questioned.

The Life and Principate of the Emperor Nero. By Bernard W. Henderson. Philadelphia: J. B. Lippincott Co., $3.00 net.

This is an "endeavor to restore the Emperor Nero from his position of terrible isolation as the Abomination of Sin upon this earth into the ranks of a common humanity," and seems to be based on the idea that, despite all that has been written concerning that rather unpleasant potentate, he is still the "figure of medieval legend." Readers of ample leisure with a taste for delving into masses of irrelevant padding may find that the author has somewhere said something new on the subject. We have not encountered it. The best part of the book is the bibliography at the end.

Stella Fregelius. By H. Rider Haggard. New York: Longmans, Green & Co.

We read that Orpheus charmed Eurydice back from the gates of death—a myth that fascinates even modern unbelief. Some such fascination clings to this romance, which is the story of a living lover who succeeds in getting his dead sweetheart to appear to him again. But the solid, homely English details woven into the story make it, at times, absurdly funny, tho to create this effect lies very far indeed from the writer's intention. It is as if a ghost should appear in Piccadilly, in a cab, wearing a monocle and munching a bit of beef.

Shakespeare's Homeland. By W. Salt Brassington, F.S.A New York: E. P. Dutton & Co., $2.50.

Pilgrims to Stratford could desire no fuller assistance than is given them by this elaborate and beautifully illustrated volume. Its author's zeal has led him to make unwearied research not only in Shakespeare's town itself, but in the whole of the countryside. The book, however, is not a mere companion to the map of Warwickshire, but offers many facts of service to the Shakespeare expositor. It is therefore of literary interest, tho its primary value is antiquarian.

Getting a Living. The Problem of Wealth and Poverty—of Profits, Wages and Trade Unionism. By George L. Bolen. New York: The Macmillan Co. $2.00 net.

Mr. Bolen's book has many of the familiar marks of a work intended for paternalistic distribution. The labor-unionists and radicals would appear to be getting troublesome, and therefore to be in need of wise counsel from above. We doubt not that some benevolent national association of employers will accept the book for gratuitous circulation among those who are supposed to need its teachings. There are 762 pages of it, and all of them are devoted to the task of proving that the present industrial order is about the best possible in the best of all possible worlds. The social reformers and labor-unionists are, it is admited, flaws in the general perfection; but they may be corrected or eliminated. The labor-unions would appear to be a pretty bad lot. "For intolerance and tyranny," writes the author (p. 645) "no other force now appears in civilized lands that approaches unionism." Violence is their main weapon, too, and their members are fully aware of it, as the following "childlike and bland" argument (p. 555-6) will show:

> "The resentment aroused among unionists in 1893 by Judge Jenkins's assertion that 'no strike can be effective without compulsion and force,' must have arisen from the element of truth in his assertion, since if it had been wholly and clearly untrue denial would have been unnecessary and excitement over the matter unlikely."

Some merit is seen in child-labor laws, but, on the whole, the checking by the courts of labor legislation is desirable (p. 545). The author's uniform and undiscriminating praise of court decisions will need revision in a second edition, the Federal Supreme Court, in the Kansas eight-hour case, having rudely shattered some of his arguments. As for the alleged abuse of injunctions in labor disputes, the author has been unable to discover it. Rather he fears that the judges have been too lenient in punishing contempt (p. 569). Even the assumption of divine vicegerency in industrial control is sanctioned. "Mr. Baer's divine right of private ownership, tho it answers well to declaim against, is found after all to have a basis disconcertingly sound" (p. 754).

Austro-Hungarian Life in Town and Country. By Francis H. E. Palmer. New York: G. P. Putnam's Sons, $1.20 net.

There is no other European country of equal importance of which so little is known in the United States as Austria-Hungary, notwithstanding the fact that it has contributed so largely to our population, especially in the mining regions. The hazy ideas of most Americans on the characteristics of the numerous races which go to make up this heterogeneous empire make such a book as this very welcome, altho it is neither profound nor brightly written. The author passes in rapid review the customs and costumes, the language and political life of Magyars and Austrians and the minor nationalities associated with these dominant races. In our opinion the author has made a slight mistake in saying the Hungarian farm laborers are classed as *béres* and *betyars*. *Betyar* means loafer, and if you should apply such an opprobrious term to a laborer it would probably result in his ceasing to be a laborer, at least in your employ. Perhaps *buytár* is the word meant.

Merely Mary Ann. By I. Zangwill. Illustrated by scenes from the play. New York: The Macmillan Co. Paper, 50 cents.

It was a curious lapse of taste which led Mr. Zangwill to give "The Grey Wig"—which is rather of a dull sketch for him—the leading part and title-rôle of a collection of stories containing so original and charming a personage as *Merely Mary Ann*. But concealed as she was under the grey wig, she was speedily discovered, and people persisted in asking the librarians for the "Mary Ann book," and so caused the publishers to release her from her uncongenial surroundings. Like many other girls in modern novels, she has taken to the stage, fortunately in this case without losing her character. Eleanor Robson has given a real interpretation and development of the character, and no one who has fallen in love with Mary Ann of the story need fear to see the play. In books and plays and real life nowadays it is rare enough that we find a woman who is "merely" lovable, teachable and honest.

Literary Notes

"Who's Who in New York City and State" (L. R. Hamersly Company, New York) follows closely on the lines of previous publications covering wider territory, and like them is useful for addresses and biographical data. We have looked in vain to find in it half a dozen names which certainly should be in such a book, but such disappointments are to a certain extent inevitable.

....Those who wish to form some acquaintance with the mystical philosophy of Lao-Tze, the rival of the ceremonial and materialistic ethics of Confucius, will find most useful the extracts from the Tao Teh King, published by the Open Court Publishing Company (Chicago) as No. 55 of the Religion of Science Library (25 cents). No. 54 of the same series (50 cents) contains St. Anselm's theological works.

...."The Record of a Family" (G. P. Putnam's Sons, New York, $2.50) contains spaces for those dates, weights, notes and measurements of children which parents so commonly begin to record with their first child, but which are usually allowed to lapse after a few years. This volume has space for such data for five children, from birth to maturity, with statistical tables by which the conscientious parent can see if his children are getting teeth, measles, vaccinated, schooled, engaged and married at the proper time of life.

....We have recently received the following new volumes of the Temple Series of Bible Characters and Scripture Handbook: "A Prince of Old Testament History," by the Rev. O. R. Barnicott; "Abraham and the Patriarchal Age," by Rev. Professor Duff; "Joseph and the Land of Egypt," by Prof. A. H. Sayce; "Joshua and the Conquest of Palestine," by Rev. W. H. Bennett; "The Religions in India, Brahmanism and Buddhism," by the Rev. Allen Menzies. These are published by Lippincott at 40 cents in cloth, and since they are both scholarly and readable, they are useful for Sunday School work in many ways.

Pebbles

A LIST FOR LIBRARIES.

Not to be behind other periodicals of the day we have prepared the following annotated list of the most important books relating to Japan, China and Russia. Of course, every Carnegie in the country has the standard works, such as "The Muddle Kingdom" and "Korea: The Land of the Morning Clam" and "Bird-Tracks in Japan." The material on the period of the Boxer rebellion is also abundant. All the foreigners who were in the siege of Pekin kept diaries, and most of them found publishers. The public libraries at that time laid in cords of such books as "China in Disorder," "China Out of Temper," "China Moulting," "China in Conniptions," "The Smash Up of China" and the opposing volume to this, "China Not What It is Cracked Up to Be." On Japan we have a number of such scholarly works as "Hurrah for Japan," "Japan Awake" and "Japan Rubbing Her Eyes." "The Land of the Rising Chrysanthemums, by One Who Has Been There" (3 vols., $15 net), is of especial value, because the author was on board a ship which stopped for three hours in the harbor of Nagasaki and observed the island closely with an opera glass. "The Heart of Japan with an Appendix on the Liver," is also noteworthy. "Mesdames Cherry-blossom and Mosquito," is by an author who went one better than other students of social life, and married two Japanese wives, which enabled him to get a remarkable insight into their domestic charms. This, together with "Gay Geisha Girls," the careful librarian will place it in Class Q. "In Prohibited Hongkong" (2 vols., $18) is by the only white man ever allowed to live in the city, which he penetrated disguised as a Standard Oil drummer. The probable site of the great land battle of the war is described in "From Antung to Wiju" by one who made this difficult journey in person, with his kodak going like a kinetescope all the time. "China: the Land of Confusion," is a work we heartily commend. (Other publishers can have their books commended with equal heartiness on the same terms.) Attention should be called to such biographies as "The Great White Feathered Czar" and "The Dowager Impress of China," and such important poems as "Haddem Bad; the Bear That Walks Like a Russian." Such books on Russia as the following are too well known to need more than mention: "The Knout and the Knouted," "Pacific Russia," "Sighs from Siberia; or Life Among the Exiles," "Ker-Choo: the Land of the Falling Thermometer," "How I Boxed with the Boxers and Cosseted the Cossacks." Through the courtesy and prescience of the publishers, we are able to announce some forthcoming works: "Russia Japanned," "The Rising in the Yeast," "The Yellow Peril or the Mongol Weights," by Reise Kaiser, and "The Yell-Oh-See," by Admiral Alexieff, and "Where Is the Japanese Army? a Problem Play," by Kuropatkin. The present Czar, when he was only a 'vitch, traveled in Japan, and is expected to write a book on "How I Tripped Over Japan." The gifted authors of "Lethergo Gallegher" and the "Call of the Wild Sea Wolf from the Abyss," have been sent to the front, as they deserve to be, and we may expect books from them equal to any of their previous works of fictior

Editorials

The Merger Decision

THE Supreme Court has decided that the Northern Securities merger was made in violation of the Sherman act; but the decision was reached by a bare majority of the Court, a majority depending upon the adhesion of Justice Brewer, whose separate opinion is the most important and significant part of the record in this memorable case. If Justice Brewer should go over to the minority in any similar case hereafter, the minority would become a majority. His separate opinion leaves him perfectly free to do so. He had been with the majority, he said, in the four preceding decisions, and did not regret his action; but he thought the prevailing opinions in those cases went too far. Instead of holding that the Sherman Anti-Trust act included all contracts, *reasonable or unreasonable,* in restraint of interstate trade, the ruling should have been that the contracts then under consideration were unreasonable restraints of such trade, and therefore within the scope of the act.

"Congress did not intend by that Act to reach and destroy those minor contracts in partial restraint of trade which a long course of decisions at common law had affirmed were reasonable and ought to be upheld. The purpose was rather to add a statutory prohibition which prescribed penalties and remedies to nullify those contracts which were in direct restraint of trade, *unreasonable* and against public policy."

It may be inferred that in any case coming before the Court hereafter, under the Sherman act, his vote will be cast for the defendant if, in his judgment, the restraint in question has not been unreasonable and against public policy. The restraint in this case was, to his mind, clearly unreasonable.

Altho the Government apparently seeks to confine this decision to a condemnation of the holding company as a device designed to evade the law, it seems to us that under Justice Harlan's (the prevailing) opinion there are other illegal combinations in the railroad world. Notable examples of the virtual consolidation of parallel and naturally competing lines could be cited. It may be that in one or two instances there ought, in the interest of the public good, to be prosecutions like this one against the consolidation of two parallel lines between the Lakes and the Pacific. In other cases, however, prosecution would serve no good purpose. Original conditions could not be restored. If they could be, the public would not gain by a forcible separation of parts so long united.

We presume that if such cases should come before the Supreme Court, Justice Brewer would hold that the restraint of trade in question was reasonable and in accord with public policy. His attitude would acquit the defendants. Possibly it is because this is foreseen, as well as for the reason that a prosecution of such consolidations or combinations is not required for the public good, that Mr. Knox expresses the disinclination of the Government to "run amuck" in an assault upon all railway companies that may seem guilty, under Justice Harlan's opinion, of a technical violation of the statute.

This suit served to check a formidable movement for the consolidation of the railroads of the United States. Prevailing prosperity and very active speculation in securities, together with a remarkable movement for the grouping and consolidation of manufacturing industries, suggested and stimulated the attempts of a few powerful capitalists to gain control of all the railways. Other holding companies were to follow this one or to be associated with it. The success of these attempts, provided that the Government should not interfere, could easily be foreseen. The Government did interfere. Plans for further consolidation were laid aside or held in abeyance. So far as they resembled the machinery of this merger they are no longer available.

During this interval of waiting and inactivity on the part of the consolida-

tors the condition of business and speculation has undergone a change. The situation is not now favorable to the conception and execution of new plans for completing the railway groups and combining them by community of interest. But we may be sure that these great projects of our railway capitalists have not been given up. At a more favorable time the movement for consolidation, checked by this suit, will be seen again. Further consolidation can probably be accomplished without exposing the parties, under existing law, to hostile decisions of the Court. This is indicated by that part of Justice Brewer's opinion which relates to the acquisition of control by the purchase of stock.

It should be borne in mind that the tendency, in time of prosperity, is toward the consolidation of the control of all our railways in the hands of a few men. This tendency can be retarded in various ways, but not wholly overcome. It calls, not for a rigid and narrow enforcement of this Anti-Trust law, upon the lines of the prevailing opinion in this case, but for the supervision and regulation of rates by a Railway Commission of eminent ability and large powers. Unless the railways when consolidated shall be subject to such authority, the popular demand for Government ownership and operation will become irresistible.

It will be observed that all the Democratic Justices of the Supreme Court were in the minority, opposing the majority's enforcement of the statute against this Railway Trust. For this reason, and on other accounts, it will be difficult to make an effective use of the Trust issue for the advantage of the Democratic party in the coming campaign. Prominent Democratic journals admit that President Cleveland's Attorney-General, Mr. Olney, regarded the statute with much disfavor and was disinclined to make any use of it. On the other hand, the Democratic demand that Mr. Roosevelt shall now proceed against other combinations of parallel railroads is one that is not easily met by refusal. As we have said, in a majority of instances prosecution would be distinctly contrary to the public interest and would probably be made futile by an opposing majority in the Supreme Court.

As for attempting to enforce the statute against industrial Trusts or incorporated combinations of manufacturing concerns, the previous decisions of the Court seem to bar the way, unless the industrial combination controls and operates an interstate railway in connection with the business of production. The complications of the question from a political point of view are increased by the fact that a Republican Congress declined to adopt the amendments, suggested by Attorney-General Knox, that would have made the statute available for use against industrial combinations. On the other hand, the law itself was enacted by a Republican Congress, and nearly all the attempts to enforce it—notably this latest one, in the case of the Northern Securities merger—have been made by Republican Administrations.

The Sherman Anti-Trust law was not designed to be used against combinations or associations of railway companies. Enacted in 1890, when the growth of what were then properly called Trusts was beginning to excite popular hostility, it was aimed exclusively at industrial combinations. A few tests showed that these were beyond its reach; but, to the surprise of the authors of it, the statute was found available for the prosecution of railway companies, which they had not sought to attack. In this Northern Securities merger case it has been useful; but an enforcement of it in every instance of a suppression of railway competition would be injurious. If it must be applied to railways, then it should be amended in the manner suggested by Justice Brewer's opinion. A restraint of trade that is neither unreasonable nor against public policy should not be prohibited. The remedy for such evils as exist in the railway world lies not in a forcible disintegration of all the companies or systems that embrace parallel lines—some of them acquired many years ago—but in an effective supervision and regulation of rates by Federal authority. Logically, under the recent decision, many railway companies are violating the law and should be prosecuted. The Government will be unjustly censured for declining to prosecute them. It may reasonably ask to be freed from undeserved censure

by legislation that shall adapt the railway laws to the just requirements of the railway business.

How to provide for the proper restraint of great combinations of manufacturers is distinctly another question. For this the Sherman act is practically useless. The amendments suggested by Mr. Knox were ignored by the Senate, and appear to have lost the support of the President. The problem might be solved if the power to incorporate and to supervise what is incorporated were vested exclusively in the National Government. Until such a change shall be permitted by the States, the evils of Trust promotion, the excesses of Trust corporations, and the growing concentration of corporate wealth will tend to increase the number of those who see in public ownership a remedy for many real or imaginary ills.

A Good Old Way

THERE is such a thing as progress, despite the amiable cynics and the unamiable growlers, but progress is not a uniform advance of mankind in civilization and well-doing; and sometimes the gains that a generation has made are lost and forgotten in the struggle of posterity to achieve something new.

The American people are on the whole justified in believing that their political constitution and plan of government are superior to any other that has as yet been tried among men. There are regions within our national domain where lawlessness is all too common. There are inequitable privileges enjoyed by the powerful to exploit the weak. It is doubtful whether, when all the petty acts of paternalism which our State legislatures love to indulge in are taken into account, the individual American has at the present time as much personal liberty as the Englishman; yet, all in all, the degree of success that still attends the attempt of a heterogeneous people numbering more than 75,000,000 souls, and occupying an exceedingly diversified environment, to maintain republican self-government is amazing.

In like manner the students of comparative jurisprudence would not concede that our common law is inferior to the Civil Law of Rome, altho in various specific details we could wisely follow the Roman rather than the English reasoning upon questions of private right and public policy.

It would be difficult to find a more suggestive list of standards and practices in which the ancient world was inferior, and in which it was superior, to the modern world, than that which could be made up from the Code of Hammurabi, first published in English by THE INDEPENDENT in January of last year. In Babylonia three millenniums ago, there was little regard for individual life. The death penalty was imposed for minor offenses with a freedom that would have satisfied Sir Matthew Hale or the late Justice Fitz James Stephen. Individualism as an ideal did not exist. The obvious motive back of nearly every sanction was not the desire to establish ideal justice between man and man, but rather to put an end to strife and preserve the public peace. The citizen lived for the state, and the great thought of Aristotle that the state exists to enable man to live the good life had not yet emerged in political consciousness.

But admitting that public order and material prosperity are the supreme ends in view, the Code of Hammurabi as a study of ways and means is a mine of practical suggestions that our modern legislators would do well to explore, and on one question of policy in particular it touches the high water mark of legislative wisdom.

If one of the great objects of government is to make life and property secure, and thereby to preserve the public peace, it is necessary that governmental officials shall perform their duties energetically, fearlessly and honestly. One of the crying evils of modern times is the gross failure of the authorities to bring malefactors to account, and to achieve a substantial redress of injuries. It is notorious that in the United States few murders are followed by legal executions, and that more burglaries and highway robberies are committed by men that have already served terms in State prisons than by first offenders. Most humiliating of all is the paralysis of legal justice that is exhibited wherever lynchings send men to their doom without formal trial or established proof of guilt.

By what means, if any, can the public authorities be made to exercise greater vigilance in the discharge of this fundamental duty of civilized government? The Babylonian people had answered this question, and we believe that every thoughtful student of public law will agree that their answer was theoretically and practically sound. After imposing the penalty of death upon brigandage, the Code of Hammurabi (section 23) says:

"If the brigand be not captured, the man who has been robbed shall, in the presence of God, make an itemized statement of his loss, and the city and the Governor in whose province and jurisdiction the robbery was committed shall compensate him for whatever was lost."

and then the Code adds (section 24):

"If it be a life (that is lost) the city and Governor shall pay one mana of silver to his heirs."

The principle here asserted is just. It is the logical corollary of the very existence of government, as a device for the maintenance of public security, and no other can be suggested so full of promise of practical results. The first consequence of an establishment of government among men is a denial of any right of the individual to redress his own injuries. When, therefore, the government itself fails to redress them effectively, it has destroyed its own reason for being.

Here and there an American legislature has attempted to make counties responsible for lynchings within their limits. The principle should be carried much further. Not only in the case of lynchings, but, as in Babylonia, in cases of robbery and homicide, a failure of the authorities to bring malefactors to punishment should confer upon the injured parties a claim upon the commonwealth. The effect of such a policy upon nominations and elections and upon administration would be most salutary. Constituencies would think twice if every failure of their officials to achieve the ends for which government is established were to be followed by an immediate increase in taxation.

The whole philosophy of the subject beautifully illustrates the connection between sound theory and sound practice. The great cause of the failures and shortcomings of both our local and general governments lies in a failure to hold them to that work which is the primary justification for the establishment of any government whatsoever.

The Religion of "Parsifal"

If the immortal soul of Wagner is a subscriber to an American clipping bureau there is no doubt that however favorably it may be situated it is in torment. He was accustomed throughout his life to being contemned and condemned, and to having his art misunderstood and misconstrued, but that the supreme expression in art of his philosophy and religion should be treated as an ordinary opera is treated is worse than all he had to bear when on earth.

Of the immense literature which in Europe has grown up around "Parsifal" since the first publication of the poem in 1877 a large part has dealt with the moral and theological ideas presented, while during the past year in America the voluminous discussion has been chiefly concerned with the propriety of presenting on the stage Scriptural scenes such as the washing of Parsifal's feet, or ecclesiastical ceremonial, such as the mass. Almost the only ethical point raised has been that of the right of Herr Conried to produce the drama here against the wish of Frau Cosima, and the "critics" have concerned themselves mostly with noting when the singers had colds and whether the pillars of the Grail temple moved to their places in the proper order.

Art was, however, to Richard Wagner a means of ethical culture and religious development, and it is much more important to consider the moral lessons of "Parsifal" than the technic of its expression. Since the production of "Parsifal" is not to be confined to the Metropolitan, but is to have wider influence, its discussion cannot be confined to superficialities. In spite of its symbolism of ecclesiastical Christianity, the philosophy of life expounded in "Parsifal" is more Buddhistic than Christian. It is most succinctly expressed in the two lines with which, as originally written, Wagner ended the poem (Kufferath's "Parsifal," p. 192):

" Gross ist der Zauber des Begehrens,
Groesser ist die Kraft des Entsagens."
" Great is the charm of desire,
Greater the power of renunciation."

The line of argument by which this is reached can be briefly summarized, tho perhaps not made intelligible to those who are not somewhat acquainted with its historical development through Buddha, Schopenhauer and Wagner. The evolution of the world is due to the instinct of self-assertion, the " Will to Live," which caused the development of the inanimate to animate, conscious and finally self-conscious existence. The last and greatest power acquired, the intellect, begins to study the world, as the world objectively, and finds that this blind, upward struggle for existence has led to universal suffering, and, moved now by the altruistic emotion of pity, resolves upon self-renunciation, the denial of the " Will to Live," so putting an end to the cosmic mistake. Art, philosophy and religion, or, as Wagner would say, philosophy and religion in art, are the means by which men may be brought to perceive and to feel the evils of existence and roused to renounce it.

Young Parsifal, ignorant and incurious, naïvely selfish, and innocently cruel, represents humanity in its earlier stage. He knows not whence he came nor whither he is going. He causes the death of his mother by deserting her to follow off the gay cavalcade of knights; he kills the swan in wantonness; he has no sympathy for the sufferings of Amfortas; he manifests no emotion or curiosity at the ceremony of the Grail. According to the original form of the Parsifal legend, if he had asked a question about the meaning of the strange scene he had witnessed, Amfortas would have been cured of his wound, and Wagner seems to have retained enough of this idea to indicate that in Parsifal the mere rudiment of altruistic feeling which shows itself in curiosity and interest in our fellow men was absent.

But he was teachable. When Gurnemanz explains to him the harm he has done, he breaks his bow and arrows. The touch of Kundry's kiss arouses in him not mere passion, but a vital sympathy for the sufferings of all humanity, of all nature, and he feels in his own breast the burning of Amfortas's wound.

According to evolutionary philosophy altruism has its origin in sexual love, which, at first as materialistic and selfish an instinct as eating, develops into parental love and finally into universal love, the most spiritual of the emotions. This development, which in the human race has taken thousands or millions of years to complete, is necessarily condensed in the drama to a few minutes.

Now that he has come to the point of putting his new sentiments into action, the divergence from what we regard as the true Christian philosophy becomes striking. Sorry that he has killed a swan, Parsifal starts out to kill men. This is the practical working of Buddhism. Buddha fed himself to the starving tigress, and in the land where Buddhism developed there are plenty of hospitals for sick and wounded animals, while thousands of human beings die of famine every year. There are among us some persons who are more Buddhistic than Christian in this respect.

Struck by havoc wrought by the passion of love, greater as it is than the wo which humanity has brought upon itself from the abuse of all its other appetites and instincts put together, he renounces love, and devotes himself to a life of sterile asceticism, selfish isolation, and barren ritualism.

According to Schopenhauer and Wagner, this renunciation and asceticism is the essence of Christianity, and so indeed is has been held by most of those the Church reveres as saints. So to-day it is held by thousands who practice it and by millions who venerate it or aspire to it. To us, however, it seems a perversion and an exaggeration of one only of the elements of true Christianity; illegitimate as a theoretical deduction and injurious in its practical workings.

Pneumonia

So much has been said in the daily papers with regard to the frequency and mortality of pneumonia in the last few weeks that there has come to be a very general impression that the disease has changed its character in recent years and is much more frequent and fatal than it formerly was. It is very true that there are more deaths from pneumonia now than twenty-five years ago. This is not

due, however, to any change in the disease itself, but to other circumstances. One important factor in this matter is that many weaklings who formerly were carried off by various contagious diseases, now more or less under control in city life, are now left alive to become eventually the victims of pneumonia. This is true not only among the old, but also among very young children. Weakling infants often died during the first few days after birth without any definite cause being assigned for their deaths, while now precarious life is preserved in them for a few weeks or a few months, and they die of broncho-pneumonia.

The increase in the mortality from pneumonia is more apparent than real for other reasons than these. Physical diagnosis has become much more exact in recent years, and even a slight affection of the lungs very seldom escapes notice. Terminal pneumonia, as it it called—that is, the inflammation of the lungs developing at the end of an exhaustive disease—is not unusual. It is actually the most important factor in closing the scene. It thus becomes a main element in mortality lists, tho formerly it was scarcely considered and was often not reported. It can always be looked for and is only another sign of approaching death.

Undoubtedly the present tendency to proclaim loudly the prevalence and special fatality of pneumonia has a bad effect on the minds of those who are suffering from the disease. In all diseases of the lungs it is especially important that the patients' minds should be at rest, and that they should, if possible, have the idea that they are very likely to get well. Under present circumstances this is almost impossible, and it makes a serious difference in the prognosis of cases. Physicians find it very difficult, indeed practically impossible in many instances, to reassure patients that pneumonia is after all no such serious thing, and the deaths from the disease, unless in the very young and the old, are due to complications rather than to the disease itself. This is eminently true, however, and pneumonia must still be considered, except under unfavorable circumstances, a benignant disease, with a tendency to self-limitation and complete cure, rather than a malignant malady.

An old English physician said that the prognosis of a case of pneumonia in an adult of middle life depends entirely on what the patient takes into the pneumonia with him. If there is any heart or kidney disease when the pneumonia develops then the outlook is very far from hopeful. The heart has to do extra work in the attempt to pump blood through a consolidated lung, and it is the weaker portion of the heart that is called on to do this extra work. If, then, the heart is not up to the normal it will fail to accomplish the additional task imposed on it. Pneumonia is now considered not to be merely an inflammation of the lungs, but an infectious disease, whose principal symptoms are manifested in the lungs, but are by no means confined to these organs. The toxins of the disease are constantly circulating in the blood and must be eliminated by the kidneys. If these organs are not up to the normal standard they will fail to throw off the burden of toxemia that is weighing so heavily on the patient, and the result will be a fatal termination.

Without such complications, however, pneumonia is not likely to be a fatal disease. The reason for the increase in the death rate at the present time is that the severe winter has proved very trying to many weakened individuals. Continued cold is well known to be hard on persons who have either heart or kidney disease, and so they enter upon the changeful weather of the springtime with very much lowered resistive vitality. Just such an increase of the death rate from pneumonia has been noted after severe winters more than once before. There is no good reason, then, for the scare over pneumonia; and the methods of municipal boards of health in encouraging the publication of sensational statistics in many cities of this country are very inadvisable, indeed, entirely uncalled for, and will do harm rather than good.

Extending the Pensions

ANY amount of legislation is done and has to be done indirectly. Legislatures make laws in general terms, and Executive or Judicial authority defines their application and often extends them to cases which the legislative body never had in mind. It is so with the law against trusts, meant to apply to industrial corporations, but which the

Supreme Court extended, very properly, we suppose, to railroads. "Judge-made law" is abused, but it cannot be prevented. It meets a necessity. Just so executive orders, emanating from the President, Governors, or heads of departments, have to be issued interpreting legislation. We have such cases very frequently in connection with the collection of customs at our ports.

Another executive order has just been issued by the Interior Department affecting the payment of pensions. It is directed that the fact that a soldier has reached the age of sixty-two shall be regarded, as in the army, as evidence of partial disability, and shall entitle him to claim a monthly pension of six dollars, which shall be increased to twelve dollars when he reaches the age of seventy. Of course, nearly all the war veterans have reached this age, and would thus be entitled to the pension.

This ruling has excited no little disapproval. It is claimed that it is an illegitimate act of arbitrary authority; that it is meant to supplant a proposed service pension; that it is really an act of legislation and not properly executive, and that it is a robbery of the Treasury.

Beyond question, the ruling is a surprise, and beyond question it does render a service pension practically unnecessary. Yet we have had just such a ruling for years with no objection. It differed from the present ruling in that it put the ages for partial and total incapacity at sixty-five and seventy-five years, instead of at sixty-two and seventy years of age. Yet the question must be answered whether either ruling is a fair interpretation of the pension law, or is a shrewd evasion of it. The law provides:

"That all persons who served ninety days or more in the military or naval service of the United States during the late War of the Rebellion and who have been honorably discharged therefrom, and who are now or may hereafter be suffering from a mental or physical disability of a permanent character, not the result of their own vicious habits, which incapacitates them from the performance of manual labor in such a degree as to render them unable to earn a support, shall, upon making due proof of the fact according to such rules and regulations as the Secretary of the Interior may provide, be placed upon the list of invalid pensioners of the United States, and be entitled to receive a pension not exceeding twelve dollars per month, and not less than six dollars per month, proportioned to the degree of inability to earn a support."

The conditions under this law are that the veteran soldier shall have served ninety days, shall have been honorably discharged, and shall be more or less incapacitated by mental or physical disability, through no fault of his own, to earn a living by "*manual labor.*" The law says "manual," not intellectual, labor. It is nothing that Secretary Hitchcock is sixty-nine and can administer the Treasury Department; could he earn a living by "manual labor"? William P. Frye is seventy-three years and able to preside over the Senate, but could he support himself as a laborer?

It appears to us that it is *prima facie* proof that a man cannot gain a full support by manual labor that is sixty-two years old, and it would require strong evidence to show that a man of seventy years could do so. There are such cases, but they are rare; and a man of seventy ought not to be expected to do hard manual work. Many good students of sociology believe that Germany, France, Austria, Switzerland, Australia and other countries are right in their system of old age pensions. Germany, for example, has for years required no other proof of disability than that a man has reached the age of seventy.

Accordingly we fail to be outraged by this executive order. We might have liked it better if Congress had itself made its legislation clear, but we do not see that this interpretation is wholly indefensible. We imagine that the Supreme Court would sustain its principle, if not its full application. And we remember that a service pension was passed by Congress applicable to veterans of the Revolutionary War and the Mexican War at the end of thirty-nine years.

Social Gravitation

THE census proves incontestably that the drift of population cityward reached its maximum some years ago, and has begun to recede. Some one has said: "Hereafter the city and the country will march side by side, with

even step." Even this is hardly probable. The change of drift is owing to economic conditions that will continue strongly to favor the country. Population will still move out and differentiate from the masses. In fact, the coming ideal seems to be rather an evenly distributed suburbanism, covering the whole country; while the cities will remain as ganglia. Following this ideal the city will grow more country-like, while the country will steadily acquire those privileges which have heretofore belonged to the city.

According to a recent census bulletin, 159 towns show an increase of 32 per cent. during the last ten years, which is about the average of the increase of the whole country. The relative gain of cities from 1880 to 1890 was from 22 to 29 per cent.—or 7 per cent. positive increase—but from 1890 to 1900 this increase was only about 2½ per cent. This tells the story with accuracy. It does not warrant us in assuming that cities will cease to grow, but that relatively they will cease to grow as fast as the country.

The evolution of the city as a special feature of American life began about seventy-five years ago. It was due to the rise of manufacturing that was caused by the introduction of steam, and the protection of manufactures by the country. After the Civil War conditions were once more like those after the war of 1812-14, when New England, from being almost solely agricultural, had become quite as completely manufacturing. Large manufactures had grown up during the war, and had received a mighty stimulus. People poured into the cities until there was great difficulty in running our farms at all. The best "help" was drained off, and the most socially inclined youth learned to despise the country. For a while farm produce was in such home demand as to prevent collapse. Then the opening of Western States, and a vastly increased output, owing to the use of agricultural machinery, became a factor. Eastern corn and wheat were driven out of the market, because, relatively to Western production, it cost too much to grow them. It was easier to sell out and move into the cities than it was to constantly readjust farm work to new conditions.

Another potent cause for depopulating the country came in with improved machinery. Farm work could be done with fewer hands. A single reaper would displace ten men. Costly machinery could be profitably used only on large farms, yet a single reaper might serve a dozen small farm owners co-operatively. So far, the Eastern States were at the greater disadvantage, and deserted farms were common throughout New England. It was wiser to go West with small capital, and leave the homestead to go back to wilderness, rather than to remain and be starved. This state of affairs, in aggravated symptoms, continued until near the close of the nineteenth century.

A change crept upon us imperceptibly. It was first of all noted that better methods of farming had raised the average wheat crop in New England to a higher percentage per acre than was raised in Illinois and Michigan. Connecticut turned to successful peach growing; and intensive farming brought horticulture and gardening to the front through all the Eastern States. Agricultural colleges and experiment stations had much to do with the improvement of farm affairs. It was also notable that electricity was distributing labor instead of concentering it, as steam had done, in huge factories. The deserted farms, which were annually advertised by some of the New England States, were so completely absorbed by the new drift that nothing has been heard of them for the past two or three years.

Agriculture was once more wedded to mechanics and manufacturing. Before 1850 a farmer meant one who could do a great deal besides till land—could make shoes and build houses, while his wife could weave cloth and make clothes. The new drift gives back a diversity of industries to the countryman. It is the same tendency that in the cities has worked back again from specialized stores to general bazaars. The problem for seventy-five years was how most cheaply to get food to the eaters; it is now how to get the eaters to the food.

Another cause for the reaction which we chronicle is the splendid increase in the value of farm products, brought about by our having secured the world's markets. Commercial expansion during the last ten years has immensely increased the exportation of nearly everything that the farm produces. Our fruits, our meats, our corn are now found in every market of the globe. There is no longer any fear of overproduction; we have only to insist upon the open door principle and free competition. The farmer can apply his whole attention to the increase of products, and the conquest of insect and fungoid enemies. Agriculture is proving itself to be once more what it was in the early part of the last century, the most independent of all the industries. With these conditions we do not see that there is any prospect of a check being given to what we may call the greater suburbanism. The cities will undoubtedly continue to grow, but the ratio of growth will grow larger and larger in favor of the country. The percentage of increase of population, which went cityward in 1890, had decreased one-half by 1900—that is, from 64 per cent. to about 32 per cent. With the vast increase of relative country privileges this ratio is continuing to decline in favor of the farmer.

Race Pride

A YOUNG girl had gone to a French priest for her first confession. She had confessed every little peccadillo she could think of, when the priest asked her if there was nothing else she ought to tell him. She began, "I have a sweetheart."

"You have a sweet heart?" he cried. "Zat is a vaira great grace. I am a priest of God, and I have not zat grace. You must be vaira careful of zat grace!"

She said she would.

A grace that comes from God—that is, the gift of nature—is something to be careful of, not something to be vain or proud of. A man is born heir to a dukedom or a throne. What of it? That is not to his credit. The family may give him position, opportunities or responsibilities, but no reason for glorification. A man is born an Englishman. That is nothing to be proud of. It is no credit to him. He might have been born a Russian or a Prussian or an Italian, which would equally have been no discredit to him. So if a man is born an American, or an Anglo-Saxon, or a Caucasian, it is nothing for him to be proud of. He may be humbly glad that he was born where he has had the privileges of civilization and education, and he has corresponding obligations to make the most of his advantages, but there is no place for personal or racial conceit.

There is no race that is so given to arrogance over its imagined superiority of blood as is the Anglo-Saxon; and it is its chief weakness. Even so admirable a poem as Kipling's "Recessional"—and Kipling seldom sins in this direction—has its fling at the "lesser breeds." This pretention runs to insolence, and is a political damage to the English in India and to Americans in the Philippines and at home.

One of the worst pieces of advice that can be given to any people is that they cultivate their family, national or race pride. Yet, that is the instruction preached for a hundred years to Frenchmen; and the result is that in France justice has a hard fight against "glory." We have no love for the sentiment properly called pride in the greatness and success of our American nation. We do not care to "point with pride" at what we have done. Other sentiments are far more suitable. Such pride, too, easily becomes, on Independence Day, disgusting vainglory. We may be thankful for our history; we may be seriously resolved to make the most of our opportunities, but boasting is excluded.

We often hear it said to the separated races in this country, "Cultivate your race pride." We say no such thing. We would have no more pride of race than pride of family. Let the man—the individual man or woman—keep his character clean; let him do his best service for those associated with him; let him be ashamed when he fails and thankful when he succeeds, and he will thus honor his family, his race, his nation and add to its stock of honor in the world.

For the last analysis or synthesis of ethics will take account of men indi-

vidually, and not of families, nations or races. It was one thing that William Lloyd Garrison said well: "Our country is the world; our countrymen are all mankind."

Japanese Character

Possibly Mr. Colgate Baker, in his article on "Japanese Character," which we publish this week, is as far astray on one side as are the books of Lafcadio Hearn, the Levantine, who turned Japanese, on the other. We decline to believe that there is any such essential and innate difference between the moral natures of races as cannot be changed by education. "*Never*" is a word that looks far ahead, and we also refuse to believe that the Japanese have to no appreciable extent been affected by Christianity and "never" will be. Already the Roman Catholics claim 56,000 adherents in Japan, and the Greek Catholics half as many, while the Protestants have 55,000. The Protestants have 500 organized churches, 50,000 children in their Sunday schools, and 12,000 in other schools. But their greatest influence has been in literature and in the molding of public opinion. Christians stand high in the army and navy and in Parliament. Admiral Uriu is a Christian, and so is the President of the Lower House of Parliament. There are more children at school in Japan than in all Christian Russia, and more Japanese than Russians read the morning papers. A hundred Japanese are in German universities. As to the charge that the Japanese heartlessly forget their dead, we turn for comparison to the old family Bible, and we there read in the thirty-eighth chapter of Ecclesiasticus:

"My Son, let tears fall down over the dead,
And begin to lament, as if thou had suffered great harm thyself;
And then cover his body, according to the custom,
And neglect not his burial.
Weep bitterly, and make great moan, and use lamentation,
As he is worthy, and that a day or two,
Lest thou be evil spoken of;
And then comfort thyself for thy heaviness—
For of heaviness cometh death.
And the heaviness of the heart breaketh strength.
Take no heaviness to heart;
Drive it away, and remember the last end,
Thou shalt not do him good, but hurt thyself.
Yesterday for him, to-day for thee.
When the dead is at rest, let his remembrance rest;
And be comforted for him, when his spirit is departed."

A Japanese Who Knows His Bible

Baron Keneko, now visiting the United States, an ex-Minister in Japanese Cabinets, if he is not a Christian, understands and can apply the Bible pretty well. He told the reporters the other day that it was not a question whether Russia is a Christian and Japan a pagan country, but which has the just cause in this conflict. It does not seem, said he, like good Christianity to say that the pagan fighting in a just cause must be put down. Then he repeated the parable of the good Samaritan, and asked, "Is not Asia the poor wounded traveler that has fallen among thieves, and is not Japan the good Samaritan? And did not Jesus praise the good Samaritan, who was a Gentile, above those of his own race? Besides," said he, "is not Japan the country where religious freedom is allowed by the Constitution, and Christians occupy the highest places in the Government?" Baron Keneko is himself a graduate of the Harvard Law School, as are also Baron Komura, the present Japanese Minister of Foreign Affairs, and Baron Kurino, the late Japanese Minister to Russia. Baron Keneko said:

"Every department of the Japanese Government has been developed and organized under the advice of Americans, and we realize that it has been the unselfish object of the United States to bring us to Western civilization in the most peaceful and friendly way without encroachment and without hurt."

That is a fair statement; but it only in part accounts for American sympathy with Japan.

A Quaker Biography

This from the Philadelphia *Press* is worth reprinting. It is the answer given by the president of a Philadelphia company to the agent of one of the biographical directory concerns, who asked for the usual story of birth ancestors, education, religion and career:

"My great-grandfather was shot in his doorway in the American Revolution because he would neither fight nor resist the British. My grandfather lost a fortune because he would not appear in a law court. My father's house was five times burglarized because he would

lock neither doors, windows nor drawers. When my father died neither my mother nor any member of my family wore mourning.

"I was never baptized. I married without the aid of a clergyman. I have never taken the oath of allegiance to the United States, nor any other oath; but I sometimes silently swear. I have never served on a jury, and never will. Were this country to become engaged in a great war, and I the last man not in uniform, I still would refuse to take up arms.

"In my house a piano is forbidden, also any other musical instrument, save the human voice, and even singing is prohibited on Sundays. I am of no political party, never vote, have no interest even in a Presidential election. When presented to the President at the White House, I addressed him as Theodore, and his wife as Edith. Mr. and Mrs. are not in my vocabulary, nor any other title, save Friend.

"In my religion there is neither form, creed, ritual, liturgy nor priesthood, nor money-earning nor money-spending. To worship costs me two dollars a year—my surplus is given without the tinkling of cymbals to the worthy in need. In church I have never sat beside my wife, daughter, nor any other woman.

"I never attend big dinners, nor toast my fellowmen. I settle material disputes with my brothers by arbitration. I give equal rights in all things to women. I recognize no man as a lion. I have never lifted my hat to anyone—to woman, potentate nor God. In church I keep my hat on my head, and to the Golden Rule I add the admonition 'Silence!' I am the man to whom General Booth of the Salvation Army, appreciating the humor of the situation, shouted above the din of tambourine and the shriek of cornet: 'Your people and mine have much in common. You add a little quiet; we add a little noise.'

"Please omit my name from your book. A Quaker has no use for the brass bands of publicity."

Philippine Self-Government

The census of the Philippine Islands has been completed in perfect peace, altho not without local difficulties. When a census is taken for the first time people will imagine that it is meant to impose new taxes. The result of the census is not yet known, and yet remains to be compiled. But the interesting point for us to understand is that this is the preparatory step to giving the Philippines the same degree of self-government that we have given to Porto Rico. In two years, under the law, if the Philippines are at peace—the Moro country being excluded—the present local self-government will be extended to the general government. Thus a House of Representatives will be elected by the people, which will have equal part in the government of the Islands with the Senate, which will be, for the present, appointive; and Secretary Taft intends to return to the Islands on a visit, to see that the system is properly inaugurated. And yet they get up ridiculous committees in Boston to urge Philippine independence! And there are people yet who actually believe that the purpose of the American people toward the Philippine is not altruistic and beneficent. Such has been the central purpose of our people from the beginning of the war for Cuban independence.

The French-English Treaty

No diplomatic achievement in these late years, always excepting the Court of The Hague, makes more for international peace and good will than the announced conclusion of a treaty between Great Britain and France, in which all the outstanding questions between the two countries of any gravity have been peacefully settled. What Europe would dread most is a war between France and Great Britain, which might very likely involve other great Powers and bring on a European war of terrible dimensions and consequences. That France seems to get the best of the present political bargain is not so bad a thing, because it brings France into closer sympathy with her natural ally across the Straits of Dover, and to that extent weakens her attachment to Russia, which appears to be Great Britain's natural enemy. All this tends to throw Russia and Germany together, against the rest of Europe. France becomes, under this treaty, paramount in Morocco, to the considerable loss of British prestige there; but France has a nearer right in Morocco than has Great Britain, if not a nearer right than Spain, which is now a negligible quantity in international affairs. France will recognize England's rights in Egypt, but will obtain from England a bit of African territory by which she will gain access to Lake Tchad. For Americans, the matter of most interest is that France accepts pecuniary compensation for yielding her troublesome rights in Newfoundland. Of course

all this will not please Russia, but France has got nothing out of Russia these years since 1870, except the privilege of lending money to a Government threatened with bankruptcy by the war with Japan.

Irish Sympathy with Russia

It is difficult to believe that the Irish in this country have a bit more sympathy with Russia than have the rest of our people, but they declare they have. In the St. Patrick's Day parade last week there were a multitude of Russian flags carried; and at a meeting of Irish citizens in this city to celebrate the birthday of Robert Emmet resolutions were passed declaring that American sympathy ought to go with Russia in the present war, and that Secretary Hay is to be condemned for seeking an "open door" in China, and for trying to "localize the war" and preserve China's "administrative entity," because it veils hostility to Russia. But all this was pure Democratic politics, and the pretended affection for Russia is only undisguised hostility to England. Irishmen love liberty and hate oppression as much as other people, and it is impossible that they should have any deep-seated love for Russia. To them England is the nearest oppressor, and they shake hands with any enemy of hers. Let England give Ireland a local Parliament, as she ought to, and all this hostility would give place to pride in their common country.

It is now a good many years since THE INDEPENDENT registered a vow that it would utter no word in rebuke of Mormon polygamy without accompanying it with a severer condemnation of the nearer and worse complex marriage system of the Oneida Community close at our doors. That enormity was overthrown by the determination of the young members as they grew up, and the Community leader left it and spent the remnant of his days at Niagara Falls. It is a hopeful statement, which comes from Salt Lake City, that five hundred young Mormons have banded together and threaten to quit the Church unless President Smith and other leaders cease living in polygamy. It is from that source, from the young men and women inside, that the hope must be expected of the utter overthrow of polygamy. We believed that polygamy was doomed when the rule was made against it in the Church, because such reforms do not go backward.

That is an interesting question which the Chicago Federation of Labor discussed last Sunday. The Chicago Presbyterian Ministers' Association—so the Monday papers tell us—sought membership in the Federation of Labor, but the latter was not at all sure whether they should be admitted. Are they producers, was the question, or are they "parasites"? Our correspondent, the Rev. Charles Stelzle, was present to hear the discussion, and he found it lively. Ministers, lawyers, physicians, teachers, Congressmen—are they "parasites"? And will the Presbyterian Ministers' Association, if admitted, be expected to indulge in sympathetic strikes?

As to the main facts given in Mr. Wharton Barker's important communication this week there can be no doubt. There is sufficient testimony to prove that the simultaneous appearance of the Russian fleet during our Civil War on the Atlantic and Pacific coasts, under sealed orders, was meant as a demonstration against the recognition of the Confederacy by European nations. Whether the purpose was love to America or hostility to Great Britain may be gathered from Mr. Barker's article.

President Eliot, of Harvard University, is now seventy years old, and by no means an old man. We do not hear that he proposes to resign at that age, as has been the good custom at Yale, or that anybody wants him to do so. He has been a most efficient leader in educational reforms, even if he has in some directions gone farther and faster than sound wisdom would dictate, and he has had to be restrained by his associates in the government of the university.

At a Vermont school a student was caught by upper classmen, stripped and tarred and feathered. His parents have done the proper thing; they have had suit brought against the culprits for assault and battery, and it is to be hoped that they will be severely punished. The law is the means to stop the crime of hazing.

Insurance

Women and Life Insurance

TIME was when the woman who wished to insure her life encountered many difficulties. Some companies did take women as risks, but were ungallant enough to insert severe conditions and difficult specifications in the policies issued to them. The physical examinations to which women were subjected were rigorous, and if the "soundness" of the woman was satisfactory she was obliged to pay an extra premium to cover any possible fatality to which she might be subject because of her sex.

Now, however, all this has been changed. In insurance circles women are (metaphorically) received with open arms. Prejudices against the feminine hazard have passed with time, and they are insured as eagerly as if they had not the old sex handicap. Some of the life insurance companies have, it is true, only come into line during the past year, but that is neither here nor there.

The part taken by women in the business world and their close business contact with men has impressed the masculine point of view upon women so situated. Consequently the business woman of today has come to look upon life insurance with her own or some other brother as a good investment for her money. This is particularly the case with self-supporting women. It has taken a very long time for some of the companies to find out that women as a class live longer than men, but that they do, now seems pretty well established, and in consequence since 1890 women have been regarded as gilt edged risks.

This, as Gage E. Tarbell has pointed out, has opened up a tremendous field, composed of teachers, nurses, secretaries, women in clerical positions of various kinds, and other female bread winners. In some cases a woman now reverses the conventions and insures herself in favor of her husband, altho insurance companies do not always look upon this with favoring eyes. Many mothers have adopted the idea of taking out 15-year policies as a means of educating their children. When the policy is taken out simultaneously with the birth of the child it matures just when it will do the most good. Capital with which a son or daughter can go into business is also thus provided.

Life insurance also offers a profitable field of work for women, and some women are enabled in this way to command royal incomes in the place of pittances that they formerly enjoyed (?).

Uniform Hose Couplings

THE recent extensive fires in Baltimore and Rochester, from both of which cities calls were made upon neighboring cities for aid in fire fighting, has directed attention to the desirability of uniformity in the size and screw threads of hose couplings throughout the country. Manufacturers of microscopes long ago found what is called the society screw a good thing, the universal adoption of which makes objectives of all makes interchangeable, and if a standard is good in one case it ought to be good in the other. When such extensive fires occur as those which recently visited both the cities named it is a very serious obstacle to effective work on the part of visiting fire companies to find at the outset that it is impossible to couple their hose lines to the hydrants. Failing an open supply of water available by means of suction pipes, the fire engines might as well be scrap iron. The *Spectator* in uttering a warning note on this subject merits the co-operation of the insurance journals as well as of the companies who are financially interested in the hazards.

The Probable Origin of the Baltimore Fire

A REPORT just issued by the special committee appointed by the General Loss Committee of the insurance companies interested in the recent big fire at Baltimore states that the fire must have originated through the agency of a lighted match, a cigar or cigarette stub dropped through a broken deadlight in the sidewalk. The combustion of inflammable material thus started may have smoldered for a long time, creating heat and smoke which, when the doors were burst open by the firemen, caused flames and the explosions that have been described.

Financial

The Fall of Sully

In Sully's brief career, his successes and his failure, there is nothing new. Such has been the history of the Keenes and the Leiters in wheat, the Prices, the Steenstrands and the Inmans in cotton. There comes a time when the best equipped of these daring speculators loses his head and actually begins to believe the stories and arguments which he has been urging others to accept. Daniel J. Sully had an exceptional knowledge of the cotton trade. He had been a buyer of cotton for great mills. In the South he had carefully and intelligently studied the industry of producing cotton. In a broker's office and in the Exchange he had become familiar with the methods of trading and speculation. All this was preparation for that spectacular campaign of eighteen months that gave him great riches and then dropped him again at the foot of the ladder.

During the crop year of 1902 the price of cotton ranged between 7⅞ and 9 cents. Sully and those who followed his lead raised it from 8⅞ at the beginning of 1903 to 13½ in July. There was for him in that a profit of about $2,000,000. Proof that he had not yet lost his head is shown in his purchase at that time of an annuity of $10,000. Later in the year the price was down again. Another advance from the low point touched in October increased his profits. It was in February last that the price was pushed up to 17⅝ cents. At the beginning of that month Sully told a friend that he had won $6,000,000 and was trading to make only $1,000,000 more. Reaching for the one more he lost the six. At first he had sought, as he said, to educate the people up to 14-cent cotton; at the end he had himself come to believe in 20-cent cotton. He lost sight of the closed mills here and abroad, of the reduced wages of employees remaining at work, of the restricted consumption of cotton goods. He continued to buy, and at the same time other speculators who had been buying with him decided to sell. In fact, they unloaded upon him. He could not forever keep on buying, and so prices fell and he went down with them.

It would be better for the cotton industry, in the mills and on the plantations, if there were no Sullys. The effect of the abnormal prices maintained temporarily by these speculators has been to disturb greatly the mill industry in England and here at home, cutting down wages and even closing factories. It has stimulated harmful speculation in the cities and small towns of the South, and promoted the attempts of our European customers to grow cotton on their own colonial lands in the East. Our planters have received extraordinary prices for their cotton, but in the long run a fair price, undisturbed by sharp fluctuations, and determined by the rule of natural demand and supply, is best for them and for all of our people.

The annual report of the Hamburg-American Steamship Company, recently published, shows a net profit of $5,500,000 for the year. No subsidies, the report says, are received from the Government.

....Railroad net earnings for Januarv (103 roads reporting) show a loss of $8,000,000, or 25 per cent., as compared with those of January a year ago, the decline being from $32,000,000 to $24,000,000.

....The Bank of New York, the oldest bank in New York and the second bank established in this country, observed its one hundred and twentieth anniversary last week. The constitution of the bank was written by Alexander Hamilton, who was its counsel and a stockholder and director. The bank has occupied its present location at William and Wall streets since 1798, except for a temporary removal during a yellow fever epidemic.

....Dividends and coupons announced:

Atchison, Topeka & Santa Fe R'way, Gen. Mort. 4's, payable April 1st.

San Francisco & San Joaquin Vall. R'way, 1st Mort. 5's, payable April 1st.

Franklin Trust Co., Brooklyn, quarterly, 3 per cent., payable March 31st.

United Fruit Co., Boston, quarterly, 1½ per cent., payable April 15th.

Am. Teleph. & Tel. Co., Boston, $1.50 per share, payable April 15th.

Am. Woolen Co., Preferred, 1¾ per cent., payable 15th.

Empire State Surety Co., 2½ per cent., payable April 1st.

The Independent

Vol. LVI NEW YORK, THURSDAY, MARCH 31, 1904 No. 2887

Survey of the World

Instructions for the Canal Commission

At the first formal meeting of the Panama Canal Commission, last week, an important letter of instructions from the President was read. The Commissioners knew, he said, that they had been chosen with reference to nothing save his belief that they were, among all the available men of whom he had knowledge, the best fitted to bring this great task to a successful conclusion:

"You have been chosen purely because of your personal and professional reputation for integrity and ability. You represent the whole country. You represent neither section nor party. I have not sought to find out the politics of a single one of you, and indeed as to the majority of you I have not the slightest idea what your political affiliations are. I believe that each one of you will serve not merely with entire fidelity, but with the utmost efficiency. If at any time I feel that any one of you is not rendering the best service which it is possible to procure I shall feel called upon to disregard alike my feelings for the man and the man's own feelings, and forthwith to substitute for him on the Commission some other man whom I deem capable of rendering better service. Moreover, I shall expect, if at any time any one of you feels that the work is too exhausting and engrossing for him to do in the best possible manner, that he will, of his own accord, so inform me, in order that I may replace him by some man who to the requisite ability joins the will and the strength to give all the effort needed."

He should expect them, he continued, to be guided by these same principles in the choice and retention of subordinates:

"I shall expect you to appoint no man for reasons other than your belief in the aid he can render you in digging the canal. If, having appointed any man, you find that your expectations about him are not fulfilled, or that from any reason he falls short of his duty, I shall expect you to dismiss him out of hand. I shall expect that under such circumstances you will pay not the slightest heed to any backing or influence the man may have. I assume, as a matter of course, that in dealing with contractors you will act on precisely the principles which would apply to any great private business undertaking."

It was unnecessary, he added, to say anything as to the standard of honesty to be exacted from every employee or contractor; but he wished to emphasize the need of unceasing vigilance in the performance of this great work, which "is to be done as expeditiously as possible, and as economically as is consistent with thoroughness." He asked their special attention to the question of sanitation and hygiene:

"You will take measures to secure the best medical experts for this purpose whom you can obtain, and you will, of course, make the contractors submit as implicitly as your own employees to all the rules and regulations of the medical department under you. I presume you will find it best to have one head for this medical department, but that I shall leave to your own judgment.

"The plans are to be carefully made with a view to the needs not only of the moment, but of the future. The expenditures are to be supervised as rigorously as if they were being made for a private corporation, dependent for its profits upon the returns. You are to secure the best talent this country can afford to meet the conditions created by every need which may arise. The methods for achieving the results must be yours. What this nation will insist upon is that the results be achieved."

W. A. Day and C. W. Russell will represent the Department of Justice in Paris with respect to the transfer of the Canal Company's property.—Gen-

eral Reyes said, last week, before leaving France for Colombia, that he desired to avoid action that would delay the construction of the canal. His remarks indicated a belief that he had been elected President of Colombia. Recent reports from Bogota say that he was defeated by Joaquin Velez.

National Politics

On the Republican side, State and District conventions, by instructions, or otherwise, are calling for the nomination of Mr. Roosevelt. In Georgia, Texas and Mississippi there is a race division of delegations at large—two whites and two negroes for each of the States. Ex-Governor Crane, of Massachusetts, has finally decided that he will not take the chairmanship of the National Committee.—In the Democratic Party, Mr. Hearst's growing strength as a candidate for the nomination annoys the conservative element. At last accounts, of 128 delegates elected in Illinois he had 120. The delegates from South Dakota are his, and he will probably have those of Kansas and Minnesota. It is expected that a large majority of those chosen on the Pacific Coast will vote for him. In Boston, last week, he began the publication of a newspaper, and the presses were started by the Republican Governor of the State, who commended Mr. Hearst's enterprise, saying that "an aggressive and fearless press is the greatest power for good in the world." The ceremonies were followed in the evening by a meeting in Faneuil Hall, under the direction of the Labor League, at which was read a long letter from Mr. Hearst, against Trusts. His supporters in Massachusetts are contending with the friends of Mr. Olney for control of the State's delegation.—Judge Parker will have a majority of the delegates from New York. Some assert that the real purpose of the Tammany leader, Mr. Murphy, in opposing instructions in favor of any candidate, is to serve in some way the ambition of Mr. Hearst. The Judge's friends explain that his silence concerning all political questions is due to his determination to preserve the dignity of the bench. Ex-Judge Roger A. Pryor publishes a statement in which he says that he has known Judge Parker for years and can say that the latter is hostile to Trusts.—There is talk among the Democrats of New Jersey about nominating Mr. Cleveland for Governor of the State.—General Miles, in a letter to a prominent temperance leader, advises that the Prohibition Party take no action until after the Republican and Democratic conventions, in order that it may be guided by the inadequacy of their platforms or candidates.—Secretary Moody intends to retire from the Cabinet at the end of Mr. Roosevelt's present term, to resume the practice of law.—Governor Warfield, of Maryland, has suggested to the Democrats of the State Legislature important changes in the bill for a Constitutional Amendment (recently passed, and designed to disfranchise negroes), and has withheld his approval, pending a consideration of his propositions. He asks that all citizens naturalized before the adoption of the Amendment shall be permitted to vote, and that the franchise be given to any citizen who has $400 worth of property. The Democratic majority, resenting this interference, has ordered that the Bill or Amendment be held by the clerk of the Court of Appeals until it shall be necessary for the Governor to place it on the official ballot for the election in 1905. This attempt to ignore the Governor's veto power was suggested by Mr. Gorman.

Conviction of Senator Burton

The case against Senator Joseph R. Burton, of Kansas, charged with having unlawfully accepted pay for using his influence at the Post Office Department in behalf of the Rialto Grain and Securities Company, apparently to prevent the issue of an order withholding from that company the use of the mails, was given to the jury, in St. Louis, last Saturday night. A verdict of guilty was announced on Monday. It was admitted at the trial that the Senator had been employed by the Rialto Company as general counsel at $500 a month, and had received $2,500; that he had inquired at the Post Office Department concerning the complaints of persons who said they had been defrauded by the company, and that he had sent to the company in November, 1902, a letter containing the following words:

"No action will be taken against you [at Washington] without me being advised, and I shall be informed of any hearings before the Post Office Department. In return, if agreeable, you will please make remittances for my first month's salary."

The Vice-President and one of the clerks of the company testified that at Burton's request, in December last, they had destroyed letters received from him. Chief Inspector Cochran (of the Department) testified that Burton had told him that he appeared at the Department as an attorney for the company, and not as a Senator. Burton had said to him that many Senators increased their incomes in such ways, and that several Senators whom he had consulted had assured him that his action was not unlawful. Burton, testifying in his own behalf, said that he became counsel for the company because he needed the money. He had never sought to influence the action of the Department. His inquiries concerning complaints were made in order that he might know for his own protection whether the company was violating the law. "I told Mr. Cochran," said he, "that other Senators and Representatives had built up large private practices during their terms of office, and that I, in a small way, desired to emulate them." He said he had urged Cochran to warn him if at any time he did wrong. The maximum penalty for the Senator's offense is imprisonment for two years, a fine of $10,000, and disqualification for holding a Federal office.—Charles Cunningham, a millionaire owner of sheep and cattle ranches, has been indicted at Portland, Ore., with six of his employees, for conspiring to defraud the Government of large tracts of land. Secretary Hitchcock says that this is only a beginning and that many other indictments will follow.

The Work of Congress

China has denounced the Chinese Exclusion treaty, which will therefore expire by limitation on December 27th. If this action had not been taken, the agreement would have been in force for another term of ten years. China was told that conditions more favorable to her could not be obtained, and that a new treaty might not be ratified at Washington. If it should be rejected, she would be exposed to the full rigors of the Geary law. But she insisted upon denunciation, and now the State Department is preparing a new treaty. Mr. Hearst in his newspapers urges workingmen to be on guard with respect to a new agreement, and to use their influence to prevent the admission of Chinese into the Panama Canal zone or the Philippine Islands.—There will be no decision at this session in the case of Senator Smoot. It is said that a sub-committee will be authorized to visit Utah and to make there an investigation covering the whole Mormon question. The effect of the testimony already taken has convinced the committee that the inquiry must go beyond Mr. Smoot's right to a seat in the Senate.—Mr. Miers, the ranking member of the minority in the House Pensions Committee, in the course of a speech against the recent executive order, which virtually grants service pensions, estimated the annual cost of the order at $14,174,000, of which only $3,470,000 will go to pensioners now on the roll, in the form of increases for age. Senator Carmack has introduced a resolution asking the Judiciary Committee for an opinion as to the legality of the new order. Mr. Hoar, chairman of the committee, said he hoped the resolution would not be referred to that committee, as there would not, probably, be time at this session for an investigation and a report. With respect to the increases authorized to be made with the pensioner's advancing age, the order appears to be in conflict with an existing law, which provides that "except in cases of permanent specific disabilities" the increase must be preceded by and must depend upon the examining surgeon's certificate establishing these disabilities and made under the claim for increase.—In the case of District Judge Charles Swayne, of Florida, the House Committee's report, calling for impeachment, is very severe. It asserts that he has been harsh, tyrannical and oppressive; that he has continuously and persistently violated the laws; that he has fined and imprisoned members of the bar through ignorance or malice and without authority of law; that he has been guilty of a gross abuse of judicial power in purchasing land that was in litigation before him and in imprisoning attorneys who brought suit to clear the title of the same,

and in lending himself to a conspiracy to ruin an honest man, one Hoskins, whose son was driven to suicide by Swayne's attempt unjustly to imprison him for contempt. Congress desires to adjourn by May 1st. An impeachment trial might consume a month. It may be that the taking of testimony can be delegated to a committee. At all events, the Senate does not intend that adjournment shall be delayed by this case, which will probably go over to the next session.—Senator Quay's resolution calling upon the Treasury for a statement of the difference between the gold value and the paper currency value of payments made to the Delaware Indians in the years from 1862 to 1878 has excited some alarm and was characterized in the Senate by Mr. Hale as an opening wedge for a demand for the difference. The statement, it is said, will serve as the basis of a claim. The claims that might be made upon such a foundation, Mr. Hale remarked, would call for hundreds of millions of dollars. —Inquiry concerning the postal report relating to the requests of Congressmen shows that First Assistant Wynne objected to the use of their names, because they had only been doing their duty. Mr. Payne agreed with him; but Chairman Overstreet called for the entire list, and it was prepared for him under the direction of Chief Inspector Cochran.—Ex-Postmaster General Charles Emory Smith in his newspaper attacks Charles J. Bonaparte, the Government's special counsel, calling him an "irresponsible crank."

Labor Disputes

Martial law was proclaimed last week in two counties of Colorado—Las Animas, which includes Trinidad, where the coal miners have been on strike for several months; and San Miguel, in which Telluride is situated. When it was learned that the sixty union miners forcibly expelled from Telluride by the Citizens' Alliance intended to fight their way back, and had obtained from Judge Stevens (of one of the State courts) an injunction restraining the Alliance from opposing them, the Governor sent troops to Telluride, where the local press was subjected to censorship. It was reported that 1,500 of the strikers at Trinidad had procured arms. Upon the arrival there of troops, on the 22d, the sale of fire arms was forbidden, all persons having such weapons were required to register them with the military authorities, and the publication of an Italian weekly (said to be an advocate of anarchy) was suppressed. The Governor and the Attorney-General decided that labor agitators who had come to Trinidad from other States should be deported. On the 26th, "Mother" Jones, William Wardjon (of Iowa), Joseph Pagini and Adolph Bartolli, editors of the suppressed weekly, were arrested, placed on an east bound train and ordered never to return to Las Animas County. President Moyer, of the Western Federation of Miners, has been arrested, and is in jail at Telluride, charged with having desecrated the national flag by printing incendiary addresses on pictures of it.—At the beginning of this week, there was no prospect of an approaching settlement of the controversy that threatens to paralyze again the building industry in New York. The bricklayers say they will not resume work until the employers recognize the laborers' or hod carriers' union; the employers decline to recognize this association of unskilled workmen. Some assert that the controversy is due to the influence upon the bricklayers of a large fire proofing company that has heretofore been excluded by the agreement between the bricklayers and their employers from contracting for the fire proof work in high buildings. Nicholas Rose, a walking delegate of the laborers' union, has been arrested for offering to call off the strike on a certain building for $250. Part of the money was paid to him in marked bills.—There was enacted in New Jersey last week a bill forbidding the employment of children under 14 years of age in factories, requiring fire escapes for the safety of employees and providing for ventilation and sanitary safeguards in the mills.—The street railway strike in Waterbury, Conn., is recalled by the trial and conviction of Willis Vandemark, one of the strikers, who was sentenced last week to be imprisoned two years for perjury. It was due in part to his perjured testimony

that the masked men who attacked a non-union motorman and killed a policeman escaped conviction, last year.

The Philippine Islands

Peace appears to have been restored on the island of Jolo by the death of Pangliman Hassan, the irreconcilable chief who is said to have been the cause of the recent brief war. His followers, of whom there were at first 2,000, having been slain or driven to the swamps, he sought a hiding place. From this he was dislodged by dattos who submit to American rule. He was then surrounded by General Wood's troops and killed.—In Luzon, Makario Sakay, President of the latest of the so-called Philippine Republics, has been killed, with fifteen of his followers, by the constabulary. Sakay is said to have circulated a letter, or proclamation, after the visit of General Miles to the islands, asserting that the latter had promised that the Democrats would give the Filipinos independence.—At the recent provincial elections 16 governors were re-elected and 11 defeated. In Albay, Captain Betts, formerly of the volunteer army, who married a Filipino, gives way to a native. The elections were quietly conducted, and the number of protests and contests leads Secretary Taft to remark that the natives appear to be familiar with the political methods of our own people.—The Secretary, testifying before a Congressional committee last week, said that the Filipinos were looking forward eagerly to the establishment of a popular legislative assembly. He thought that at first they would be disposed to legislate for the regeneration of mankind rather than in a practical way. There were no American investments in the islands, he said, except in the Manila street railways. After the sale and distribution of the public lands there would be more small farms in proportion to the population than in any other part of the world.—In the House the Senate bill restricting to American ships the trade between the islands and the States has been favorably reported. Secretary Taft told the committee that the ships thus favored would have little or no business unless the tariff should be removed or cut down to 25 per cent. of the Dingley rates.

Another Dreyfus Case

A French officer, Captain Martin, recently received by mistake a letter addressed to a clerk in the Ministry of Marine with the same name, arranging for a rendezvous with the Naval Attaché of the Japanese Legation for the purpose of giving to the latter, according to previous engagement, certain confidential documents o the navy. Martin was arrested and imprisoned, and the Japanese Naval Attaché, Prince Itchijo, has denied receiving any information from him or having any interview with him. One document is reported missing at the Admiralty, and others may have been photographed. A great deal of excitement has been roused over the suspected treachery, on account of the possibility of war in the near future with Japan and the similarity to the Dreyfus case, and the incident will be used as another weapon against M. Pelletan, the Minister of Marine, who is having a hard time to hold his place now against the charges of mismanagement and inefficiency in his department. It is claimed that the letter to Quartermaster Martin, which is in the hands of the police, is signed by Prince Itchijo. Since M. Pelletan is a Socialist and some of his party are avowedly opposed to the Russian alliance, he is the object of suspicion and animosity on the part of many.

French Education

A great many amendments have been offered to the motion of the Government to prohibit teaching by the religious orders, but so far only two of them have been passed. One of them, extending the time for the completion of the change from five to ten years, was carried by a vote of 282 to 271, against the wishes of the Premier, but this defeat is not considered important enough to lead to a dissolution of the Cabinet. The other amendment, restricting the action of the law to France alone, was accepted by M. Combes. It was pointed out that the prestige of France as protector of the Catholics in Asia would suffer if the missionary schools were closed, and that in the English and German colonies the missionaries are very important factors in keeping peace and pro-

moting civilization. France is not so fortunate in her colonies in China and Africa as to be able to dispense with one of the most important instrumentalities employed by her rivals. But it is a manfiest inconsistency that orders should be allowed to teach in the colonies when they are not in their native country, and besides, it would be necessary to permit the continuance of clerical training schools in France for the education of missionaries. This makes a serious breach in the proposed law, one provision of which is that the teaching orders shall at once cease to admit more novices and abolish their novitiates. It is proposed to establish secular schools for the training of lay missionaries for China to take the places of the clericals. The first paragraph of Article I of the new law as passed by a vote of 318 to 231, reads as follows: "Teaching of all grades and kinds is forbidden in France to the congregations." Several amendments were offered aiming to retain for the religious orders the right to keep up the industrial and agricultural schools, which are in many places doing valuable work, but these were all voted down by the usual majority. All efforts of the Opposition to embarrass the Government by interpellations on the conduct of the navy, and by forcing to the front other issues on which the Cabinet is divided, such as the nationalization of railroads or old age pensions, have been unsuccessful. It is evident that the *bloc*, the supporters of the Premier, are determined to stand by him until the anti-clerical legislation is passed.

Cost of French State Schools

The most effective argument yet brought against the project of M. Combes, to force all the children into the secular schools, is the financial one. Urging the importance of this factor the Opposition has endeavored, tho in vain, to have the bill referred to the budget (Ways and Means) Committee. According to the Government estimates presented by M. Buisson, the first cost will be about $13,000,000, and the annual expenditure $1,300,000. The opponents of the measure claim this is altogether too low even for present needs, and that it does not provide for future increase in numbers nor for universal and compulsory education. There are in the French schools now 178,522 children, of which, according to the Government estimates, 75,541 could be received into the public schools as they are. There would have to be built 351 new schools for 1,520 classes at an expense of $8,000,000 to receive the boys now taught by the friars. New teachers would have to be employed to the number of 2,442 at salaries amounting to $700,000 a year. Besides this there are 2,195 private girls' schools under control of the religious orders, containing 199,329 pupils. To accommodate these would require the construction of 748 new school buildings, and the hiring of 2,418 more instructors at an annual expense of $600,000. The cost of the schools is to be divided between the national Government, the departments and the communes. Considering the immensity of the national debt and the heavy taxation in France, this addition to the expense of the general and local government will be very serious.

The Austrian Parliament

The suppression of the obstructive tactics of the Opposition in the Hungarian Chamber through the force and finesse of Count Tisza has enabled him to put through bills providing for the first six months of the present year, and indemnity for the period, May to December, during which the government was carried on without appropriations. It is unfortunate that the method of suppressing an obstreperous minority which has been so successfully applied at Budapest cannot be used in Vienna, where obstruction is being carried on with more than the usual violence and vituperation. Dr. von Körber, in his opening address to the Reichsrath, declared it is "a veritable parliamentary city of the dead;" referring not to the condition of the members, who seem lively enough, but to the immense amount of unfinished business, which there seems no likelihood of disposing of. Besides the usual bills, there are some 60 important Imperial ordinances, including a bill for the relief of the sufferers from the Laibach earthquake of 1895, awaiting action. Dr. von Körber could not be heard in his address to the Chamber on account of the noise

and cries of "Down with Körber," "Insolence," "Shame," by Czechs and Pan-Germanists. As a dilatory motion, Dr. Ryba presented an interpellation on the prohibition of the production at the Burg Theater of "Rose Bernd," a play by Gerhardt Hauptman, by royal command, and introduced as part of his motion the entire play, which he insisted should be read in full. The President of the Chamber prevented this by declining to become responsible for this public reading of a prohibited play. The Czechs were thereupon obliged to fall back on more prosaic methods of obstruction, such as roll calls, while the Germans demanded that strychnine be served to the Opposition, and called upon the spectators in the galleries to break the heads of the Czech deputies when they met them in the street.

Race Conflicts in Austria

The Russo-Japanese war has inflamed the race antagonisms in the Austro-Hungarian Empire, and there are numerous riots and disturbances, chiefly among university students. The "Young Czechs" demonstrate their Slavonic sympathies by meetings and processions, and attacks on the German students in streets and class rooms. The Czech Socialists, on the contrary, are meeting to denounce Russian autocracy, and express their desire for its overthrow. At Prague these opposing factions of the same race, numbering some 5,000 in each crowd, were kept from a street fight by the vigilance of the police, and later three companies of soldiers were called in to keep apart the German and Czech students. The university at Prague was forced to close. In the university at Agram a fight occurred between the Pro-Russian and Anti-Russian Serb and Croatian students, in which a number on both sides were wounded, and the police closed the streets. At Ling a concert by Jan Kubelik, the Czech violinist, was broken up by the Germans, and the musician escaped with difficulty from bodily injury. In Vienna the stone balustrade in front of the university was used as a fortification in the fights which occurred on several successive days between German and Czech students, numbering several hundred, with the occasional assistance or interference of spectators, soldiers and police. The stone balustrade was overthrown in the conflict, and the university was closed to prevent further disorder.

The German Book Trust

Germany, "the land of authors and thinkers," has a controversy on hand between the book writing and the book buying public on the one hand and the book publishers on the other that has assumed national proportions and enlisted the participation of the leading publishers and educators of the country. It is charged that the 6,000 retail dealers, generally known as *Sortimenter,* who have all along been excellently organized, with Leipzig as business headquarters, have quietly effected a union and organized a regular "trust" for their own financial benefit, but to the detriment of the man who writes and reads the books. To meet this combine authors and professors have in practically all university centers organized "*Akademische Schutzvereine,*" academic protective associations, to represent the interests of the book producer, who, according to the new arrangement of things, finds his honorarium grow beautifully less, while the selling price of his books has advanced considerably. These associations have formed a national society, of which Professor Bücher, of the University of Leipzig, is the President, and they have authorized the latter to publish a book, entitled "Der Deutsche Buchhandel und die Wissenschaft," in which the sins of the new trust are handled without gloves. It is charged that the new trust is a danger to the scientific prominence of Germany, as it discourages authorship; that it is unfair to the German book buyer, as it sells to foreigners at rates of ten to fifteen per cent. less than it does to the home trade; that it has advanced book prices beyond all reason, and so forth. Bücher evidently speaks in the name of the learned world of Germany, as these academic protective societies have on their membership roll practically all of the main university men, temporary and slight opposition having been made only at Jena and Heidelberg. Others have taken the same stand, notably Professor Paulssen, of Berlin, in a sharp attack upon the Sorti-

menter for entertaining no higher ideals than that of money gain. Quite naturally the book men could not remain silent under these charges, and the national book dealers' organization (*Deutsche Verlagskammer*) has succeeded in enlisting the services of the veteran publisher and author of Strassburg, Dr. Karl Trübner, to represent its cause, which he, in connection with the President, Dr. Karl Fischer, of Jena, has done, in a special work, entitled "Wissenschaft und Buchhandel." In this volume the whole book publishing trade of Germany, as to its underlying principles and methods, is discussed, with the claim that higher interests than mere financial gains prevail. Statistics are published to show that German books are cheaper than those of England, France and the United States, and that the book publishers of these countries are greater mammon worshipers than are those of Germany. Trübner meets the charge that the publishers are responsible for the phenomenal literary overproduction of Germany, where now annually more than 25,000 books leave the presses, by the remarkable revelation that only about one out of ten manuscripts that are offered are accepted by the trade, so that the book writer and not the book maker is the guilty man. This overproduction problem is beginning to worry German thinkers. The editor of the scientific supplement of the Munich *Allegemeine Zeitung*, Dr. Oscar Bulle, has recently made use of his journal, the most influential of its kind in the country, to demand a restriction of this literary output, the bulk of which he regards as so much trash. Other leading periodicals are discussing the same problem in the same spirit. Not *multa* but *multum* is what these men demand for the publishing interests of the country.

The Russo-Japanese War

The chief events of the war during the past week, so far as known to the public, were the bombardment of Port Arthur on March 22d, and another attempt to block the channel by sinking vessels in it on March 27th. Both attacks seem to have been practically fruitless. Admiral Togo sent two flotillas of destroyers to Port Arthur at midnight on March 21st, and followed in the morning with the main fleet, consisting of six battleships, six armored cruisers and six second and third class cruisers. Part of the fleet bombarded the forts, fleet and town of Port Arthur from Pigeon Bay, and part took shelter behind the ridge of the Lao-Teai-Shan promontory and fired some 200 shells at long range. The "Retvizan" replied over the crest of the hill, and the Russian fleet, consisting of five battleships and four cruisers, passed out of the inner harbor at 2 P.M., when the Japanese retired. The Russians report only five soldiers killed, and claim to have struck one of the battleships with a shell. Early in the morning of the 27th four large fire ships, loaded with stone and armed with Hotchkiss guns, were sent, together with six torpedo boats, to block the entrance. Without waiting for support, Lieutenant Krinizki, commanding the torpedo boat "Silni," attacked the Japanese ships and sunk the foremost by destroying its bow with a torpedo. All four vessels went aground on the right of the entrance without blocking the channel. The ships were at once boarded by two Russian officers, who cut the electric wires which were arranged to set off the explosives. The "Silni" fought the destroyers until the Russian fleet had come out of the harbor, when the Japanese withdrew. The "Silni" was badly damaged and run aground, but was successfully floated again at high tide.—It is still believed that the desire of the Japanese to close Port Arthur is for the purpose of protecting the landing of troops on the western coast of Liao-Tung, and Niuchwang has been placed under martial law, but at the time of going to press there has been no positive proof of this movement. General Kuropatkin has arrived at Mukden, the capital of Manchuria, where he has joined Admiral Alexieff.—According to Russian reports the Vladivostok fleet is still in that port.—In Korea the Japanese advance division is at Anju, which has been strongly fortified, and outposts at least are stationed at points fifteen miles nearer the Yalu. General Meshchenko with about 5,000 cavalry is south of the Yalu and harassing the Japanese operations. The main line of the Russian defenses is said to stretch northward for 30 miles from Fung-whang-ching along the highlands on the Manchurian side of the Yalu.

Leaders in the Far Eastern Conflict

JAPANESE.

THE Mikado of Japan, Mutsuhito, is 54 years of age and has been on the throne ever since he was sixteen. He is a sound and active man of more than ordinary Japanese hight and weighing fully 200 pounds. His family has been on the throne for 2,500 years and he is one of the most firmly established of all monarchs, the whole people bearing him in reverence and love. Much of the credit for the remarkable transition from feudalism to modern civilization, through which Japan has successfully passed, is directly due to him; for, tho Ministers have come and gone, he has steadily and patiently bent men and events to his great purpose of regeneration.

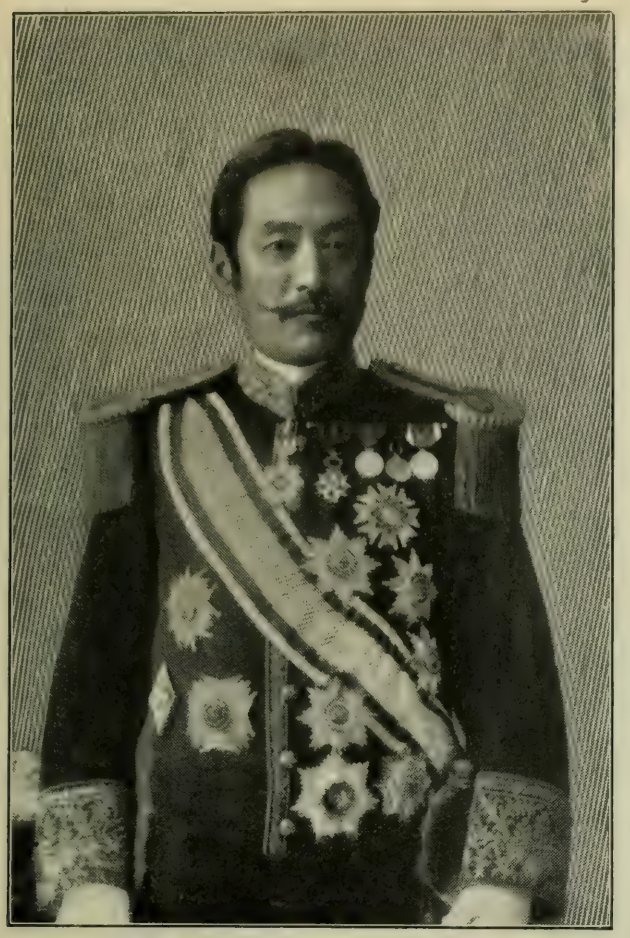
The Mikado is also a very powerful monarch because, tho Japan is a constitutional monarchy, he has a most extensive power of dismissal and appointment, as well as the veto power. All the Japanese leaders in the present struggle were appointed to their places by the Mikado.

The Japanese Imperial family consists of the Empress, the Crown Prince and four Princesses. In case of the death of the Crown Prince the succession would pass to Higashi Fushiminomiya, a cousin of the Emperor, aged about 40 years, who is now serving as lieutenant-commander under Admiral Togo.

The Mikado resides in Tokyo, where he has a great palace, whose magnificent grounds have an area of 8 or 10 square miles.

MUTSUHITO, the Mikado of Japan

Marquis Hirobumi Ito has long been recognized as Japan's greatest man. He is a native of the province of Cho-Shin and is now 64 years of age. Born in poor circumstances, tho of the order of knights or warriors (the second highest class of Japanese), Ito showed such marked ability and application that men of his order and province sent him to England for his education. While in England Ito heard that Japan was about to resist the fleets of America, France and England. He hurried home in time to use his voice most powerfully in dissuasion, representing to the men of his province what he had seen of European and American power and arguing that resistance at that time would be suicide for Japan.



MARQUIS HIROBUMI ITO

Ito was the first Premier when constitutional government was established in 1888. He has occupied the same position five or six times since, and is a past master of the diplomat's art, very skilful in balancing opposing forces and turning them to the advantage of his administration. He has steadily opposed war, and the Japanese generally congratulate themselves that Ito was no longer Premier when the difficulty with Russia loomed large—else, they think, he would have carried conciliation of the Muscovite to an unprofitable extent.

Marquis Ito is now the Special Envoy to Korea, which means that he is the Mikado's representative at the scene of the struggle, with delicate and most extensive Japanese, Korean, Chinese and Manchurian affairs on his hands.

Count Taro Katsura, of the Province of Cho-Shin, now Premier, is one of the youngest of the leaders on the Japanese side, being only forty-seven years of age. He was educated in Germany and has distinguished himself as a soldier. One of the most gallant acts of the Chinese-Japanese war was performed by him when he led his troops of the Third Division of Nagoya across the Yalu River in face of a heavy fire, attacking Mt. Fusan, which was fortified. After the war he was appointed Governor of Formosa, which then had many turbulent elements. The appointment was probably due to Marquis Ito, and the course of events showed it to be a wise one. Katsura put down lawless Formosans with a strong hand and secured order. He became Premier in 1901 and concluded the English alliance, concerning which he had to encounter opposition. Previous to the outbreak of war with Russia he was unpopular with Japanese jingoes, they accusing him of sacrificing or imperiling Japanese interests by his policy of conciliation. This feeling, however, has entirely passed away, and Premier Katsura is now one of the strongest men in the Empire.

Field Marshal Marquis Aritomo Yamagata was educated in Japan, is about 66 years of age and has been a soldier ever since childhood. He was Premier several times, tho he is not reputed a statesman. It was he who organized the Japanese army on modern lines, and he was Commander-in-Chief of the first invading army that entered

PRINCE T. IWAKURA

Korea. While serving in this capacity he disobeyed an order of the General Staff and was recalled, as the General Staff is the instrument of the Mikado, who is Commander-in-Chief of all Japan's forces afloat or ashore. The incident ended with the rebuke, and Yamagata was soon restored to complete favor. He is now chairman of the Council of War in Tokio.

Field Marshal Marquis Iwao Oyama, now chief of the General Staff in Tokio, was educated in Germany, while his wife is one of the Japanese ladies graduated from Vassar College.

During the Chinese-Japanese war Oyama was Commander-in-Chief of the second army of invasion. He captured Port Arthur in twenty days after the army landed and after one day's assault.

Admiral Yukio Ito, Chief of the Naval Board of Council, was born 60 years ago in the Province of Satsuma, which is called the Spart of Japan. In the recent war with China he fought some furious naval combats and ended by capturing Wei-hai-wei, where he had bottled up the Chinese fleet, of which eleven vessels fell into his hands. Japan began the conflict with heavy odds against her on the sea, and the skill and boldness of Admiral Ito were largely responsible for her victory there. Admiral Ito is no relative of Marquis Ito, and their names are spelled differently in Japanese.

Vice-Admiral Heihaichiro Togo, Commander-in-Chief of the Japanese Navy, who recently showed his quality by smashing Russia's Port Arthur fleet, is another Satsuma man, but the whole Japanese people delight in him as their boldest and most dashing sailor. It was he who began the war with China five days before the declaration by firing into Chinese transports that were carrying troops for a clearly hostile purpose, and it was he also who began the war with Russia in the same unceremonious manner.

Togo came very near fighting Yankee ships while in a Hawaiian harbor ten or eleven years ago, before annexation of the islands to this country. There was some persecution of the Japanese there, and the battleship " Naniwa " went to see about it. While she lay in the Hawaiian harbor a Japanese man escaped from prison and swam to the vessel. The

VICE-ADMIRAL YAMAMOTO

Hawaiian Government demanded his surrender and persuaded the captain of the "Boston" to support the demand. The captain of the "Boston," which was one of three American war ships then in the harbor, threatened to open fire on Togo if he did not release the prisoner.

"All right," said Togo, "I accept your challenge." He cleared for action in an hour and maneuvered ready for the fray, but the captain of the "Boston" backed down and apologized. He was afterward court-martialed and imprisoned.

Lieut.-General Baron Gentano Kodama, Vice-Chief of the General Staff, was born 57 years ago in Cho-Shin. He was a friend of Katsura from boyhood, and side by side they have raced for honors. While the war with China prevailed he, as Assistant Minister of War, distinguished himself greatly, having charge of the mobilizing and dispatching of troops.

In 1899 he became Minister of War and also Governor of Formosa, but finding that the Governorship would require all his time, he resigned from the Ministry.

Baron Ganbei Yamamoto, Minister of the Navy, was born 54 years ago in Satsuma and was educated in Germany. He is a man of indomitable will. In 1902 a bill to increase the navy by six first-class battleships in ten years was passed after great opposition on the part of econo-

CZAR NICHOLAS II

mists, including the Minister of Finance, who dreaded the effect of increasing the land tax. This was Yamamoto's measure. He accepted the position of Minister of the Navy in 1901 on condition that Katsura would favor naval expansion.

Lieut.-General Baron S. Terauchi, Assistant Chief of the General Staff, was born in Cho-Shu 54 years ago. He is one of Japan's greatest military educators. He rendered great service during the Chinese war. He was Minister of War in 1902, and is now a member of the Council of War.

Baron Jutaro Komura, Minister of Foreign Affairs, was educated at Harvard, where he studied for five years. He has worked his way through the Government service from the lowest office to the highest. He was Minister to China just before the outbreak of the war with Japan, and left Pekin on the eve of the conflict. Afterward he was Governor of the Liao Tung Peninsula and, still later, Minister to the United States and then to Russia, from whence he was recalled and sent to China at the time of the Boxer outbreak. He advised the Chinese Emperor and Empress against flight, and had much to do with smoothing over their difficulties and securing their return to Pekin.

RUSSIAN.

Nicholas II, Czar of all the Russias, who succeeded his father, Alexander III, in 1894, is a mild young man of 35 years. He is an excellent linguist and musician, a sentimentalist and lover of peace, apparently out of keeping with the storm-clad throne of Ivan the Terrible. At the same time the Czar is not lacking in energy. In 1891, during the great famine, he asked to be made President of the Committee of Succor, and as such was very active. The International Court of Arbitration established at The Hague was his idea, and his also was the proposal that all the great Powers should confer for the preservation of the general peace by disarmament.

The present war with Japan is undoubtedly a great cause of sorrow to the

Czar, who, tho nominally an autocrat, was quite powerless to avert it, being in the hands of a powerful bureaucracy and swept along on the currents of precedent and excited national feeling.

Admiral Ivogeny Ivanovitch Alexieff, whose steady aggressions in the Far East —all the while that Russia was protesting the peacefulness of her intentions— brought on the war with Japan, has long been one of the great figures in and about the present theater of war. He commanded Russia's squadron in the Yellow Seas and never failed, in case of any controversy, to show himself arbitrary and overbearing. He led in the movement to rob Japan of the fruits of victory after her war with China, and has ever since been held in supreme detestation by the Japanese.

Alexieff played a prominent part in suppressing the Boxer insurrection, in the occupation of Pekin by the allies, and in the reconstruction of Manchuria.

His qualities were supposed to include a rare combination of military and administrative gifts, and the whole world was astounded when the first Japanese attack on the Russian fleet found it and the warlike Alexieff utterly unprepared to fight.

The hopes of all patriotic Russians are at this time depending more upon Alexei Nicolaevitch Kuropatkin than on any other man in the empire. He is General in command of all the forces now gathering in Manchuria to fight the Japanese, and his departure from St. Petersburg for the seat of war occasioned extraordinary demonstrations of war enthusiasm and loyalty, which in so many cases took the form of presenting the General with amulets, charms and ikons that he went to the front with a whole carload of these extraordinary weapons.

General Kuropatkin and a Group of His Officers.—The General appears at the right of picture

Kuropatkin was born of noble family on March 17th, 1848, in the government of Pskoff. He graduated from the Infantry Military School and has been a soldier all his life. He was Governor of the Trans-Caspian district and commander of the troops there during 1890-98, and head of the Ministry of War, 1898. Previous to this he had seen much fighting in various fields. He was twice wounded when he stormed Geok-Tepe in command

ADMIRAL ALEXIEFF

VICE-ADMIRAL S. MAKAROFF

of the main detachment. A lengthy and very interesting character sketch of him was printed in THE INDEPENDENT two weeks ago by Josiah Flynt.

Vice-Admiral Makaroff, who was recently appointed to the command of all that remains of Russia's navy in the Far East, seems to have put new heart into the Russian sailors under him. Up to the

GENERAL STESSEL
In command of Garrison at Port Arthur

GENERAL SAHAROFF
Russian Minister of War

time of his assuming direction the Russian warships crouched shivering under the guns of Port Arthur, waiting the renewal of Japanese intermittent attack, and, when it came, spluttering back in a blind, hysterical and ineffectual way.

In place of this Makaroff has actually assumed the offensive. On the night of March 10th he sent six of the Russian torpedo boats to sea to look for Japanese warships. These met the enemy and maintained a hot fight, each side losing one torpedo boat.

When Makaroff saw the Russian torpedo boat foundering he gallantly went out with two cruisers to face the entire Japanese fleet. But he was too late to be of any assistance and retreated.

Makaroff's report of this action says that the crews of all the Russian ships engaged gave proof of remarkable coolness in action. He continues: "The damage to our vessels was insignificant and they are again ready for battle."

Under Makaroff Russia may yet dispute Japan's sea supremacy.

Lieutenant-General Linevitch, Commander of the first Siberian Army Corps, is one of Russia's most distinguished soldiers. He served in the Caucasus from 1859 till 1864, and distinguished himself in the Russo-Turkish war of 1877-78. Like Kuropatkin, he was there severely wounded. Linevitch was in command of the Russian Province of Ussuria, north of Korea, for a number of years succeeding 1895. During the Boxer outbreak of 1900 his intervention saved a company of English soldiers from destruction. After the Boxer outbreak he received the cross of St. George of the third class, which is only given for distinguished personal valor.

General Zassulich, who commands the Second Siberian Army Corps, is a man of great personal bravery. He fought with distinction throughout the Russo-Turkish war and was there severely wounded. He has been decorated with the cross of St. George, and was presented with a gold sword in recognition of his personal bravery and valuable services. His headquarters are at Khabarovka, to which the railroad runs north along the Amur River from Vladivostok, and to which steamboats come eastward from Lake Baikal. If the Manchurian Railroad is cut by the Japanese, Khabarovka, having the remaining western communications, will immediately assume great importance.

Gethsemane

BY MINNIE FERRIS HAUENSTEIN

AGÈD and gnarlèd olives bend o'er Him,
Oh! the shadows deep and the mystery!
Oh! the garden drear and the Crosses three!

Kind solace pour from every branch and limb;
His cup of anguish to the bitter brim
O'erflows; beneath Iscariot's perfidy,
And cowering Peter's sin, spent hopelessly
He gropes and suffers 'mid the wood-paths dim,
And cries, "Am I alone? No outstretched hand
To give me succor that I grief withstand?"
Oh! faithless, slumbrous, unaccounting friends
Small peace your presence to the Master lends.

Oh! the shadows deep and the mystery!
Oh! the garden drear and the Crosses three!

BUFFALO, N. Y.

Along the Yalu River

BY MARGHERITA ARLINA HAMM

[Mrs. Hamm has traveled extensively throughout Japan, China and Korea, and her present article is based on personal observation. She is the author of several books on the Far East, including "Korean Journeys."—EDITOR.]

THE frontier of Korea and Manchuria, running zigzag three hundred miles through lofty mountains southwesterly to the sea, the Yalu River, has been an ancient center of military dispute. The conscientious historians of China will tell you just what wars were waged in this territory a few thousand years back. Ten years ago the Japanese annihilated the Chinese navy in the broad mouth of the river and on land swept the enemy across in their victorious progress to Port Arthur and Niuchwang. To-day the Russian bear and the sacred tortoise of Japan (a swift, newfangled reptile) confront each other on this watery border. The naval drama having been played out, this appears to be the firing line of the two hostile nations. It is certain that Japan, with a fine line of communications to her home base by sea and a newly built railroad from Fusan to Seoul, will not fall back. She has an intimate knowledge of the country from a strategic standpoint, the mountains are in her favor, and she has the benefit of many Japanese colonies thereabouts, established since 1894. It is hard to imagine the tortoise turning tail under these conditions, even if natural valor were not sufficient. On the other hand, Russia, if she cannot hold back or crush the enemy here, runs the risk of being driven from fertile Manchuria to the bleak regions beyond the Amur. At this time Port Arthur is supposed to be practically abandoned and the Russian headquarters at Harbin, four hundred miles from the Yalu. They possess the advantages of their railway system, colonies, military camps and a good knowledge of the region north of the river. It seems hardly possible for them to attempt a repetition of the strategy of 1812, enticing the enemy into a desolate interior. That would mean ruin to the Russians themselves, for the farther north they go the less there is for them to live upon.

Liu Ming Chuan, the Chinese General, in memorializing the throne anent Slavic aggression, said that "Russian mouths were watering for the Yalu provinces," provisions for their colonists, mine and railway workers being derived thence and transported over seven hundred miles to the place of need.

The Trans-Manchurian Railway, of

Scene Along the Yalu River.—Border between the Liao Country and Korea

which Harbin on the main line is the heart, has the following tracks: Kaidalovo to Nagadan, two hundred and eighty miles; thence to Harbin, six hundred and two miles; thence to Pogranitza, three hundred and forty miles; thence to Vladivostok, one hundred and forty miles. The branch line consists of these tracks: Harbin to Niuchwang, four hundred and eight miles; thence to Port Arthur, two hundred miles, and Harbin to Pekin, eight hundred and eighty miles. Harbin is on the Sungari River, where the Manchurian branch of the railroad overlaps the Chinese branch. A missionary just returned from there says that the land for miles around has been secured to Russia, so that there is no possibility of foreigners taking any part in the new colony. Nevertheless, the Japanese Government has knowledge of a Japanese population there of five hundred, and recently their spies have reached home with complete maps of the city and its outskirts. Harbin grew to a commercial city from a military camp. The Russian Jews, who have furnished much of the capital for its commerce, are reported to disapprove of the war and cannot be counted upon to help it financially.

Korean Woman at Ping Yang in Japanese Winter Costume

A former British attaché to the Legation at Pekin says of the railway around Harbin that the track is roughly laid and the line not a first-class piece of construction. Most of the rails, sleepers, girders, locomotives and corrugated iron plant came from the United States, the rest of the rolling stock being Russian.

The traveler notices in Harbin the fine railway offices, the bank, public garden, churches, shops, and for nearly two miles along the Sungari wharves and workshops, which can be put to good use in time of war. Taken as a whole, the Trans-Siberian and its branches, that must be used for transporting troops to the center of war, seem incapable of furnishing complete supplies for a large force; moreover, it is badly guarded at many places, and at the mercy of the Japanese, who have worked upon it in coolie disguise. Therefore, it is necessary to fight upon the frontier.

The country around the Yalu is mostly covered by forests. Its tributary rivers abound in all kinds of fish—carp, pike and salmon, as well as other species. It is a pleasure ground for the hunters of both the Manchurian and Korean borders, wolves, bears, tigers and deer being found. Pheasants, crows, pigeons, thrush and grouse have been shot by them.

If you happen to come across the sportsmen from Phyong-ando, their picturesque attire will add to the scene and be long remembered. Their outfits, besides curious tiger bows and some new-fangled shooting irons, consist of suits of feathers or furs. The bear hunter disguises himself as a bear; the deer-slayer dons a pair of antlers. They are skilled in forest craft and imitate the cries of the prey they seek. The tiger is the only beast they fear, but they hunt him in parties, and, if success crown their efforts, take his carcass home and worship it in the form of rugs hung upon the walls of their huts.

The climate is warm in summer, reaching 90 degrees Fahr., and cold in winter, falling sometimes 20 degrees below zero. Rivers are occasionally frozen from the last of November until the 1st of May. The ground is filled with frost for ten feet during the coldest months.

The Yalu River takes its name from a word meaning "duck's head," on account of the clear color of the water. Emptying into the Korean Bay, it has a great mouth twenty miles long and three or four wide. With its many tributaries, the river is an important highway of commerce. Rafts of timber are floated down from the interior forests, and formerly the Pekin district depended entirely for its timber from this source. Other articles of transport are hides, cotton cloth, oil paper, bêche-de-mer and ginseng. The junks carry the brass work-

Scene in An-Tung, Opposite Wi Ju

ers and miners up and down the stream; Russian freighters convey food and railroad supplies for inhabitants on the Manchurian side; Japanese gunboats constitute a patrol; the Chinese-Moslem and Korean sampans attend to smaller traffic.

Up in the mountains, from five to ten thousand feet in hight, the great vulture soars after its prey, and the wolves and bears enjoy almost primeval solitude. From here in olden times came part of the quota of two thousand four hundred stags furnished each year to the Emperor of China, who deigned to tickle his palate with the choice morsels of the tails. Comparisons might be made with the peacocks' hearts affected by Roman Emperors.

On the Liao-tung side of the river lies the town of An-tung and on the Korean bank Wi Ju. The Manchurian atmosphere still clings to An-tung, tho Russian influence is felt everywhere. Manchu is spoken and the people take kindly to Christianity. The Antungese originally came from the Long White Mountains, and from their numbers have been drawn from time immemorial legions for the famous "Eight Banners," the most important division of the Chinese army. Like other Manchurians, they do not bind the feet of women, and the fair sex have more liberty here than in Korea. They are mostly Buddhists, but they also cherish an older faith, a sort of spiritualism, in which the Fairy Fox plays a large part. The houses are mud-walled and have tent-like roofs. The Kang is used for heating, as in the Hermit kingdom. It is believed that the Russians have considerably improved the old fortifications and massed ten or twelve thousand soldiers here.

As one approaches Wi Ju he is impressed with its quaintness and individuality, even among Korean cities. It is the capital of the Province of Phyong-an and crowns a rising hill on the east bank of the Yalu. Fields, meadows and woodlands surround it, and the native name, "The City of the Spirit of the Hills," seems quite appropriate. A high granite wall, surmounted by watch towers, incloses it. Within the walls the bright tiled roofs of dwellings and temples glitter in the sunlight against a background of trees. Toward the south are the Be-ng-ma Mountains, with their famous gorges, ravines and valleys, while

to the east and northeast rise the Gumgan range, within whose mysterious walls are ancient Buddhist and Taoist temples, nunneries and monasteries. The city is reported to have eighteen thousand homes, and has for years been an important commercial and political community. Its position on the high road or Royal Way to Pekin has given it a history not altogether bloodless. A squire-noble, old and bearded, naïvely said:

"We of Wi Ju have become used to change and war. Every generation sees some strange people sweep over us."

In the old years hostile armies occupied it—Tartar, Chinese, Mongol, Manchu, Japanese. Through it embassies passed to Pekin to deliver tribute, and tradesmen halted on the way to the annual industrial fairs held on the borders. Up to recent times, when natives traveled through Manchuria by passport, it was the only outlet on the northwestern frontier by which they could enter China. The Chinese were forbidden to come into Korea, even by the Great Gate, save when accompanying state missions.

Much missionary blood has been shed here, the early Roman Catholics giving their lives in the attempt to enter the country in disguise. The inhabitants are Koreans, Manchus, Chinese Tartar tribes and a few Japanese. Like all the peoples of the Yalu, the natives more nearly resemble Westerners than either Chinese or Japanese. Tall, strongly knit and of considerable spirit, the men average five feet seven inches in hight, while the women are five feet two inches. High cheek bones, a whitish ecru skin, large dark eyes, gray or brown, very slightly slanting and wide apart, heavy eyelashes, medium-sized noses, almost snub, are chief characteristics. In Wi Ju, however, can be seen the blond and red-haired type quite uncommon elsewhere in the kingdom.

Girls and boys wear their hair parted in the middle and in long braids. Married women brush their locks up from the face and build them into fantastic birds' wing and tiger claw shapes; married men oil and glue their strands into miniature pagodas on the crown of the head. There are class distinctions—the niang-pan, or nobility; civic, or merchants; people, or villagers; farmers and fishermen; the hated, or butchers and leather workers; the slaves and the priests. Yet, with all these, the people will not tolerate the levying of unjust taxes and burdens practiced by the nobles of the south. One sees signs all about the Yalu concerning the fate of the Niang-pan, who press the people beyond what they deem right.

Up the river from Wi Ju are the settlements of Chang Song, Pyokdong, Chho-san, called the Beehive, the center of the honey industry; Wi Won, Ondong and Cha-song. Smuggling is seriously punished in this territory, beheading being the usual sentence. Ancient pencils of hare-hair are found here, and ink made from pine soot.

While Mohammedans and Buddhists have made small numbers of converts, a sort of devil worship is the principal faith. Devils are supposed to be the cause of all evil and disease, and the devil-doctor, or sorcerer, is in great demand to drive away the spirits of darkness. The educated classes imitate the Chinese Confucianists and make ancestral worship their religion. Christianity, from late reports, is well received by the people, and there certainly seems to be a great field for it. That the younger men possess ambition is proven by the number of pilgrim scholars, bound for the examinations at the capital, met with on the imperial highway. There are three degrees fitting students for public office. The highest prepares him for the King's immediate household, the second for government in the Provinces, and the third for places in the bureaus. The learned form a class by themselves and seldom intermarry with others.

In Phyong-An province, bordering the Yalu, which has a northern and southern division, many Government offices are hereditary. The highest degree confers no Government position upon Northern Phyong-An. The sacred city of this province, Ping Yang, on the Yatong River, was the best defended point in the Chinese-Japanese war, and these defenses will no doubt be used by the men of Dai Nippon, who now command this stronghold against the Russians. The walls are of heavy white stone and bear evidences of many wars. The Sunjo

gap commemorates the heroic escape in the fifteenth century of the King from the victorious Japanese Daimio. In an outlying district are the ruins of King Kitja's palace and the tombs of the royal families. This was once the scene of court grandeur, victorious pageants and festivals.

Altho Ping Yang has grown industrially since 1894, it is still far behind Seoul, Fusan and other cities to the south. If you enter it on tomb-cleaning day you will take part in one of its greatest fêtes. In fact, mourning seems to be its supremest recreation. Some so-called foreign-devil houses have been built within the last five years, but the old homes make up the majority of abiding places. They are of wood, stone or mud, with roofed gateway and smaller house in the first wall; a compound and second wall with covered way leading into a series of compounds and houses, the number ranging to suit the purse of the owner. The floors are raised a foot or two, and into this space passes smoke from a fire in the cook house. The smoke is carried through to a flue and passes out of a chimney built up the side of the dwelling. The interior is partitioned off into rooms. The windows are of oil paper, and over the top are banners, resembling those seen in China, with bright characters representing old proverbs or prayers. The walls are often plastered with a beautiful terra cotta mixture, which gives a rich tone and matches the great jars that stand in the four corners. Tiger, dog and bear skins cover the floors. The rooms are lighted by fantastic-shaped wicks floating in oil, stately candlesticks or Chinese lanterns. The family eat from a *sang* on the floor, men and women being separated. The tablecloths are of cotton paper, with grotesque designs. Chopsticks and spoons are used. The dishes are queer in shape and pattern, but prove the assertion that Japan got her art of porcelain decoration from the Koreans. Beautiful old chests, ornamented in silver and brass, stand about the room, filled with treasures in china and porcelain, that are used for funerals, weddings and such family reunions.

A Chinese Execution in the Yalu Region, Manchu on Horseback

The bill of fare is not as unpleasant as in some isolated countries. It may include dried fish soused in vinegar and ginseng, chicken, beef, pork, venison, beans, rice, maize, mochi, kimchi—a national dish made of turnips, chillies and dried fish—tairi, pears and grapes.

As you pass on from Ping Yang toward the seat of Government, Seoul, you may hear the native soldiery giving orders in Russian. This brings back forci-

bly the subtle Muscovite influence, for just after the war of 1894 the Great Bear presented rifles and a Russian drillmaster to the army of Korea—five thousand men at the capital and some two thousand in the provinces.

New York City.

Chinese Soldiers Who Took Part in the Battle of Ping Yang in the Chino-Japanese War

An Easter Child

BY THEODORE ROBERTS

IT was Easter Sunday, and blustering, nipping weather in that northern harbor. Captain Pike, honest mariner, had been dragged from his vigil in the frozen garden, by the doctor. "Cheer up, my lad," said the old doctor. "They are both as safe and happy as you and I. She'll be seeing the mermaids and the fairies, will that new daughter of yours; and there is no saying what other fine things, considering it's Easter Sunday, and that she was born with a caul over her face."

"She'll be lucky in love, too," said the captain. "At least, that's what folks say along the coast."

A model of Pike's barquentine stood on the shelf above the hearth, supported by two branches of coral. A sea porcupine hung from the ceiling. On the walls were pictures of ships, barques, schooners and all manner of craft, all under full sail, ploughing the blue and white seas of lavishly daubed paint. The captain looked about him at these familiar objects as if he had never seen them before. The doctor seated himself in the most comfortable chair in the room and sighed contentedly. With his glass at his elbow he talked about politics, trade and human nature, and his host made absent-minded replies, and fidgeted in his chair. The broad smile on his tanned face denoted nothing of understanding. What were trade and politics to him? The price of fish meant no more to him then than the rental of detached villas in Clapham. He grinned, and forgot his liquor, and kept an expectant eye on the door. Presently it was opened by a middle aged woman in a gray stuff gown.

"She wants to see you, Cap'n," she said. Pike, for all his size, went past the nurse and up the stairs like a bird.

* * * * *

The years passed. Captain Pipe prospered. The Easter child grew through childhood to dainty girlhood, and Archibald Duff came to the harbor. He came with Pike, in Pike's own vessel, as mate. He had been shipped in Demarara, where the former mate had died of fever. He did not look like a "shell-back." His figure was slender, and not much above the medium hight. His face was dark and clean shaved (if indeed, it required the razor) and his manners were as delightful as those of a well-bred woman. He was hardly out of his teens, but he held a master's certificate, and, as

Pike himself confessed, knew more of navigation and seamanship than any other man aboard the "Flying Wave." He was evidently a gentleman, born and bred; a wearer of fine linen, and a user of clean language, but even Pike knew nothing of his people or his past. He came to the harbor in the "Flying Wave," and when all was made snug aboard he ascended to the white cottage above the village, to take tea with the skipper. Twilight was falling by then. At the narrow gate of the garden he turned, like a good sailor, and looked toward the harbor, to see if the light was in the fore-rigging of the barquentine. Facing the cottage again, he found Pike waiting at the open door to welcome him. A ruddy light glowed behind the stalwart shoulders. The mate's heart warmed with more of happiness than it known for a twelve-month.

Duff had often heard of Margaret from her father. Her praises had been sung on many a white night in the tropics, during the moon-lit watches when the skipper could not keep to his berth. He had shown polite interest, but down in his heart had smiled at the foolishness of a doting parent. Now he met her in the fire-lit sitting room, into which Mrs. Pike and the captain had led him from the lighted entrance. As she came toward him, her face in shadow, and the light on her hair, he wondered for a moment if some dream-wave had washed him back to those lost days. The clasp of her hand was firm and comforting. Her greeting was—well, the words were commonplace enough. It was the voice that set his hard hand trembling like a coward's. He saw that, tho so young, she was as tall as most women. He could not see her face distinctly in the fitful light, but it came to him that this Easter child, this sailor's wonder and boast, was no village simperer. It seemed an age to him since he had been in the same room with a girl like this.

The brass cabin lamp was lighted, and, while the two sailors and Mrs. Pike sat and talked, Margaret laid the cloth and got out the blue and white china. Then a shapeless servant brought in the dishes from the kitchen, and the mate blushed at the sight of her, for such as she was he had expected to find the captain's daughter. During the meal he forgot many bitter and mean things. The china felt dainty and familiar to his hand. The cloth was white and spotless. Two silver candlesticks stood among the shells and corals on the mantelpiece, one on either side of the cherished model of the "Flying Wave." The rugs were thick under foot. The sideboard, of choicest mahogany, caught the light like a pool of brown water. The mate looked about him and across at the girl, and decided, without thinking about it, that life was still a desirable enterprise. He talked, and as the woman and girl listened with sympathy and interest, Pike looked on in wonder. The quick smile, the attitude of courteous deference, the well chosen words,—all had been half seen and partly suspected by the captain, and now flowered before him unrestrained. Quietly attentive, with his gaze shifting kindly from face to face of the three, he learned more of his mate's thoughts and past life in twenty minutes than he had during the whole voyage up from Demarara. He noticed the light in the gray eyes of his Easter child, softening and brightening their grave regard of the stranger. He watched his wife's comely face, touched with an eagerness that brought him no pang of jealousy. His eyes dwelt upon Duff. This was his quiet, fair-spoken messmate sure enough, but how changed. Across the befiddled table of the "Flying Wave" his talk had been sociable enough, but all of the ship, the day's work, and the moods of the sea. The cheer of the cottage room and the attention of the women seemed to have thawed his quiet reserve, and he talked about people, and places, and told stories of the days of his early youth at an English school. Pike had never heard that he was from one of the big public schools —those institutions that stand so for respectability, even in the colonies. He might have guessed it, he thought.

"Where did you pick up your navigation?" he asked, without preamble.

Duff turned toward him, and a shadow of pain stilled the merriment of his eyes and mouth. Silence held the little company for a couple of heart-beats. The young girl, wondering at the change, turned startled eyes upon her father. Then Duff laughed.

"Did it seem that sort of navigation—the kind one would pick up?" he asked, smiling somewhat pensively at the captain.

"Never met with better, my lad," replied Pike, "and I put the question out of idle curiosity. You see, tho good men and capable seamen have sailed mate with me before now, you're the first—well, you're the first of your kind."

A flood of color crept over the young man's dark cheeks, and he leaned toward his hostess. "I should have told the captain before, perhaps, I was trained in Her Majesty's Navy," he said.

"Ah!" exclaimed the captain.

"Last year, in April, the firm of Duff and Delancey, in Kingston, was crowded out—ruined—crushed by a lot of—"

Pike got out of his chair. "I know it," he cried. "The straightest people in the islands, were Duff and Delancey. And Old Duff — that wouldn't be your father?"

"My grandfather. He died worth six pounds odd," remarked the mate, quietly.

"I knew you for a gentleman first time I sighted you," cried the captain, "and a fool I was not to guess the rest. The navy! Lord, I might have known it, the way you made those men jump, and just staring a bit, where I'd be swearing like a Gloucester skipper." He looked at his wife with a deny-it-if-you-can glance, and slapped his big hands on the table in front of him. Duff's eyes met Margaret's. Her's were bright with sympathy. In his shone merriment—or was it tears?

"I have heard of lovers being parted," he said, whimsically, "and read lots of verses about the pain of it, but a year ago, when Fate, in the garb of poverty, tore me from the navy, a lover's troubles did not seem worth reading about any more."

"I believe you, Mr. Duff," said Pike, "tho I've never tasted the navy, and tho I know that lovers' troubles—just little jib-fulls of dirty weather in those latitudes—are bad things." He looked at his wife, and she, remembering some incident of their early courtship, smiled very tenderly and nodded her head.

By this time the sudden shadow had entirely cleared from the younger mariner's face.

"One requires a little pocket money in the navy even in a second-class cruiser on the North Atlantic station," he said, lightly, "so when the supply gave out I got my master's ticket for luck and then tried gold digging in Demarara. That is what I was doing up to the time I joined the 'Flying Wave.'" Then he returned to the description of a cricket match, in which he had taken part at the age of twelve, and the three felt that, for the time being, at least, the subject of his change of life was not for general conversation. Pike returned to his meditations and kindly survey of the table; his wife poured herself another cup of tea and Margaret's eyes recovered their normal expression.

The "Flying Wave" was without freight for two months. Archie Duff remained all that time in Staysail Harbor, for he intended sailing the next voyage with Captain Pike; and in the meantime he found the little village exactly suited to his mind. It was out of the world he had known—so far out that not so much as an echo of its jeers and laughter reached him. It was a good place in which to read, and dream, and save one's money. The sea was at his door, and without that the fairest place on earth would have been a desert to him. It contained three people whom he looked upon as very dear friends, and several hundred kindly fishers and seafarers, who were picturesque, and who did not disturb him. A few miles to the north ran a brown trout brook, where a well-cast fly seldom lit unheeded. The barrens behind the village often lured him inland for miles. He lived, for those eight weeks, with the Pikes, and sometimes the captain and Margaret accompanied him on his rambles, and sometimes Margaret alone. Margaret owned a sailboat which she managed with fearlessness and skill that awed the women of the village, and in this little craft she and Duff often sailed for miles along the coast. The boat was an open skiff, with lavishly tarred sides and battered thwarts, and a tanned mainsail and jib. She sailed well, and, if need were, could be rowed easily. She carried a home-made grappling anchor in the bow—a queer looking creation of stone and wood. In spite of her looks she was always kept in a seaworthy condition, with

sheets and halyards to be trusted, sound spars and a sure helm. Margaret delighted in these coastwise cruises. With the red sail tight in the wind and a bit of head on the sea, and with Duff minding the sheet, the rugged coast seemed to her the Coast of Dream, and in every narrow coast she looked to see a mermaid flashing white shoulders and golden hair amid the spray. If the wind were easy Duff would read aloud,—he had brought many books with him out of his lost past. Sometimes it was Malory's "Morte D'Arthur," and listening, Margaret wondered if the gentle knight, Sir Dinaden, might not have had eyes and chin such as this sailor lad's. Often it was verse that he read, and that was always modern, and held the girl's attention like an enchantment. How some of these strangers had caught the spirit of the morning and the sea, as she had known it all her short life.

Word came to Pike to work the "Flying Wave" around to St. John's, and there take in seal and whale oil for England. Margaret heard of it with admirably concealed dismay; Duff, with hidden delight. He wanted a few new books and some clothes. A week in town would not come amiss after all the months of orderly quiet. He had spent a Christmas week in London, when he was a small boy at school, and now the memories of it grabbed at his heart. He had then had, much against his wishes, a respectable middle aged uncle for guide; but as it was not at all likely that the uncle would offer his services again, he expected to have even a livelier (if not a better) time on the next occasion. This mood did not last long, however. He began to wonder if even London would look as enchanting to the mate of a barquentine as it had to the eleven-year-old kid from school. He wondered about the doors that had been opened to the school boy and the respectable uncle—would they swing as easily to the hand of the poor merchant marine? He doubted it. Then the thought of leaving the snug white cottage, the coastwise trips in the skiff and the peaceful oblivion of the trout brook pricked him with regrets. He would miss Margaret, too. It came to him that she had rather unusual eyes, and a voice not to be forgotten in a hurry, even by a sailor, and that she had always proved herself what he called "a good sort."

The "Flying Wave," was ready, and the mate had a day's grace. Early in the morning, before breakfast, he went down to the little float and overhauled the sheets and halyards of the skiff. By eight o'clock, with the sun like white fire on the water and the cliffs warm and purple, the little craft won out of the narrow harbor and skimmed northward. Duff and the girl sat aft, side by side. Her hair, usually worn in a long braid, was coiled under her cap, for a blowing braid a yard in length is sometimes in the way when dodging a jibing boom. Duff saw in her eyes shadows, and a softening of light, before unnoticed. When her hand touched his on the tiller, as it had done maybe a dozen times on former occasions, he felt a new pleasure and an unusual confusion. A man who has had his training in the gun room of a British war ship is not easily confused. He fell into a gentle, attentive silence, and Margaret, with rare color in her cheeks, laughed and talked. Thus they made a mile or so, skirting the coast with a shifting wind. On the port beam the purple and brown cliffs unfolded, and spray-edged coves opened and closed to their view. Starboard flashed the green water, traced with wave heads; and farther seaward the blue deep, partially silvered by the sun, glinted out to an uneasy horizon.

The wind strengthened, and shifting a point or two, held roaring upon the coast. Duff reefed the mainsail and stowed the jib. Scrambling aft again, he offered to take the tiller from the girl. She shook her head. Her eyes danced with the excitement, and strands of pale hair blew across her face. "I know the coast—we must run in for the next cove," she cried, with her lips at his ear. Looking seaward, Duff noted the black, tumbling waves along the darkening skyline. Turning his head, he saw, with dismay, the thrashing tide and puffs of spray along the cliffs and narrow landwash. For a second his lean face lightened with the joy of the danger; then he remembered his responsibility, and the muscles of his jaw hardened under the brown skin. The wind, now roaring

upon them with ever increasing violence, held a note of rage—a suggestion of personal spite—in its shrieking clamor. The skiff, lying over with lee-gunnel awash, strained like a fugitive from fear.

A little sheltered beach, a haven in that line of battling, flying surf, opened to their view. But this quieter water was sentineled by two huge rocks, now awash with the green seas and now rearing brown and high, and the only approach was the "tickle," or water way between them. The tickle was narrow—a ribbon of black, swirling water between leaping waves. Duff's gaze questioned the girl. She nodded, and the skiff swung in. Duff crawled forward and took up an oar. The red jib beside him split and flew in strands. Above the roaring of wind and surf he heard the boiling of the current in the tickle, and the frenzied singing of the waves under the skiff's buried bow. For a few fearful seconds he wondered if the girl's hands were true enough and strong enough—then he was in the water-swishing between the rocks—battling with green seas that leapt upon him from above. Margaret's courage had deserted her at the last.

Duff dragged the unconscious girl out of reach of the water, and, stumbling dizzily, at last sank beside her upon the shelving landwash. It had been a mad fight. He had been hurled against one of the sentinel rocks. Weighted with the stunned girl, he had been pounded beneath the surface a dozen times by the maddened seas. Upon reaching the stiller water his strength had just sufficed to win him to land. Now it ebbed away from him like spilled blood. Minutes passed, and at last remembrance of the accident returned to him. He opened his eyes and looked straight up at the soft, white curves of Margaret's throat and chin. One of her hands brushed lightly across his face and patted his cheek. He realized, with a sudden glow through his benumbed body, that his head rested in her lap.

"Margaret," he said, without moving.

She started, ever so slightly, and bent her face over his.

"Are you hurt?" he asked.

"No," she replied, "but what a coward I was, to faint. Are you hurt, Archie?"

"Only fagged," he said, and his eyelids fluttered down again.

"Here is your flask," said the girl, "and don't you think you could drink a little of the brandy now? I tried to give you some, but it ran all over your face."

She held the flask to his lips and the stinging, raw liquor steadied his head and set his blood racing. He got to his feet and found that no bones were broken, tho his right hip was stiff and sore.

"Are you good for the walk?" he asked, looking away from her at the foaming tickle and a patch of red sail washing between the rocks.

They found a rough path leading to the top of the cliff. Slowly, and in an unusual silence, they set out toward the village. Their way ran over brown moss, high above the creaming breakers and in the sweep of the wind.

It was past noon when Duff pointed southward at a dip in the cliffs where the village nestled. They could see a flutter of white in among the brown and purple of the hills—the royal and topgallantsail of the "Flying Wave," drying in the wind. Margaret paused and gazed at the unconscious signal of cheer with dimmed eyes.

"I should have given you the tiller! Instead of that I risked both our lives—and you saved them," she said.

Duff looked at her, flushed, and laughed awkwardly.

"My dear girl," he began, lightly—then, altering his tone—"I'm sure I couldn't have run her through without capsizing, and as for the rest of it, why I'm glad you gave me a chance to—to help you ashore."

He caught one of her hands and hurriedly kissed it.

They finished their rough journey in rare, light-headed silence, their eyes never meeting for more than a heartbeat, but often seeking one another.

They entered the rocky garden, bleak and bare. The girl was very white; a slight trembling caught her limbs as she looked down at the harbor and marked the wash of the gray seas against the sides of the "Flying Wave." Archie followed her gaze, but saw nothing of ship or harbor. His heart was throbbing so; and his foolish brain struggled with

his heart. His heart cried for comfort, and for some assurance of love to straighten it through the lonely watches beside the ghostly mizzen. The brain whispered something weak and cautious —the fearful reasoning of a coward.

"Margaret," he said, slowly, "I cannot go like this. A man's heart must be brave and ready, to face a voyage—and mine is blind with doubt. I am not strong enough to do as I should—as a better man would do in my place. Every mile of water between us would weigh on me like death. Had I your promise to cheer me across the lonely months—" His voice, eager and gentle, rose a little at the last words. He leaned forward, but made no effort to touch her.

The door of the cottage opened, and the captain smiled out at them. Margaret glanced at him, with a rare smile at eyes and lips. Then she placed her slim, brown hands on Duff's shoulder.

"If any promise of mine can cheer your voyages," she said, "then I am the happiest woman in the island."

The mate drew her gently toward him and kissed her lips and her eyes. He had no words for this wonderful occasion—indeed, he felt no need of them. Across the soft veil of her hair he saw the rugged harbor radiant with light; the old barquentine riding at her cable like a glorious argosy; and across the waves, in finest harmony, drifted the lilt of a forecastle song.

The captain stepped back and closed the door cautiously. His mouth was smiling, but his eyes?—there were tears in them.

BATHSHEBA, BARBADOS, B. W. I.

An Old-Fashioned Spring

BY E. P. POWELL

AUTHOR OF "OLD FARM DAYS," ETC.

I HEAR a good deal about an Old-Fashioned Winter, but not often of an Old-Fashioned Spring; yet the latter was more unique than the former. It began in the January thaw, when we not unfrequently had a warm spell of three weeks, during which the plow was put into the uplands. These were openings in the solid forest, and on three sides the beech trees stood unbroken. The few acres of cleared land made a sunny sward that dried very easily, but it was pretty well filled with stumps, and occasionally a charred shaft standing twenty or thirty feet high. While the plow was at work we boys were kindling fires in the stumps, which we gradually reduced to fertilizing ashes. Harmless snakes would run out, thrusting their tongues at us. So it was that plot after plot of virgin forest became meadow or corn land; and there was a deal of sweetness in this simple pioneer preparation for crowding civilization. We came for the most part from Connecticut, and we had Connecticut ways and notions to the brim; but we were full of poetry, too. Our work was always with two things, worship and play. My father's custom was to quit his work an hour before sunset, that he might spend the time with us, studying the little things of Nature, over the knolls and among the trees. This January thaw is mostly now a thing of the past. The equalizing forests are so cut away that cozy nooks are widened out into great landscapes, and the sun has no chance to make the hillsides brown in midwinter.

Hardly was this episode over when it was time to bring out the spiles and tap the maple trees. We did not have far to go, for the forests came close down to our homes and hugged us under their shelter. The spiles were made of elder, with the pith pushed out, and one end sharpened to drive into the tree. The holes were bored with a half-inch auger, two of them about six inches apart and

three feet from the ground. Under the ends of the spiles we placed all sorts of pans and kettles, until there were hardly enough pans in the house to hold the milk. Three times every day these were emptied into pails and carried to the big iron kettles that hung over the fire down in the hollow. There was not a match in the world in 1830; we had to light our fires with coals from the kitchen stove, carried between two pieces of curled bark. Often we had to run hard to keep the coals from going out before we could get them to the woods. Occasionally we boys would stop to blow them, and sometimes we had a stumble that sent us back on our errand. Ah! but that was fun, when we handed the coals to the father, and he, with nice woodcraft, placed them among the splinters of dry hemlock or bits of sumac wood, and blew till they crackled among the twigs. Soon the fire was burning and eating up great sticks of maple and logs of beech that were skillfully piled under and around the two kettles. The first kettle took the fresh sap as it was brought in the pails. This was constantly skimmed of bits of wood and leaves, until it was fairly clean. The second kettle took the thickening syrup; and this must be carefully watched lest it boil over. A careless boy would let go to waste a whole day's boiling. As soon as thick enough the syrup was carried to the house to be cleansed, and still farther boiled, until it was brought to the sugar grain. At all stages I assure you that boiling maple syrup has a delight peculiar to itself, for it must constantly be sampled—and that is what boys were made for. A couple of eggs broken in caused the dirt to rise, and this was skimmed off, to be poured into the vinegar barrel—for in those days there was economy. We wasted nothing, and there is no such vinegar as that which comes from honey waste and defective maple sugar.

Overhead the woodpeckers tapped as busily as folk below; and the yellow-bellied sort did it for the same purpose—he liked sweet sap. Yet I do not remember that then there were trees killed by their overtapping, as there now are. But we did not miss a few trees when the forest covered more than half the land, and we could hear the beech leaves rattle when the wind blew. Most of the woodpeckers are entirely harmless and positively helpful. They have so long been regarded as friends that they have lost fear of man. In those days there was an unwritten law that woodpeckers and robins must never be killed. I think bluebirds were also immune until women took to wearing them in their hats. Most of the other birds did not fare as well. We did not understand them or their place in agriculture. Insects have since then increased enormously, and the fight would be hopeless but for our bird alliance. Just now I see the nuthatches and chickadees running all over my trees to hunt the eggs of pests. I have fed them all winter with pieces of suet hung on my trees and porches.

I think in those days we made more maple sugar in February than in any other month, and the rest in March. We made enough for our whole home supply, except a little New Orleans molasses for ginger bread and cookies. It was fine in midsummer to go into the big pantry and take a lunch of maple sugar, with bread and milk. We had not then heard about bacteria, and we fearlessly ate our fill or more. By April we were in the thick of spring work, as a rule. But sometimes the snowstorm found us out as late as May; and I remember a bit of doggerel that ran

> "The twenty-first of May, so they say,
> A snowstorm put the plows away."

The robins were looked for about the fifth of March, and the bluebirds a few days earlier. I still wonder that the robin was then so great a favorite, because no other bird did so much to prevent us from getting a crop of cherries and berries. I think it was because he was the harbinger of warmer weather.

But to me the flight of the bees and butterflies was even more welcome than that of the birds. My father kept one hundred hives of bees, a few of them in the old cone-shaped straw hives. When it was warm enough for a quick run of sap the bees would take a flight for health as well as food, and not a few would be tempted to fly over the snow banks and never get back. They came to the maple grove, where they sucked chips and buzzed their happiness. There

was enough to study as well as to do, and I look back to those days in the spring woods with a query if our lives are not now too much cut loose from Nature. At any rate, the huge town is a huge blunder—it gives no compensation for the pleasures that were ingrained with the toil of simpler life.

Snow banks lasted in those days until June, in the deep glens, where the dense shade kept out the sun and the heat. But the days were constantly growing longer, and the sun lingered at night, as if it did not care to leave the greening buds to the care of frosty hours. Lemon yellow skies! distinctly not golden—and full of wind! What a wonder such an evening is! The air is clear and a gentle tonic! It is life-full, and the earth and all on it is instinct with growth. Such an evening as this we pulled open the seed drawer and examined our resources. This was not a matter of indifference, as it is now. There were in those days no great seed houses, whose packages could be bought at any village store. We grew our own seeds, as we grew our own roots. A new variety was carefully treasured, and we generously divided with our neighbors. It was a delighful hour when we grouped ourselves around these household treasures. There were seeds of the old-fashioned clove pinks, bachelor buttons, lady slippers and musk mallows. All these were carefully divided into little parcels, which went here and there about the neighborhood, to make warm hearts and bright eyes as well as beautiful garden beds. There was not yet a pansy invented, nor a gladiolus; and as for sweet peas there was just one variety. But among garden seeds we had the blood beet—to my notion better than any modern improvement—and we had such lettuces and cabbages as satisfied our generation.

About the first of April was the time for bonne-fires. All around the horizon they spoke out to each other just as daylight deepened into dusk. Old and young shouted and worked together from seven until nine, and the waste, which had been raked from lawns and gardens, was flung upon the burning piles. The whole air was instinct with life. Even the smoke itself was humorous, for it chased us about, no matter which way the wind blew. It is not easy in spring to get rid of the notion that everything is happy—that the air and the brown earth and leafing trees and the grass, and the bonne-fires themselves, are rejoicing together because spring has come. Spring is life—new life—and it throbs through all Nature. It was always in the early morning that we heard the call of first arriving birds—and it is so to-day. One must listen sharp to hear the whistle and the reply far away across the orchards. They have a line of couriers far along toward the north land. What are they saying? But at night they began their songs. When the bonne-fires burned, a robin would perch on a spruce and sing one of those universal songs of Nature which only the robin can sing. By April twentieth the swifts had come, and, as nowadays, were skimming the evening air for insects. Barns were not then built as we build them, but the boards were far enough apart for the swallows to go in and build nests on the rafters.

But of evening sounds I think that which most fascinated me was the not unmusical call of the frogs. There were more ponds in those days, and wet swales, where these Johnnie-Jump-Ups of the water had undisturbed possession and made the night hours hilarious and resonant. I have a neighbor to-day who tells me that to his notion the frogs sing sweeter than the birds. He has a small pond near his house, hung all over with great willows. Come, he says of an evening, let us go to the frog concert; and we sit there on rustic seats and old logs, and I am not ashamed to say that I enjoy the concert as much as he does himself. It is a cure for insomnia.

Sometimes during April, two or three weeks earlier than in these days, there came into the house aprons full of hepaticas and anemones. It is wonderful how much these little flowers have to do with human happiness, especially with children's lives. Nature understands this, and makes millions more flowers than are needed for any practical purpose. Yet I believe people have succeeded with rooting out and absolutely destroying a good many kinds of wild flowers, as they have of wild animals. I should really like to sit down to-day with the editor of THE INDEPENDENT, under

an old apple tree that I remember, and "fight" blue violets. It might be just as well for both of us as to be trying to keep up with this strenuous age. Just hitch the two violets together and gently pull until one or the other is decapitated. How much like the competition of modern life, both in the manner and the advantage of it.

In those dear old days we got more of our living out of the fields. I cannot think of spring as any way complete until we have had a dish of dandelion greens. We used to pile them up on a big platter, all around a huge piece of boiled pork. No part of our dietary can be too divine to discard the delicious dandelion—when cooked by a wise woman, and eaten with a flavor of lemon and sugar. "God never made one too many dandelions." Very possible—if all the people could get at them. Will not some millionaire create a fund to distribute a bushel of these luscious leaves to every family in America? And why not? There is in them health and sobriety and happiness. The nonsense of drinking spring bitters can be comprehended only when you get the dandelion itself on the table.

Now at last the butternuts are leafed out, and spring has finished its procession. Nothing is more interesting than to notice how every plant and tree has its own time for doing things. As for the butternuts, they always wait for the white ash, as the ash has waited for the maples and the elms. It has taken all of two months to get through with the budding and the leafing out. The uplands, where we begun our spring work, were lots nearly surrounded with forests, and generally a few butternuts had been left scattered about, or along the street side. These gave to us and the squirrels lots of fun and food. All around the edges of these hill clearings, on little knolls, grew wild strawberries. How lucky it was that New York City in those days was big enough at fifty thousand inhabitants, else they could never have tasted strawberries. For my part, I am sure I have never eaten any other berries as fine as those that I pulled out of the bunches of mint, on stems seven inches tall, or spoiled the meadow grass by hunting for them. Round and round the horses drew the plow, through the just sprouting corn and potatoes, until the shadows reached half across the fields. Then the good father put in his team, and called us from the house. We were all soon marching together, here and there, until our baskets were filled with berries, some red and some white. Then we went dancing homeward, discussing to-morrow's shortcake,—until we met the little mother at the door, who clapped her hands with delight. Ah! those were days—honest, clean, and nothing at all to blot out. No, we did not have to ask for a shortcake; for, indeed, the women of those days were proud of nothing else so much as of cooking. We were all one—we were a family. Mothers voted all they pleased till we were twenty-one, and taught us how to vote after that. I should like to see an Old-Fashioned Spring.

CLINTON, N. Y.

Pasque Flower

BY CLIFFORD LANIER

"I WOULD that I could see Thee, God!" "No man
May look upon the face of *Jah* and live!"
The light of Easter's laughing beauty ran
All o'er the land: What splendor might He give
In lovelier form? What joyance could I ask
More fair than spring's surpassing Godhead Masque—
Heaven-blown Anemone a-shine this Pasque?

MONTGOMERY, ALA.

White House Portraits

BY JANET JENNINGS

THE portraits in the White House of twenty-four Presidents may be called an official collection, as the portrait of each President in turn is placed in the White House by authority of Congress, after the President has retired from office. The portrait of President Roosevelt, recently painted by Sargent, adds one more to the number, tho not yet included in the official collection.

The portraits of women in the White House are few in number. There is little to be said about them except that indifference counts for much in lack of sentiment, which would hold in tangible memory women who, more or less helpful, shared with Presidents many duties of the highest position in the gift of the American people. The wives of eighteen Presidents have been mistresses of the White House—nineteen women, including President Tyler's two wives—Mrs. Letitia Tyler, mistress of the White House a year and a half, and Mrs. Julia Tyler, who went into the White House a bride in the last year of President Tyler's administration.

The wives of five Presidents were never associated with the White House. This does not, of course, include Martha Washington—the first—"First Lady of the Land," in New York and Philadelphia, respectively, the seat of Government in President Washington's two administrations. President Jefferson's wife died nearly twenty years before he became President. President Van Buren's wife and President Arthur's wife had been dead several years when they went into the White House, and President Jackson's wife died a few weeks before his inauguration. When President William Henry Harrison was inaugurated his wife was not able to go to Washington. His death, one month later, was a great shock and Mrs. Harrison never entered the White House.

There are but six portraits in the White House of women who have presided over the White House. Not one was purchased by Congress. All were gifts, therefore they cannot be regarded as an official collection. Five of the portraits represent wives of Presidents, including the portrait of Mrs. Roosevelt. The portrait of Mrs. Polk was "Presented by the Women of Tennesee," as these words on the frame state. The full length portrait of Mrs. Hayes was "Presented by the Woman's Christian Temperance Union," and the portrait of Mrs. Benjamin Harrison—also full length—was "Presented by the Daughters of the American Revolution." The portrait of Mrs. Tyler, the second wife of President Tyler, was an individual gift, as also the

portrait of Mrs. Angelica Van Buren, the daughter-in-law of President Van Buren, who was mistress of the White House in his administration.

The six portraits hang in the east entrance hallway, by some people called the "new basement picture gallery," and by the architects who made it, the "East Terrace." The name signifies nothing, the location everything. No more unfavorable location could be found in the White House for these portraits.

The portraits of Mrs. Hayes and Mrs. Harrison afford an interesting study to visitors, because of the strength and sweetness expressed in the faces. When the portrait of Mrs. Hayes was given to the White House the question of where it should be placed caused some discussion. It was well known that the temperance women wished to have it hung in the East Room. At that time the only portraits in the East Room were those of George and Martha Washington. The formal presentation was made in the East Room four days after the inauguration of President Garfield, who accepted the portrait for the White House, Miss Frances E. Willard speaking for the Woman's Christian Temperance Union. President Garfield's promises as to his own course in regard to the total abstinence question in the White House were vague, but his terms of acceptance of the portrait were explicit. In response to the request that the portrait should remain in the East Room he said: "I shall be glad to have this picture on these walls." The frame was of elaborately carved wood, by the women of the Cincinnati School of Design. Tho beautiful in itself, it did not suit the picture, and President Arthur had the change made to the present handsome gilt frame. The portrait of Mrs. Harrison is in a similar frame, this idea being carried out by the Daughters of the American Revolution, when it was found that the two portraits were almost the same size.

The evolution of fashion is partly responsible for general admiration bestowed on these half dozen portraits—visitors often saying of Mrs. Polk: "That is the prize picture." Perhaps it is the sweeping folds of the crimson velvet gown, low cut bodice and short sleeves revealing beautiful neck and arms, or poise of the head, with dark side curls and drooping feathers at the back—altogether a certain stately grace that wins admiration for Mrs. Polk.

Mrs. Van Buren's style of dress antedates Mrs. Polk by fifteen years, in the more quaint fashion of the white brocade gown, elaborate head feathers and band of pearls with pendant on the forehead. Mrs. Tyler's youthful, smiling face is that of a beautiful woman who would be remembered with little thought of the simply fashioned lemon tinted gown.

Chartran's portrait of Mrs. Roosevelt is an attractive picture, exquisitely artistic. Like the other portraits in this basement hall, it shows to great disadvantage in the bad light.

The full length portrait of Martha Washington, the wife of the first President, but, as stated, never mistress of the White House, hangs in the Red Parlor, where the portrait of President Washington is placed. The head of the Martha Washington portrait is a copy by Andrews of the Stuart bust portrait, painted in 1796, and for many years in the Museum of Fine Arts, in Boston.

A portrait of Mrs. Madison, painted a few years ago by Andrews, who made the head a copy of a Stuart portrait of Mrs. Madison, was painted with the expectation that it would be placed in the White House. It was never purchased by Congress, tho it remained on an easel in the East Room several months, then was taken to the Corcoran Art Gallery. Not long ago the portrait was removed to the Cosmos Club, which owns and occupies the "Dolly Madison" house in La Fayette Square, where it was placed for safe keeping when the artist went abroad.

Beside the Stuart portrait of Mrs. John Adams, painted in 1804, a portrait in her early married life, painted by Robert Blythe, in London, while Mr. Adams was Minister to England, represents her as a young, dark eyed, beautiful woman. As the first mistress of the White House, Mrs. Adams had opportunity to display her remarkable executive ability and tact to get the unfinished mansion ready for the first levee, on New Year's Day, 1801. The sparse furniture was so deftly arranged that none but the initiated knew of the planning and anxious hours spent

Mrs. Polk
Mrs. Julia G. Tyler
Mrs. Fillmore
Mrs. Letitia C. Tyler
Mrs. Van Buren
Mrs. L. C. Adams

over the affair. Abigail Adams was equal to every position to which she was called, whether as representative of the first "Republican Court" before King George the Third and Queen Charlotte, or presiding over the White House. It is said of her that she "went on from the day of her marriage to the day of her death, with well balanced judgment and cheerfulness of soul, brightening her husband's pathway."

No woman associated with the White House had so full experience as Dorothy Madison. She had frequently presided as hostess for President Jefferson through the eight years when Mr. Madison was his Secretary of State. Mrs. Madison was quite at home, therefore, when Mr. Madison succeeded President Jefferson, and she went into the White House in her own right as the President's wife, and reigned supreme another eight years. Mrs. Madison's heroism during the advance of the British into Washington was one of her greatest triumphs. Not the least was the saving of the portrait of President Washington when the British burned that White House, about which wildly improbable stories are told.

It would seem that Mrs. Madison herself should be authority on the manner of saving the portrait of President Washington. Her letters are accessible, and the following extract from a letter to her sister gives the story of the portrait, and also a pretty good proof that the second mistress of the White House never for a moment lost her head.

The letter is dated, "Tuesday, August 23d, 1814," and written in the excitement of preparations for flight. In a last paragraph, added Wednesday morning, Mrs. Madison writes:

> "Our friend, Mr. Carroll, has come to hasten my departure, and is in very bad humor with me because I insist on waiting until the large picture of General Washington is secured, and it requires to be unscrewed from the wall. This process was found too tedious for these precarious moments. I have ordered the frame to be broken, and the canvas taken out; it is done, and the precious portrait placed in the hands of two gentlemen of New York for safe keeping."

Not only did Mrs. Madison save the precious portrait, but also the Cabinet papers and the silver belonging to the White House, tho everything of her own was sacrificed.

A few years after Benjamin West painted Mrs. Monroe's portrait another portrait of her was painted by Sené, in Paris, when Mr. Monroe was Minister to France. The French portrait represents Mrs. Monroe with a mass of dark curls about the head, and Greek style of dress severely classic. Mrs. Monroe was the first mistress in the rebuilt White House, with its new French furniture and service of silver plate. Her residence abroad in the Diplomatic Circle at Paris, and later at London, had made her the more punctilious in etiquette, and her entertainments were marked by a quiet splendor quite in keeping with her charming dignity of manner. It was at this time that the "first call" question came to the fore to disturb the peace of administrations, more or less, ever since. Mrs. Madison had made calls and returned calls, to her sorrow, but was unable to recede after beginning. Mrs. Monroe, however, drew the line. John Quincy Adams, then Secretary of State, recording in his diary the pros and cons, said: "Mrs. Monroe neither pays, nor returns visits." The question was made the subject of a special Cabinet meeting, as it has been of Cabinet meetings of later times.

Stuart's portrait of Louisa Catherine Adams was painted at the time he painted the portrait of her husband, President John Quincy Adams. Like Mrs. Monroe, Mrs. John Quincy Adams had been a member of the Diplomatic Circle, familiar with the etiquette of foreign courts, Mr. Adams having been American Minister at Berlin, and later at St. Petersburg. John Quincy Adams was undoubtedly the most learned man who had yet occupied the position of President. Mrs. Adams's elegant and intellectual *régime* was felt throughout the length and breadth of the land.

Another mistress of the White House of marked intellectual tastes was Abigail Fillmore, wife of President Fillmore. It was Mrs. Fillmore who made the library in the White House, securing an appropriation from Congress for the purchase of books, placed by her own hands in the oval room, which has been known from that day to this, as the White House Library.

One of the fine characters among President's wives was Eliza Johnson, the wife of President Johnson. A woman of great refinement and noble aspiration above the humble rugged environment of her mountain home in Tennessee, Mrs. Johnson taught her husband the first rudiments of his education. It is a glory to her memory and a credit to the man whose incentive from a devoted wife led him on, step by step, until he had left the tailor's bench for the floor of the United States Senate, and from that was elected to the office of Vice-President.

Mrs. Johnson was too much of an invalid while in the White House to be before the people and the duties of hostess were shared by her daughters, Mrs. Patterson and Mrs. Stover—gentlewomen, kindly and gracious. The honor and dignity of the nation lost nothing in the hands of these "plain people" of Tennessee. They fully understood what was required of the President of the United States, and were equal to any emergency.

The wives of Presidents have been women of strong character and marvelous adaptability. Men who have become Presidents have owed much in early married life to wives who were helpmates in the true meaning of the word. In the White House their good sense, tact and grace have added greatly to the welfare of administrations. Nobody will dispute the fact that Abigail Adams, the first mistress of the White House, Dorothy Madison, Elizabeth Monroe and Mrs. John Quincy Adams left an impress for good on their day and generation. Devoted in home life, accomplished as hostesses in all that pertains to a gracious hospitality, they were none the less conversant with affairs of state. The same may be said of wives of later Presidents. All, living up to high ideals, filled well the position of "First Lady of the Land." There are also other women, relatives of Presidents without wives, who filled the position with honor and credit. A notable exception among women not wives of Presidents was Miss Harriet Lane, the niece of President Buchanan, and the accomplished mistress of the White House during his administration. It was generally conceded that never since the days of Mrs. John Quincy Adams had the White House been presided over with more grace and dignity than when Harriet Lane dispensed its hospitality.

But at least there should be the complete collection of portraits of wives of Presidents who were associated with administrations as mistresses of the White

House. The Daughters of the American Revolution — that great organization which annually proclaims itself the conserver of patriotic memories—could do nothing more appropriate, or more appreciated by the American people, than the work of securing such a collection for the White House.

WASHINGTON, D. C.

The Third Day

BY ZITELLA COCKE

"MOTHER, dost see the dayspring break.
The rose of dawn bursting to bloom
O'er their dim path who for love's sake,
Bear spices unto Joseph's tomb?"

"My son, a dawn shall bloom to-day,
Which shines the sad world's grief away."

"Nay, Mother, hath the sun forgot
How he in wrath his face did hide,
As he from mortal eye would blot
The Cross on which my Master died?"

"A sun, never to set shall rise,
And fill the earth with glad surprise."

"I seek His grave—fain would I stay,
Can I His loved disciple see
That naked Cross upon the way,
Nor faint this coward heart of me?"

"That Cross, so fearsome now to thee
Henceforth the world's dear hopes shall be—"

* * * * * * *

"Hail, Mother of my risen Lord?
Aye risen, indeed, to human sight.
Fulfilling all His precious word,
Till Doubt and Fear are shamed to flight—
Joy! joy! this heart thrills to its core,
The Master's face again to see,
He lives! He lives! and goes before
His faithful flock to Galilee.
Wish is outrun, Hope is o'ersped,
Jesus is risen from the dead!"

"Ere my sweet Babe to manhood grew,
The sword which yet should pierce me through
The Powers of Hell He should subdue.
Yea, all my son, I knew, I knew!"

BOSTON, MASS.

Herbert Spencer's Sociology

BY LESTER F. WARD

[Professor Ward's sociology differs fundamentally from that of Spencer. From the time of his first work on the subject, "Dynamic Sociology" (1883), to his latest, "Pure Sociology" (1903), he has vigorously combated the biological and in a sense fatalistic conception of the Spencerian school. In the emphasis which the Spencerians have put upon the purely biological factors of human evolution they have slighted or minimized the factors of intelligence. To such extremes has this view been carried that social regulation has been denounced as an interference with evolution—as tho an alien force could be intruded into the cosmic process. It has been the work of Professor Ward to keep constantly before the world the truth that human intelligence, far from adapting itself to its environment, radically alters that environment, and that consciousness and will are as truly a part of the evolutionary process as are chemical reaction and gravitation.—EDITOR.]

C'est le privilège du vrai génie, et surtout du génie qui ouvre une carrière, de faire impunément de grandes fautes.—*Voltaire.*

"NIHIL de mortuis nisi bonum." In these days, when science mourns, no one covets the task of pointing out defects. If Herbert Spencer did not create sociology, he at least raised it into life and started it on its grand career. It required courage to do this and to embody it in a great scientific system on an equal footing with biology, psychology and ethics at a time when others passed it by and disdained to speak its name. This brave act will always be regarded as more than atoning for any shortcomings that the most critical will ever find in Herbert Spencer's sociology. As one of those who have freely critcised that part of his vast scheme during his lifetime, the present writer feels it incumbent frankly to avow that nothing he could say in disparagement of certain aspects of Spencer's treatment of the subject appreciably diminishes the debt of gratitude which he, in common with all lovers of truth, acknowledges to Herbert Spencer for the three monumental volumes in which he has unfolded that science.

But the saying is too trite to need repeating that there is always danger of resting any case upon authority, however great, and that the only condition to progress in any science or in any field of inquiry is fearless and independent scrutiny of the basic doctrines of even the greatest masters. It is, therefore, no derogation from the magnitude of Spencer's achievement to say that, like all things human, it has its defects. In the present case it is perhaps better to say that it has one defect, for by the side of this one all the others are dwarfed into insignificance. And but for the weighty and vital character of this defect it would be unworthy of any one at a time like the present to point it out, and thus break the even flow of just and sincere praise for one who has made an epoch and has now laid down his pen.

How shall we formulate this one salient deficiency in Herbert Spencer's sociology? It may sound too dramatic to say that it consists in ignoring the human mind as a factor in sociology. True, his system embraces two volumes on psychology. Nevertheless I make bold to affirm not only that he did not base his sociology upon his psychology, but that his psychology is of a kind such that sociology could not be based upon it. Written before the biology and transferred to a position between that and the sociology, where, of course, it should stand, it is, nevertheless, as completely isolated as if it formed no part of the Synthetic Philosophy. The sociology, great as are its intrinsic merits, does not represent a science like other sciences, upon which man can lay hold and use as an instrument for his own advancement. Every other science rests upon a body of uniform laws which have been discovered by investigation, and which, as soon and as fast as discovered, can be put to immediate use in furthering the interests of life and ameliorating the condition of mankind. The science

of sociology as taught by Spencer is a complete exception in this respect. Its laws are not pointed out, and there is not only no intimation that if there are social laws they may be utilized to human advantage, but there is a distinct implication, repeatedly expressed, that no such use can be made of them.

In Spencer's psychology spare allusion is made to the most fundamental and essential of the intellectual faculties, the faculty of invention. This is the faculty that has the chief value in sociology. It is the one that has produced nearly all the effects that distinguish man from an animal. But for it he could never have migrated and peopled the earth. It is the basis of all the arts. It underlies all discovery in science. It has accomplished the whole of what is called material civilization. It has done this by applying the known laws of nature to the uses of man. The various sciences, one after another, as fast as established by the discovery of their laws, have thus been put to practical service. There is no law of nature which cannot be made available for such purposes to a greater or less extent. It is the essence of a science that it shall explain certain invariable laws governing the phenomena with which it deals. All true sciences are of that character. If sociology is really a science it must also possess this character. And as man has been able to make practical use of every other science, it must follow that when social laws are really known and a social science is established he will be able to make a practical use of it. This in Spencer's sociology is at least impliedly denied, and in his other works it is expressly and vehemently denied.

To every science there corresponds an art. If there is a social science there must be a social art. That there is such an art no one can doubt, but thus far, it must be frankly confessed, it has remained chiefly an empirical art. In this respect it does not differ from all other arts. All have their empirical stage before they reach their scientific stage. But the empirical arts have all been useful, and the social art, even in its empirical stage, has been the most useful of all, since it has been the condition to the development of all the other arts—nay, to the very existence of society itself. But just as the usefulness of all other arts has been enormously increased by scientific discovery, so the usefulness of the social art will be increased, and in quite as great proportion, by the discovery and application of the laws and principles underlying social phenomena. It is not necessary to point out what all this is to consist in. I have attempted this on numerous occasions and gone as far as possible with the light we possess. But the essential thing is to recognize social phenomena as a field for scientific discovery and for the exercise of the inventive faculty precisely as in other departments of science and art. This class of scientific research once recognized and entered upon, the possible directions that it shall take, the methods and the technic will soon reveal themselves. If there are social laws and social forces, work in the social field will differ from that in other fields only in the nature of these laws and forces. Just as invention in the physical world consists in directing physical forces into channels of human advantage, so invention in the social world must consist in directing the social forces into such channels. The empirical social art seeks to drive men to do what is supposed to be for the interest of society. The inventor never seeks to coerce natural forces. By means of appropriate apparatus devised by his ingenuity he causes or *induces* them spontaneously to flow in the desired channels. It must be so with the social inventor, and social invention, once seriously undertaken, will speedily do away with all mandatory, prohibitory and penal legislation, and inaugurate an era of scientific, or *attractive* legislation, which will make obedience to law the form of action that the individual most desires, thus rendering the operations of society automatic and spontaneous.

Of all this we find absolutely nothing in any of the writings of Herbert Spencer.

There is another point of view from which we may contemplate Herbert Spencer's sociology. In his biology we are taught that organic evolution takes place through the joint action of differentiation and integration. Organic progress is measured by the degree to which organs and structures are multiplied to serve the various ends of higher and higher life,

and by the degree to which these multiplied structures and organs are then subordinated to the directive influence of a more and more perfect nervous system, and ultimately to the absolute control of one supreme directive organ, the perfected brain. It is these two conditions which constitute respectively organic differentiation and organic integration.

Mr. Spencer early espoused the doctrine that human society constitutes an organism analogous in many respects to the organisms of which the world of life is composed. He pointed out these analogies in great numbers and supplied the most convincing arguments for the doctrine that have yet been adduced. But it is noteworthy that he generally, and no doubt intentionally, avoided, as far as possible, those analogies that relate to the nervous system, altho it is here that the most important ones are to be found. He did, however, say that the function of Parliament was analogous to that of the brain of animals, and it is the prevailing view of those who defend the social organism theory that government is the sociological homolog of the brain.

Certain it is that organic integration is effected solely through the nervous system, and, in the higher organisms, through the brain. The various organs and structures would never spontaneously co-operate in the interest of the whole organism and work together in that perfect harmony necessary to carry on the functions of life without an organized nervous system to give and execute the commands of the creature. Mr. Spencer laid great stress on social differentiation, but was almost silent as to social integration. But what is social integration? Evidently it is some co-ordinating system that regulates the manifold organs of society and requires them to work in harmony for the good of the whole. And what can this be but the power, however constituted and by whatever name called, that every society, however undeveloped, possesses, and which is the agent and exponent of the society? Sociologists prefer to speak of collective action, or of the action of society itself, rather than to use the narrower, less correct, and more or less objectionable word government. That term is apt to be taken to mean the particular persons whom society at any given time has selected as its agents to execute its will and conduct its affairs. These persons are nothing but instruments and of no significance from the sociological point of view. The action taken in any case is that of society acting as an integrated unit, in the same sense as the acts of an animal or a man are those of the complete organism under the control of a nervous system presided over by a supreme central ganglion or brain.

Is the analogy, then, to stop with differentiation only? Is the social organism nothing but a complex mass of highly differentiated organs and structures without any co-ordinating and controlling system capable of making them work to some prescribed end and co-operate in carrying on the functions of society? Such is the conclusion to be drawn from Herbert Spencer's sociology.

Mr. Spencer started out in his great career as an avowed and extreme individualist, thoroughly imbued with the doctrines of the economists of his day. Individualism was then and is still taken to mean the opposite of collectivism. But, properly viewed, it is nothing of the kind. It can be successfuly shown that there is nothing contradictory in the two doctrines, and that true individualism is not only consistent with true collectivism, but can, in fact, only be attained by means of it. This may seem paradoxical, but it will seem still more so when I say that the proof of it has been chiefly supplied by Mr. Spencer himself.

In defending the doctrine of the social organism he introduced certain qualifications. He enumerated first the respects in which a society resembles an organism, and, secondly, those in which it differs from one. Altho he reduced these latter to a minimum, and often showed that they were more apparent than real, there remained one which he saw to be fundamental. He said:

"The last and perhaps the most important distinction is that while in the body of an animal only a special tissue is endowed with feeling, in society all the members are endowed with feeling. . . . It is well that the lives of all parts of an animal should be merged in the life of the whole, because the whole has a corporate consciousness capable of happiness or misery. But it is not so with a society, since its living units do not and cannot lose individ-

ual consciousness, and since the community, as a whole, has no corporate consciousness. And this is the everlasting reason why the welfare of citizens cannot rightly be sacrificed to some supposed benefit of the state, but why, on the other hand, the state is to be maintained for the benefit of citizens. The corporate life must here be subservient to the lives of the parts, instead of the lives of the parts being subservient to the corporate life."

Thus we see that it was upon this one important respect in which society differs from an organism that Mr. Spencer justified his individualism and maintained that his attitude of hostility to collective action was in harmony with his general scheme of philosophy. In this he was certainly mistaken, and, what is more, it is this undeniable fact that the individual alone is capable of enjoyment and suffering that constitutes the chief argument for striving to attain the maximum social integration.

According to the Lamarckian law, which Mr. Spencer fully accepted, it is function that creates organs. Whatever organs, structures or parts an organism acquires, they have all been developed in response to a demand growing out of the needs of the organism. The consequence is that all development, whether organic or social, always is and must necessarily be in the direction of some specific advantage to be derived therefrom. And, conversely, whatever is demanded as such an advantage will ultimately be supplied by the development of the structure, organ, or part that is adapted to secure it. Now, as he says, it was manifestly to the advantage of the organism that the manifold parts should come under the complete dominion of the whole organism. Any individual liberty on the part of the various organs and structures would quickly entail the destruction of the organism with all its parts. And all because it is the organism that is sensitive and conscious, while the parts may be regarded as, relatively at least, insensible and unconscious.

All this is reversed in a society, and for the very reason that Mr. Spencer gives—viz., that here it is the parts that are sensitive and conscious, while the society as such is unconscious and incapable of either enjoyment or suffering. This it is that explains the difference between social integration and organic integration. The former, according to the Lamarckian law, is directed exclusively toward securing the interests of the parts—*i.e.*, of individuals. It is, and must necessarily be, introduced for this purpose. Nothing can originate, either in the organic or the superorganic world, which is not advantageous. To conceive of the origin of a disadvantageous organ, or structure, or institution, is to misunderstand the first principle of evolution. The end is the cause of the means, which arises solely for the sake of the end. The end is always the *good* of something. The idea of a good involves that of the capacity to feel. In a word, it implies a sentient being. An organism is such a being, but a cell or a gland is not. An individual man is such a being, but a state or a society is not. It follows that organic development must be in the direction of securing the interest of the organism and not of its parts, while social development must be in the direction of securing the interest of the individual and not of society as such. The general means employed in both cases has been integration, but organic and social integration are unlike in this respect.

Just as in the organic world structures have been the means employed in securing the end—the good of the organism—so in the superorganic world society has been the means employed in securing the end—the good of the individual. This social integration, which is the scientific expression for collectivism, is the only means by which the freedom and happiness of the individual can be secured. Primarily it was the only means by which the human race could protect itself from hostile influences and continue to exist. And now, as always, it is the only means of protecting individuals from the egoistic domination of other individuals. Without a co-ordinating and restraining power to regulate the conduct of individuals toward one another and prevent the wholesale exploitation of the weak by the strong, liberty and happiness would be impossible. The highest aim of true individualism is the maximum individual liberty. Social integration somewhat restricts the individual's freedom, but this restriction is as nothing compared to that which other individuals

would cause in its absence. Even Mr. Spencer's "equal freedom" can only be attained through such collective restraint as shall forbid one individual to interfere with the liberty of another. Within these limits the more complete the social integration the greater the real and legitimate liberty of every individual.

The existing "social unrest," of which we are hearing so much, is due in the main to the imperfect state of social integration at which the world has arrived, and its sole remedy must be through more and more complete integration. The present social movement is wholly in this direction. Mr. Spencer saw the movement, but he misinterpreted it. He saw in it "the coming slavery," instead of the coming liberation of mankind. He imagined that it was morbid, abnormal and temporary, whereas it is perfectly healthy, normal, and destined to continue. He did not perceive that the fundamental distinction which he so clearly pointed out between the animal and the social organism necessarily reverses the direction of social evolution and causes it to work for the good of the individual.

The movement toward collectivism, which no one with his eyes open can fail to see taking place in spite of all that the philosophers may say, is really a true social evolution, proceeding on natural principles, and aiming at the same end as all other forms of social progress—the good of mankind. It differs from organic evolution only in the fact that it seeks the good of the parts instead of the whole, of individuals instead of society considered as something to be benefited. If Mr. Spencer had seen this he might have made his sociology not only symmetrical in itself but harmonious with his entire scheme of philosophy, of which it would have become the natural culmination and the true crown.

WASHINGTON, D. C.

Literature

Two Books on American Sculpture

In these two books,* written almost at the same time, we are supplied by means of two entirely different methods with much interesting information regarding the sculptors America has produced. In Mr. Taft's book we get chronological treatment, from the earliest efforts, in their setting of time and place, and in Mr. Caffin's collection of critiques we get only geniuses of the present day, with rather a feeling of isolation about them, each one being placed upon a high pedestal alone, and admired by Mr. Caffin to the point of extravagance at times.

Mr. Taft is excellent in all the first two parts of his book, which revive almost romantically the men who did the statues we now shudder at, from 1750—when sculpture in this country was represented by the war portraits by Mrs. Wright, whose work in England called forth the title of "Promethean Modeler," and whose wax effigy of Lord Chatham stood for years in a glass case in Westminister Abbey—to the time, memorable in all the American art world, of the Centennial. Showing us the reasons for the absolute lack of sculptural tradition among the Dutch, Quaker and Puritanic beginnings of American civilization, Mr. Taft points out that those crude and, to us, inane or

Palmer. Peace in Bondage. From Taft's History of American Sculpture. Macmillan Co.

* The History of American Sculpture. *By Lorado Taft.* New York: The Macmillan Co., 1903. 118 illustrations. $6.00.

unpleasant productions of Greenough and Crawford and others of the period before 1850 were remarkable for their mere existence and development out of our pioneer or Colonial life. This part of the history is delightful reading, written with the fresh interest of new inquiry into a remote subject by a man who very certainly enjoyed his researches. The men studied are such pigmies, in a way, tho they took themselves so seriously, and had much about them that now seems like pose, but which, as Mr. Taft remarks, "was sincerity and even simplicity itself in that age of ponderous elegance." Most of our early men came from humblest circumstances, and struggled unaided by instruction or surroundings to some knowledge of the craftsman's side of sculpture. Until 1876 little else was accomplished. In the middle period many went to Italy, and there produced "nothing that might not have been done in the same spirit by sculptors of any other nationality then living in Italy." It is much more entertaining and even inspiring to read about the dreams and struggles of these early sculptors than it is to see their works, tho Mr. Taft resurrects for us certain old forgotten things like the "Nymph of the Schuylkill," by Wiliam Rush, that seems to have some beauty, at least in the photograph.

Throughout the book we are made to realize how much the physical mastery of the craft is dependent upon mental fineness, tho in regard to the Sculptor Palmer, who died very recently, in whom Mr. Taft interests us anew, he explains how his early career as a carpenter and then as a cameo-cutter led his mind through channels that were all in the direction of his late work, and so, with his natural sense of form,

> "he was far better prepared for achievement than is the most gifted of college graduates, who may, indeed, be full of knowledge and enamored of beauty, but whose hands are unresponsive."

Palmer, and Ball who is still living, saw the actual beginnings of sculpture in America worthy of the name, and modern American sculpture, according to Mr. Taft, is much more directly descended through their line—to which also belonged H. K. Brown and John Rogers with their sturdy native traits—than by way of the classicists Hiram Powers, Rinehart, Story, Harriet Hosmer, and others. But there entered the influence of Paris for the new generation, and it is now visible in nearly all our work, tho only on the technical side; our art is not now so French as it was once Italian.

Mr. Taft is a little less satisfactory when he writes of his contemporaries. Naturally he is here less free than in earlier parts of the book, and less inclined to place them individually in their relations to the whole field of art, yet he is sane and conservative enough, so that his work will hardly sound as extravagant to a reader of fifty years hence as the "Book of the Artists," by Tuckerman, of 1867, for instance, which he quotes so entertainingly.

Mr. Taft makes the curious mistake of placing Oscar Lenz and Gutzon Borglum among the foreigners working here. Both are Americans.

Mr. Caffin is rather more of the temperament of Mr. Tuckerman. The difference between his book and Mr. Taft's besides the difference in form lies in the innate contrast between the sculptor and the layman thinking about sculpture. Mr. Caffin belongs to the appreciative part of the public. He has all the stock terms that may be acquired in the course of careful, concentrated thinking about one's impressions in art under the influence of studio talk, but somehow he reduces them to cant. His is not a book for the profession, but there are some excellent pages of presentation of facts, a knowledge of which more widely spread will certainly help on that art appreciation which this country so sorely needs.

Bog-Trotting for Orchids

THE bog-trotter comes into his own by the advent of this work. Not only the poetry of the occupation or recreation, whatever you wish to term it, is described, but the practical side as well. We must confess to having penetrated mysterious bog country for orchids and other wild flowers when springtime spread her arms and found fullness of delight in the gloom and silence. The majority of botanists steer clear of the

* BOG-TROTTING FOR ORCHIDS. *By Grace Greylock Niles.* With 72 illustrations. G. P. Putnam's Sons, New York.

bog. To them it is muddy, lonely, dirty and generally without beauty. Perhaps it is so on the borderland, but all bogs have glorious hidden glens and nooks where ferns and mounds of moss shut in colonies of orchids, lilies, trilliums, violets and the choicest of blooms.

The author in three seasons explored the orchid bogs of four States, New York, New Jersey, Vermont and Connecticut. Her investigations covered special trips to the Hoosac Tunnel country, the swamps of Etchowog, Pownal Center, Notch Brook, North Adams, Rocky Hollow, Westville, Mount Carmel, the hill country of Mosholu and Lowere, Mayunsook Valley, the Orange Mountains and Jersey salt meadows. The labors of other seasons, covering a period of years, are brought into the text as a pleasant reminiscence, her special study of the orchid family covering both north temperate and tropical climes. In a plea for the preservation of the orchids of New England stress is laid upon the ignorance displayed by persons knowing naught of the family. The orchid is supposed to grow only in the tropics, and when brought North must be artificially cultivated. As a matter of record, there are from twenty-seven to thirty genera and from one hundred and fifty to one hundred and sixty species found in North America and North of Mexico, and there are eleven epiphytes that belong to the Southern States. Northern orchids grow wherever there is sunshine and moisture. Four species of cypripedium thrive between latitudes 54° and 64°. Alaska has from fifteen to eighteen picturesque kinds. The northeastern part of the United States and Canada raise seventy-one species. Of these from forty-eight to fifty-six grow in New England, and nearly all of them in the

Photograph of an Orchid (Cypripedium reginae), from the Bogs of Etchowog. From "Bog-Trotting for Orchids." G. P. Putnam's Sons

Hoosac Valley, its peat and marl beds seeming to be natural breeding grounds, where Northern and Southern species as well as Eastern and Western meet and intermix. The cypripedium or moccasin flower division has some thirteen species in North American. In the cypripedium the stigma is not a gummy surface, but is in a cavity between the anther cells.

Spirited accounts are given of the finding of all sorts of orchid treasures; the early coral root with madder buds and creamy lip; giant twayblade with showy leaves and queer sepals; green adder's mouth with whitish-emerald flowers; marsh orchis or ladies' tresses; rattlesnake plantain; sweet-perfumed arethusa; raspberry-scented pogonia; grass pink; showy orchids with dainty nectar spur; the lance-leafed green orchids; the yellow-spotted Hooker; the round-leaved, crested, ragged, fringed, purple-fringed; white, yellow and stemless lady slippers.

During May of the first season the bog-trotter found the dwarf yellow lady slipper and the moccasin flowers in the dense gloom of Etchowog, surrounded by colonies of painted trilliums, stars of Bethlehem, Indian poke, dwarf cornel, dog-tooth lily, lily of the valley, Solomon's seal and Indian cucumber. After the find followed an exploration of a tamarack swamp. During the last of June in the vicinity she was almost lost in a hailstorm. Students flocked to the Pownal bogs at this time, and with baskets carried off the season's output of showy lady slippers and pink moccasin flowers, not realizing that such vandalism was bound to bring about extinction.

About the first of July trips to Witch Hollow and Pownal resulted in finding a family of ram's heads growing near chestnut trees; the smaller round-leaved and the great-leaved orchis on a southern hillside. In August and September groups of yellow fringes put in an appearance. The second season was even more fruitful. In the third the swamps of Mosholu and Lowere, New York, the Orange Mountains and salt meadows of Jersey and the Mayunsook Valley, North Berkshire, brought a fine yield. In referring to cultivation the bog-trotter says she has transplanted all the New England species of cypripedium, but only two took comfortably to the garden for a number of seasons. The small and large yellow kinds were easily managed in separate plants. The showy lady slippers and pink moccasin flowers proved difficult to raise.

The author has a sympathetic style relieved with cheerful whimsicality. Of the fifteen genera of Orchidaceæ of New England all save Listera, Tipularia and Aplectrum are represented in the illustrations. The photographs were made by the author and Miss Katherine Lewers.

Books for the Quiet Hour

It is a far cry from the Puritan ancestor who read nothing but sermons to his great grandson who reads nothing but the daily newspaper. We see the latter everywhere, on the trolley-car, the "L" train and the ferry. It would seem that he never had a quiet hour, or a thought beyond the limited area cirmumscribed by the head-lines of his paper. Yet it is pleasant to think that even in his hurried life he may find time in which to read and enjoy a book* like Dr. Hepworth's "Fourth Series of Herald Sermons," which reached a wide audience every Sunday morning for years through the editorial page of the *Herald*. Their mission is not yet ended, and we are glad to see them in more permanent form.

Another collection of popular essays† on a theme of more than passing interest comes from the pen of William Chester, a graduate of Princeton, and for nine years a student in Paris under August Sabatier. His book bears the marks of careful study and preparation. Mr. Chester would be the first, no doubt, gratefully to acknowledge his indebtedness to Fiske and Drummond, Kant and Descartes, Martineau and Wallace, and yet his book is his own, clear in thought as it is in diction, and far from commonplace in either. We note a fault in speaking of "the larger hope," that,

"while the power of resistance of the human will to God is vast and indefinite, yet the power of love is infinitely greater, and in the long run

* Making the Most of Life. *By George H. Hepworth.* New York: E. P. Dutton & Co. $1.00.

† Immortality a Rational Faith. *By William Chester.* New York: Fleming H. Revell Company. $1.00.

of ages the Divine Father will, in His wise way and time, subjugate all things to himself,"

the author says: "*This is not Universalism;* for Universalism declares that this is true, while we hope that this may be true." The passage seems to us a mere quibble, unworthy of the honesty of the rest of the book.

The history of "Religious Liberty"* is the history of the noblest struggle of the human mind, ranking next to that never-ending fight for freedom of person and thought which has made much of the tragedy of the loftiest spirits in every age. That men have been willing to suffer persecution, either brutal or subtle in its character, or even to die, for the truth as they saw it, is one of the most transcendent things we know of the nature of man. The present volume treats of this phase of the history of the Baptist Church, from its obscure beginnings in 1500 in Holland and Switzerland to Roger Williams, Thomas Jefferson and James Madison, all advocates of perfect religious liberty. It is a careful, historical monograph, written from the Baptist standpoint.

Dr. Stall takes for the text of his new book† the quaint words of George Herbert:

"By all means use sometimes to be alone;
Salute thyself, see what thy soul doth wear."

And in the brief essays and paragraphs he has written for the "hour of quiet communion with self and Christ" there is much shrewd and sensible advice, as well as purely devotional passages full of real feeling. For example, this:

"Deal thoughtfully with the young, for they have a long journey before them; and be tender and considerate with the aged, for they have come a long way."

"Our gifts are measured, not by what we give, but by what we have received."

One Religion: Many Creeds,‡ might have been entitled "The New Protestantism" when it was first printed thirty years ago. At the present day its bold assertions do not appear so startling as in 1870. Few thinkers even in what are called the "orthodox sects" of Christians, are at all startled by the word "myth" or "legend" when applied to the stories of the Creation, the Deluge, or the Garden of Eden. More and more are the Churches sifting the divine gold from the human dross, which is the accretion of ages of ignorance and credulity. No doubt we still believe things our grandchildren will discredit; but most present-day Christians would cordially concur in Mr. Winans's dictum that "it is better to be on the side of Truth than to have Truth on our side," and grant his critical objections a patient hearing and whatever weight they deserve. As in so many rationalistic writers, there is a painful lack of poetic imagination, and of any comprehension of its products. The "literal interpretation of the Scriptures" is by no means confined to the orthodox believer; it is found quite as often among his critics. Whether the Occidental can ever fully understand the Oriental is a question. That an essentially prosaic mind will ever comprehend the divine exaggerations of the poet is not a question—he simply cannot, any more than a cold, calculating sensualist can understand the tender extravagances of a true lover. A Christian needs imagination, as much as the poet or the creative scientist.

A book that has grown out of real needs such as a city missionary or settlement worker or army chaplain* must meet every day is apt to be intensely practical. Such sermons deserve respect because they have helped men on the "Long March," if for no other reason. Dr. Trumbull's sermons, however, have a value aside from the need that produced them.

There is a growing tendency in the Church to place the emphasis upon the Life rather than upon Belief, however rational the creed may be. This is what the Master would wish us to do. In a little "Study"† on the subject, "Following the Master," the more practical and helpful side of Christianity is discussed. The "Kingdom" we seek is so much within us, and more within our own control than we readily believe or are willing to admit. He that doeth the will shall know the doctrine, and the doing must come first, as it does, practically, in most things. The Law of Love is the solvent for most of our perplexities.

Mediæval England. English Feudal Society from the Norman Conquest to the Middle of the Fourteenth Century. By Mary Bateson. New York: G. P. Putnam's Sons. $1.50.

Slings of Warfare. From "Mediæval England." Putnam's.

To say that this volume belongs to the "Story of Nations" series sufficiently indicates its form and character, altho it differs from most of its predecessors in being more a picture of a state of society than a narrative of events. In recent years medieval history has been a favorite field of research by students, and the economic and social conditions of the period have been worked out with remarkable minuteness and clearness, considering the fragmentary and obscure nature of the material. The results of this patient investigation have not been published to any great extent in popular form, and ordinary readers still get their ideas of the age of chivalry from romances, which, however enjoyable, are not always safe guides to history. The present volume is quite as interesting as the average historical novel and much more reliable.

The Woodhouse Correspondence. By George W. E. Russell and Edith Sichel. New York: Dodd, Mead & Co., $1.50.

If you have any hypochondriacal friend or a disgreeable relative, this is a good book to send him or her as a present—anonymously, of course. If it does not effect a cure, it will at least relieve your mind by giving you an unequaled opportunity of showing how offensive to you is selfishness—in other people. Perhaps, merely to see how well it hits the foible of your friend, you had better read it over before sending it to him. The standard definition of an egotist, one who persists in talking about himself when you want to talk about yourself, applies to all the correspondents in this book, and the letters are all amusingly frank in their betrayal of unconscious but supreme selfishness. From the diary of the literary lady, who is not appreciated even by her relatives, we extract this poetical gem:

Lady Stag-Hunting. From Mr. Yates Thompson's Book of Hours, in "Mediæval England." Putnam's.

"A SONNET TO MYSELF.

"O thou who, tho men flee, art always there,
Thou who canst never leave me till I die:
Where wert thou born, Bud of Eternity?
Who taught thee thus to love and do and dare?
Is it a law that Titan souls must bear
The dreary denseness of the smaller fry?
That thou, who feedest on the higher air,
Canst never, never know the reason why?
Stride on, Myself! Stride onward, anywhere,
So long as thou art moving. Far and nigh
Foes strike: some of thy blood—some even share
Thy roof-tree. Still stride on, with nostrils high,
Human, yet godlike; dusk, yet passing fair;
Mine own, yet not mine own—my Cosmic I!"

The Hour-Glass and Other Plays. Being Volume II of plays for an Irish Theatre. By W. B. Yeats. New York: The Macmillan Co., $1.25.

The leaders of the Neo-Gaelic movement are much more interesting and convincing when they talk about the Irish theater than when they publish the plays for it. We have no way of judging of the adaption of Mr. Yeats's plays to his actors and their auditors, and of their power when presented as they were intended to be, but they are not interesting nor impressive to the ordinary reader. The first and title play of this book is, however, the best that Mr. Yeats has published, and has somewhat the suggestiveness and effect of one of Maeterlinck's. It is a morality play, and its theme is to show how much easier it is to tear down than to build up—to destroy faith than to create it.

Between the Acts. By Henry W. Nevinson. New York: E. P. Dutton & Co., $2.50 net.

A book of short studies of certain phases of life, told in alternate stories and poems. The most pleasing of these sketches is the one treating of the life of the author's grandfather and the patriarchal household gathered about him. "A Don's Day" describes the purposeless man to the life. Power of decision seems to have atrophied in the mind of this unfortunate individual, whose narrow scholastic work and self-centered life have led to an exaggerated sense of the importance of his every action and of his own conspicuousness.

Pebbles

SOME of the Mormon prophets are about to get a "revelation" straight from the American people.—*The Chicago News.*

9.00 P. M.

He: "The room is frightfully warm. Let's go walk in the moonlight?" *She:* "All right.'

9.15 P. M.

He: "This moon is worse than a searchlight. Let's sit in the summer house?" *She:* "All right."—*Cornell Widow.*

...."'07 (*after slapping the wrong man familiarly on the back*): "Oh, pardon me, sir, I thought you were some one else." '04: "You are quite correct. I am."—*Harvard Lampoon.*

...."I must congratulate you on the noble indignation with which you expressed yourself against the Mormons." "Yes," answered Senator Sorghum. "I feel perfectly easy in my conscience about going after the Mormons. They don't represent any big financial interest that are liable to get back at me."—*Washington Star.*

....At a public entertainment recently a conjurer had an experience that was highly comical, tho quite disastrous from a professional point of view. Having produced an egg from a previously empty bag, he announced that he would follow up this trick by bringing from the bag the hen that laid the egg. This little arrangement he had left to his confederate to carry out. He proceeded to draw the bird from the bag, but what was his surprise on finding that the alleged hen was an old rooster, which strutted about the stage with ruffled feathers and offended dignity, and set up as vigorous a crowing as if it had just awakened from its nocturnal slumbers. The whole audience shrieked with laughter, and the unfortunate conjurer made a bolt for the dressing room.—*Tit-Bits.*

THE CAUSE.

He: "I asked your father's consent by telephone." *She:* "What was his answer?" *He:* "He said: 'I don't know who you are, but it's all right."—*Harvard Lampoon,* May 21st, 1900.

FIRST RESULT.

She (lovingly): "But please ask papa, dearest." *He (soothingly):* "Oh, but I have—over the telephone. He said: 'Who are you? but never mind, it's all right!'"—*Life,* February 19th, 1902.

SECOND RESULT.

"Have you asked papa?" "Yes, I telephoned him. He said he didn't know who I was, but it was all right."—*Life,* March 3d, 1904.

WHAT TO EXPECT.

She: "Did father consent?" *He:* "Oh! yes. I sent him a Marconigram, and he said he didn't know who I was, but that it was all right."—*Life,* January 5th, 1906.

—*Harvard Lampoon.*

Editorials

The Bugaboo of Individualism

Not long ago we had something to say about "Morality up to Date." The subject is a large one, not to be exhausted in one short editorial.

Most of the moral issues of this present time turn upon the relations of individuals to society. For twenty-five years we have been witnessing a reaction against the individualistic tendencies that characterized the first three-quarters of the nineteenth century. English liberalism, the revolutionary movement of 1848 on the Continent, and the humanitarian movement in the United States, were all surcharged with a passion for individualistic liberty. This passion found literary expression also in the economic doctrines of the Ricardians, in John Stuart Mill's fearless little book on "Liberty," in Herbert Spencer's "Social Statics" and in the writings of Emerson. The age of the individual seemed at hand. Political restrictions were giving way. Economic freedom had shattered most of the medieval industrial bonds. Scarcely did theological creeds and social conventions remain to trammel the human spirit. Then all at once a curious change came over the business world, and, with it, a great back-draft of collective feeling swept individual life once more under a resistless social control.

No one can compare the conduct and the utterances of men who attained eminence in what may be called the Emersonian age, with the conduct and utterances of men to-day, without discovering how far we moderns have fallen below the standards of perfect fearlessness and simplicity that prevailed in the earlier time. We of to-day are constrained by considerations of expediency, which means by a fear of what our fellow men may do to us if we are frank. As in our industrial activities we are compelled to submit to the dictates of trust directorates, or of trade union majorities, so in private conduct we submit to a fanatical, or to a brutally materialistic, social pressure.

Not only have we lost social and moral liberty at the same time that we have lost economic liberty, but also we apologize for our bonds or shamelessly defend them. We utter the word "individualistic" with much the same infection that we give to the words "improper," "ill considered," "uninformed." We quietly take it for granted that the individualist is a reckless or unbalanced person, who may be a good enough fellow in his peculiar way, but whose "views" should be regarded with judicial suspicion.

The causes of this strangely changed attitude of the English and the American mind have never been adequately set forth in any of those studies of social psychology that the Bryces, the Demolins, the Bourgets and the Aline Gorrens have been offering for our enlightenment. They are not, however, obscure, and it is high time that they were brought under discussion. The Independent may claim to have been the first to call attention to them, and we propose to keep them before the public mind.

The failure of the old individualism was an inevitable consequence of identifying individualism with interests that are not properly individualistic. There are certain great concerns which, by their very nature, are public, or communal, or socialistic—we do not care which word is used. Until these are socialistically defined and administered there can be no true liberty within the sphere of private conduct, and therefore little individualism in a realm that is rightly individualistic.

The world has revolted against individualism because our individualistic laws of property have not fully discriminated, as one day they must discriminate, between the wealth that is created by individual effort and the economic opportunities that are given by nature or created by the State. An almost unrestricted private control of

these latter has enabled unscrupulous men to destroy the economic liberties of their fellows, exactly as an earlier kind of individualism enabled the "enterprising," who understood how to manipulate rotten boroughs, to destroy all true political liberty.

Instead, however, of perceiving that the strong have been able to exploit the weak not because of individualism as such, but because we have confounded the sphere of individualism with that of socialism, the modern world has hastened to conclude that all individualism is unsocial, egoistic and disintegrating; and then—to be as perverse as possible—instead of suppressing individualism where it should be suppressed—in the sphere of communal interests—this same queer modern world has set about suppressing individualism within the sphere of private conduct!

As things now stand, we hedge about private life with inane conventionalities borrowed from old world aristocracies and with paternal legislation, while allowing the economic individualism of the promoter along lines properly communal to grow and to flourish as the green bay tree.

All in all, the most maleficent error of our times is the assumption that individualism and socialism are mutually exclusive. They are correlatives, and upon their due and proper balance the welfare of the world depends. The imperative moral need of to-day is for an enlightened social conscience that shall see the essential wickedness of trying to suppress individualism within the sphere of private conduct, while permitting it to seize upon and to control those natural resources and those economic opportunities that rightfully belong not to individuals, but to society.

Our Treaty with China

We are heartily glad that China has had the moral courage to denounce its treaty with the United States. It will, therefore, expire on December 27th next; if not denounced it would have continued in force for another ten years. It was by pressure put upon China that this treaty was unwillingly accepted by her, inasmuch as it made China a consenting party to our legislation excluding Chinese from this country. It is said that our State Department endeavored to persuade the Chinese Government not to denounce the treaty, impressing upon it the danger that no other treaty could be accepted which would not be even more drastic in its terms, and that the Chinese would even more strictly be excluded from the country.

Nevertheless, we are glad that the Chinese Government refuses any longer to be a party to its own humiliation. The Geary Anti-Chinese law was enacted under the foul influence of the Sand-Lot orators of California, to whom our timid politicians of either party were too ready to listen. Democrats and Republicans approved the exclusion of the Chinese in their national platforms, and the general sentiment of the country, we fear, still approves of it. The selfish spirit which tries to limit as far as possible the number of wage earners, in the foolish belief that this will conduce to prosperity and high wages, has supported the law. For many years we welcomed immigration; now there is a pronounced, if not prevailing, sentiment against admitting new settlers except under the most severe restrictions. Even the persecuted Jews of Russia many people would exclude, weary of making our country a refuge for the oppressed of other lands, and holding that no sympathy should go to waste except on the oppressed native-born victims of our own greedy capitalists.

We do not exclude the Japanese; why should we exclude the Chinese? Why should we pick them out as special objects of disfavor? They are good, faithful workmen; they do needed labor; they are not beggars; they do not fill our almshouses or jails. They give us their labor for a moderate compensation, and go back to China. Those who employ them in our Western orchards and vineyards like them. But they work, and that is the chief reason why they are not wanted. Already we hear suggestions that other races be shut out, and Panama has passed a law, based on ours, which actually excludes Caucasian Syrians.

It is shortsighted politics, but not long-headed diplomacy, to insult a great nation like China. Within twenty years China will very likely prove to be one of the most

powerful nations, if not the most powerful, on the face of the globe. The United States and China will face each other on opposite sides of the ocean. China is a peaceable nation, averse to war, given to trade. The time will come before long when China will be able to retaliate and to protect her own honor. Is it well to persist in a course of treatment of so great a nation which will make her our enemy? But, more important, is it right, is it Christian, for us to persist in insulting the citizens of the oldest and most populous nation in the world? Now China gives us a chance to correct not only a treaty, but our laws. We appeal to the people of the United States to reverse this impolitic and unjust legislation.

Governor and Chairman

WHY has there been no protest from the rank and file of the Republican Party in the State of New York against the avowed intention of Governor Odell to become Chairman of the Republican State Committee? For some time this has been known to be his purpose. It was proclaimed after the conference of Sunday afternoon, the 20th inst., at which were present Senators Platt and Depew, Postmaster Van Cott, Collector Stranahan, Surveyor Clarkson, Assistant Treasurer Hamilton Fish, National Committeeman Sheldon, the present officers of the State Committee and other prominent Republicans. They asked him to take this office, and he consented to do so. The request was made by Senator Depew. "It was agreed," said the brief official report to the public, "that the Governor should be selected as the Chairman of the State Committee to be chosen at the approaching convention in April." To the press Governor Odell expressed his gratification because there was practically a unanimous demand for his services in that office.

No one suggested that he should give up the office which he now holds. No one pointed out the gross impropriety that would be exhibited if he should direct the approaching campaign as chairman of this partisan committee, and retain the office of Governor of the State. It does not seem even to have occurred to these Sunday conferrees that this would be a political blunder. When the Governor was asked by a reporter whether the duties of his present office would not conflict with those of the Chairman he replied that he was not worrying about it. Lieutenant-Governor Higgins remarked that "the duties of the two positions need not conflict." He saw no reason why Mr. Odell should not hold both places.

If the Governor takes this chairmanship he should at the same time resign the office to which the people elected him. The impropriety and political folly of holding both places are so manifest, it seems to us, that they do not call for argument. That the impropriety is not seen by some who ought to see it is evidence of the benumbing influence of boss rule in a State where the petty factional warfare of the last two or three years has not been characterized by devotion to a single elevated principle in politics.

What are some of the duties of the Chairman as they are known to those who are familiar with the work of the head of "the organization" during a campaign in the State of New York? Is it not true that he seeks the support of rich and powerful corporations—their contributions and their influence; that he strives to conciliate and satisfy the railway, gas and other companies doing business upon franchises that are subject to State legislation and taxation; that he solicits, receives and distributes a great fund of money—a fund that has sometimes in past years been used effectively for procuring the election and the control of legislators, the election of Senators, and even the political advancement or financial elevation of the Chairman himself? Is such work in harmony with the duties of a Governor, who is bound in honor and by his oath to serve the interests, not of one political party, but of all the people in a great State?

Mr. Odell may be willing to bare his conscience to the wear and tear to which such a conflict of allegiance would subject it; but we are confident that a large majority of the people are unwilling to see him thus exposed to temptation. At the present time the annual raid of what has been called the "black-horse cavalry" is in progress at Albany. Numerous bills in the interest of great municipal-franchise corporations and clearly to the disadvantage of the people are pending.

Some of these, against which the people of New York City are loudly protesting, already await his action or soon will be laid before him for veto or approval. Classed with them are other similar bills affecting the interests of the entire State—bills granting special privileges of great value, bills that rob towns and cities of home rule, and one bill that would empower a corporation to ruin the great cataract of Niagara for private gain.

There is no corporation interested in these scandalous measures that would decline to solicit the favor of the Governor by a generous contribution to the campaign fund of the committee over which he intends to preside. Of course, the approving signature of Governor Odell to any bad bill could not be obtained in this way. We are confident that the prospective loss of a fat contribution and of powerful support would not restrain him from doing his duty; but a Governor should not by taking, or promising to take, the chairmanship of his party's campaign committee, expose himself to insidious assaults upon his integrity. Nor should he, if he really desires to serve his party effectively, consent so to place himself that attacks of political foes upon his integrity shall be justified to the minds of the thoughtless.

The electoral votes of the greatest of our States may not be indispensable for the election of the Republican Party's Presidential candidate, but they are worth having. History shows that political blunders cost something in New York. A wise political leader in this State will strive to gain the support of those independent voters who have repeatedly turned the scale. Governor Odell and those who asked him, at that Sunday conference, to take the chairmanship ought to know that this proposed combination of a great public office with a distinctly partisan one would be very distasteful to independent voters, who already find much to disapprove in such incidents as the Governor's promotion of Justice Hooker, the bitter and intemperate opposition of some of his friends in the Senate to the bill by means of which Mr. Jerome seeks to convict the notorious gambler Canfield, and a continuous factional controversy in which the average voter hears nothing but the creaking of the machine. Thus to invite and to deserve the hostility of those who hold the balance of power at the polls would be amazing folly.

The Hope of Immortality

It was a hope of old. Plato and Cicero desired the life beyond the grave, but felt no assurance of it. They piled up analogies and dreamed dreams in which their spirits seemed to wander afar from their bodies, as free as their hopes of the future life. They wove flimsy arguments out of false metaphysics, and told us that the uncompounded soul could not suffer dissolution. But after all it was but a hope; they were half aware that they had not convinced themselves by all their reasonings, and the best they could say was that if they were mistaken their unbelieving opponents would never in the future world be able to mock their credulity.

And yet they would not give up their hope. They insisted that it was a belief. The most beautiful, the most inspiring of all the writings of classic antiquity are those which brave the question of life after death, and face the just judgment of Olympus. They are those that insist that virtue has its reward in two worlds; for two worlds there must be, we know not why, but we refuse to believe that there is but this one. The wise nations of the East, outside of Greece and Rome, held the same hope, preached the same morality, supported it with the same sanctions of judgment beyond, and loved to paint on the coffins of their dead the picture of the soul's travels through the portals of darkness, the pitfalls and ravenous beasts of vengeance, to the peaceful resting places where in the calm of eternal felicity the just soul dwells in the endless favor of Osiris, himself an Osiris, a partaker of the nature of the gods.

Who can say how much of this was an unreasonable, as it was an unreasoned and baseless hope, or based on some internal assurance that underlies reason, because it is a part of the essential nature of the soul itself? Even those that, like Spencer, profess themselves Agnostics, who declare that reason can never settle the question of the future life, yet, as they approach the end of this life, look with a longing, easily passing into

hope, that there may be a beyond in which unanswerable questions will receive favorable solution.

To such hopes, in such days of old, came the revelation of Jesus Christ. It offers assurance in place of hope. It tells of the resurrection of him in whom was life, and the life was the light of men. It tells of one who conquered death, and on whose resurrection the Church of Christ was founded. In the faith of the resurrection of such a spiritual, not fleshly body, Christendom rejoices in this week of sympathy with its dying Lord, and triumph in his victory over death.

The Remarriage Question

For a dozen years and more efforts have been making through ecclesiastical action and by the National League for the Protection of the Family, to secure uniform laws throughout the country as to marriage and divorce. Meanwhile the divorce evil grows worse and worse. In a number of our States there is one divorce for every eight or ten marriages. And these divorced persons speedily contract new marriages, so that while we have wives in couples and multiples in Utah we have a vast amount of tandem polygamy spread over all the rest of the country.

These efforts have had little success. The difficulties are greater than were anticipated. The American Bar Association took up this, with other needed reforms, hoping to secure uniform legislation between the States; but unforeseen difficulties arose. While this Association has secured the agreement of 23 States to a uniform law on Negotiable Bills, they have as yet been able to do very little as to uniform laws of marriage and divorce, altho they have not yet given up the attempt.

An amendment to the Constitution is impossible, and so is any other amendment that will transfer authority from the State to the General Government. We may be sure that at least a dozen Southern States will block the way for a generation to any suspected limitation of States Rights. And, further, those who want very strict laws on divorce prefer to have things remain as they are. New York allows divorce for but one cause, while the large majority of the States have much looser laws, supported by public opinion. If Congress were to make laws on marriage, they would surely make divorce easier in this State, and to that Bishop Doane and those who agree with him object. So they would rather indorse the evil of Mormon polygamy than risk the evil of easier divorce and remarriage in New York.

So we are shut up to an attempt after uniform legislation; and for this we must look first to the influence of the Churches, led, it would seem, by the Episcopal denomination, whose prevailing sentiment seems to be in favor of no remarriage after divorce for any cause, or, at least, for but a single cause.

It is with the view of securing first uniform practice in the Churches, and next, uniform legislation, that the conference on divorce, representing a number of leading denominations, was held a few days ago in St. Bartholomew's parish house in this city. The members could not agree on either no divorce, or on divorce for but a single cause, but they did pass the following resolution offered by Bishop Greer:

"That in recognition of the comity which should exist between Christian Churches, it is desirable, and would tend to increase the spirit of Christian unity, for each Church represented in the conference to advise and, if ecclesiastical authority will allow, to enjoin its ministers to refuse to unite in marriage any person or persons whose marriage the ministers have good reason to believe is forbidden by the laws of the Church in which either party seeking to be married holds membership."

This resolution sound fraternal, and is generally approved in its spirit; and yet we question if it does not go too far. It is aimed at the remarriage of divorced persons, and yet it does not mention them directly, but formulates a rule which has a much wider application. Thus the Roman Catholic is one of the "Christian Churches." That Church has a well known law forbidding marriage with non-Catholics. But what Protestant minister would feel himself obliged to help execute that law? Under this resolution no Protestant could be married to a Catholic, except by a Catholic priest, and with a strict promise that the children of the union should all be brought up Catholics. That may be a good law

for the Catholic Church to enforce, but not one for a Protestant Church to enforce.

So it is with other rules. Let us suppose that the Episcopal Church—and it is quite possible—should enact a law that its ministers perform no marriage service for any divorced person, except for the innocent party in a divorce for adultery. Then let us suppose that the Presbyterian Church should enact a law allowing remarriage to such an innocent party, and also for the innocent party in a divorce for desertion, believing that this case is provided for by St. Paul. In such a case, tho supported by the legislation of every State but two in the Union, the Presbyterian minister, believing remarriage after desertion to be right, could not perform the ceremony in such a case if one of the parties were an Episcopalian. That would be an infringement on the liberty of the minister's own conscience, and it would require him to be a party to the enforcement of a rule imposed by a body which had no right of control over him, and a rule which he believed to be unjust and provocative of immorality.

For these reasons we hesitate to approve of the rule proposed. It speaks the language of comity, but no comity is worth while which limits the liberty of conscience. The subject is one of tremendous importance, but we shall have first to thrash out the question before the bar of public opinion as to what are the proper causes, in the interests of family life, for divorce. We are convinced that the law in South Carolina, which allows no divorce at all, or the law of New York, which allows divorce only for adultery, will not command the assent of the Christian conscience generally. At present the first hopeful legislation appears to be in the line of the example set by Delaware, which is intended to prevent migrations for the sake of divorce, and which provides that no divorce shall be granted for any cause arising prior to the residence of the petitioner in the State, unless that were also a ground of divorce in the State where it arose. Further, Congress might well establish a commission to investigate the subject and recommend legislation for the Territories. Such a commission might work in harmony with unpaid State commissions already existing, whose work moves too slowly.

Nietzsche Contra Wagner

THE case of "Nietzsche *contra* Wagner" has become celebrated, not because it deals with a new issue, for the problem dates back at least to the age of the first mammals, but because it presents in such striking antithesis the two extremes of the eternal conflict between self-assertion and self-restriction, between egoism and altruism; a conflict in which we are all combatants drafted for life, and in which there is no truce even for a day.

On the one side we have Wagner, twisting together for the first time into a triple cord, picture, tone and spoken word, and using this to bind his charmed and unsuspecting audiences to the philosophy of Schopenhauer. On the other side, we have Nietzsche, the most daring and uncompromising of those whose temperament dooms them always to be leaders of the opposition. He is inevitably an antipodal philosopher. Like an iron needle in a magnetic field, he becomes magnetized by induction whenever he is brought under some powerful influence, and instantly points in the opposite direction. Objecting to certain phases or manifestations of the Christian religion, he at once proclaims himself Anti-Christ. In early life a fervent admirer and eloquent advocate of Wagner, he becomes his most bitter opponent, and has no difficulty in proving by the proper selection of passages from his former writings, that he had always been his direct antagonist. Whatever cause he champions he uses words that cut and tear and sear, and no man who comes in contact with him is unmarked by them.

Where between these extremists shall the normal man stand? On which side is Christianity, if this is, as we believe it is, the religion of the normal man? Both parties appeal to Christ against Christianity, and arraign the Church in the name of its Founder. Nietzsche says, "In reality there has been only one Christian in the world and he died on the cross." He calls attention to the fact that the Gospel was "good news," increasing the "joy of life," and shows that Jesus so far from being regarded as an ascetic was called "a glutton and a

wine-bibber" by those who looked for another mode of life in a prophet. He cuts the ground from beneath his opponent, Schopenhauer, the Neo-Buddhist, by showing that Buddha also was deserted by some of his uncompromising followers because he refused to fast and mortify the flesh.

As representatives of the opposite idea, that Christianity is primarily a religion of repression, of renunciation, and of self-sacrifice for its own sake, we find not only Wagner, who in the "Nibelung's Ring" expounds from the Eddas the same sad lesson which he in "Parsifal" derived from the New Testament, but also an unbroken line of apostles of asceticism from St. Anthony to Tolstoy. Schopenhauer says ("The World as Will and Idea," III, 447) "Protestantism, since it has eliminated asceticism and its central point, the meritoriousness of celibacy, has already given up the inmost kernel of Christianity." The hermits and fanatics of all ages have been able to find warrant for their extremest practices by the literal interpretation of some of the sayings of Christ, such as hating father and mother, and plucking out the offending eye. Even Klingsor, the magician, has verbal authority, as well as the example of Origen, for the drastic method he adopted to acquire the necessary chastity to become a Knight of the Holy Grail.

To some persons, then, Christianity is a source of joy, to others, of sorrow. Some it arouses, other it depresses. Some it relieves, others it burdens. Some it liberates, others it confines. Both pessimists and optimists claim it as their inspiration. Historically Christianity came in the world first as a disturbing and exciting force. It set people free from their conventional and congenital ideas of right and wrong. As Nietzsche says of his own philosophy, it forced "a transvaluation of all values." People did not fully understand what Christianity means in those early days. No one yet fully understands what it means. Some there were who, freed from a sense of sin, gave themselves up to all sorts of licentiousness and debauchery. Some there were who, oppressed with a sense of sin, buried themselves in caves in the desert. The Epicurean sects speedily burned themselves out, for vice is self-consuming and expires except when continually supplied with new fuel from the virtuous. The monastic sects, based upon a principle less immediately destructive—for human nature endures better restriction than riot—have never become extinct, but have persisted and very strongly influenced the current of Christianity.

Both parties to the controversy misinterpret Christ and his Church. Nietzsche is wrong in saying that Christianity is merely "a religion of slaves." It is also a religion of the leaders of men. Militant Christianity is not in all cases a perversion of the true doctrine. Christianity has its heroes which it cannot disown. Of the past nineteen hundred years many of the greatest men, the strongest, those who have accomplished most, have changed history by the power of their own personality, have been Christians.

Schopenhauer is wrong in saying that celibacy is the chief Christian virtue. Celibacy in itself is neither Christian nor a virtue. Christian ethics condemns even the suicide of an individual. How much more then the suicide of a race.

Western Farmers' Self-Help

Two years ago we called attention to the beginning of a co-operative movement among Western farmers, particularly those of the wheat belt. They had grown weary of the oppression of elevator owners and sought some method of getting their grain to market with the least possible expense. Grange movements in the past had been only partly satisfactory; the Farmers' Alliance had drifted into a political organization solely, and the real producers remained at the mercy of giant corporations owning the elevators to which every farmer must haul his grain. It will be remembered that the provision which proved the salvation of the new movement in co-operation was one allowing the members of the association to sell where they saw fit, but compelling those who sold elsewhere than at the company elevator to pay to the association one cent a bushel on all grain so disposed of. The result was the discomfiture of rivals, as paying higher prices than the market

allowed simply filled the farmers' treasury and increased the dividends.

It is interesting to note the growth of this new movement. The past three years have been marked by large wheat crops and the associations of farmers have increased rapidly in number. Developing the individual association into a union of many, they have formed large series of such companies, working in harmony for the disposition of the grain to the best advantage. The Western farmer can often secure a better price by selling to local mills than by shipping across the country, and this has aided in the development of the idea. One of these larger organizations now has 60 elevators in operation and over 3,900 members, nearly all of whom are farmers. At the annual meeting held recently a dividend of 8 per cent. was declared and 22 per cent. more in profits was returned to the members. This is making a success without question, and it is little wonder that the number of such organizations is extending through Oklahoma, Kansas, Nebraska, Minnesota and Iowa, where the agricultural communities are most dependent on grain production.

The advantage of the union of the small associations into the larger companies is that there can be secured high-priced superintendents, overseers and salesmen, while the expense is divided into small parts through the large number of members. No member is allowed to hold more than 20 shares, so that frequently 200 to 300 farmers in a given community are part owners in the shipping facilities. Under these conditions the co-operative elevator monopolizes the business.

The railroads were at first antagonistic to the plan and sought to hinder the shipping of grain through delay in furnishing cars, etc. But the farmers have found a way to reach the tracks, either through invoking the assistance of the courts or appealing to the business interests of the railway managers. The West is so thickly strewn with roads that it is seldom more than a score of miles to some competing system. The sight of fifty or a hundred farmers in line bound for the station of a rival road has been enough to stop all further annoyance on the part of the road nearest to the community. The boards of trade in Western cities likewise fought the farmer members, but they soon discovered that an organization of 4,000 members that could call for information about growing crops, could shut off the selling or hurry grain to market, that employed capable men and utilized modern machinery, was worth reckoning with, and they have taken them into business fellowship.

At present the co-operative grain-selling idea is growing very rapidly in the Middle West. There are nearly 400 of the individual companies or associations already, Kansas and Minnesota having half the total number. They are united into a half dozen central organizations operating along similar lines. If the wheat crop is again satisfactory the present year will see the number much larger by midsummer. If the present membership of 75,000 be increased two or three fold it will mean a vast controlling influence in the handling of the nation's agricultural products, at least so far as the plains region is concerned.

Of course, the average farmer has neither desire nor hope of great financial overturning in this movement. He wants to get more for his wheat; if he does this, he is satisfied. It costs approximately $8 to raise an acre of wheat on the cheap lands of the West and get it to market. On an average yield of 20 bushels, every cent above 40 cents a bushel is profit, and where the product is counted by the thousands of bushels it means much. It is little wonder that the settlers welcome any plan that promises a saving of three to ten cents on every bushel harvested.

The plans of the leaders of the new movement are expansive. They speak confidently of a "farmers' trust," with millions of members and tens of millions of dollars capital; of absorption of packing houses, railways, ship lines, harvesting machinery, manufactories and wholesale mercantile houses—in short, the transaction of all the farmers' business by their own organizations, and the elimination of the middleman's profit in whatever transactions they encounter. This dream of financial conquest will probably not be realized; with the extension of the co-operative idea into wider scope will come complications and problems not encountered in the comparatively simple

process of disposing of products of the fields. But there has already been acquired a measure of self-help that cannot fail to be of benefit to the communities whose wealth comes largely from wheat and maize.

Thus, apparently, the great co-operative movement will no more be opposed by the farmers than it has been by the capitalists and wage earners.

The President to the Canal Commission

They say that the President's address to the Canal Commission was rather fatherly, and was hardly needed by such responsible men. Perhaps they did not need it, but perhaps the country did need it. It was in the line of the often announced principle that must guide our colonial policy, that party politics must not cross the sea, however it may disport itself at home. Mr. Roosevelt told the members of the Commission that he had asked no questions as to their politics, that he did not know what are the political affiliations of most of them, and that they are expected to know as little of politics in the appointments they make. He has selected the best men he could get; he asks them to do the same. He will relentlessly remove them if they seem to him to fail in energy or integrity; he bids them do the same, without fear or favor, in the case of their appointees. These are very plain truths, fit to be spoken to a primary class in public business, but they are far above the comprehension of politicians at home, and their utterance is quite refreshing. How long a time must pass before this moral law, which is enacted for the Philippines or Panama, shall be applied to the Post Office Department or the Department of the Interior here at home?

Wise Labor Decision

It deserves to be remembered to the credit of organized labor that the union coal miners in seven States have recently decided, by a vote of 98,514 to 67,373, to accept a wage reduction of 5½ per cent. By this deliberate and conservative action a strike that would have involved at least 200,000 workmen was averted. The United Mine Workers are fortunate in having a wise leader. They do well to be guided by President Mitchell's advice, as they were in this instance. Another example of conservative action is seen in the acceptance, by the Amalgamated Association, of a wage reduction of 18 per cent. at the tin plate mills, pending discussion and a vote in the lodges, where it is expected that this course will be approved.

The plan of union between the Northern Presbyterian Church and the Cumberland Presbyterian Church follows the usual lines as to doctrinal basis and institutions, but there is one point that needs a little scrutiny. The following recommendation is made:

> "It is recommended that such a change be made in the form of government of the Presbyterian Church of the United States of America as will allow additional or subsequent presbyteries and synods to be organized in excep tional cases, wholly or in part, within the territorial bounds of existing presbyteries or synods, respectively, for a particular race or nationality, if deired by such race or nationality."

That recommendation is not in the interest of Swedes or Germans, but of white people in the South. The negroes in the Northern Presbyterian Church do not desire to be set off by themselves; those in the Cumberland Church are already so set off, we believe. We see no reason for such separation. If the recommendation should be adopted, it should be left to the whites who desire it to ask to be set off by themselves.

John Turner, the English Anarchist, is not helping himself by his speech in Cooper Union last week. Indeed he greatly increased the chance that he should be deported as a dangerous character. We have said that we believe that the profession of philosophical anarchism is no proper bar to the admission of an immigrant or visitor. But we do not want men here, going at large, who concoct or advise plans for the murder of Kings or Presidents. John Turner in his speech was laboriously careful not to go so far,

but only to say that he was not able to answer the question whether the assassination of rulers is an advantage to the cause of anarchism. He would not favor *advocating* assassination, he said (which would immediately have expelled him from the country); but we must consider what has been their provocation before we condemn the assassins. That condones, if it does not approve assassination.

It was Ireland—it is now Wales that is in revolt against a law of Parliament. Wales is almost solidly Nonconformist, and all the county councils refuse to rate aid to the Church schools as required by the law. And the Government will be powerless to coerce them; it could not now pass a bill for that purpose through Parliament, if one should be framed. The Churchmen are amazed at the unanimity and force of the sentiment of the Nonconformists all over Great Britain against the law. They did not know that conscience could play such a part in politics, and they never suspected that a law to support with public money schools controlled by one sect could meet opposition enough to overthrow the Government. It is clear that the law must be repealed when the new Parliament comes into power.

Verily we are a mixed population, and our journalism is as mixed. Mr. Jovo Tomanovic is editor of the *Srpska Rodoljub,* and five other editors of heterophonous Slavonic papers have united in a series of resolutions affirming their devotion to the Russian cause in the war with Japan. The principal reason given for favoring Russia appears to be that the Russians are a peaceful, non-aggressive people, who were compelled to find in Manchurian "ice free ports a natural outlet for their restless energy," and are now fighting in Chinese territory "a war of self-defense and not one of conquest." To this is added that Russia has done "enduring services to Christianity" in "subduing" so many "fierce Mongolian tribes." Doubtless she has.

In a magazine article some years ago Hon. Andrew D. White reported a conversation he once held with Mr. Pobiedonostieff, who was practically for years the dictator of Russia. He declared to our Minister at Berlin that a conflict must come between Russia on the one side, and Great Britain and the United States on the other, in which Russia must prevail, because human welfare can be assured only by the "rule of the wise." But it is, curiously enough, Japan who represents popular government in this conflict, while Great Britain and the United States look on in sympathy.

So good an authority in canon law as *The Church Standard* declares that a man can be a regular admitted communicant in two denominations at the same time, say the Episcopal and the Congregational. More than that, he can be a licensed lay reader in the Episcopal Church while he remains a full minister in the Congregational Church. That seems to us quite right; but why not go one step further and allow a man to be a regular minister in both Churches at the same time? We see no reason.

A resolution offered by ex-Governor Bullock was unanimously and enthusiastically adopted by the Georgia Republican Convention calling upon Congress to enforce the Fifteenth Amendment and reduce the representation of those States that have restricted suffrage. The convention was right in principle, but how to do what was asked will tax ingenuity.

The payment for the Panama Canal will now be immediately made, and the work of vigorous construction speedily begun. But the first thing to do is to see to it that the sanitary conditions are made as near perfect as possible. We now know enough of tropical diseases to be able to make work at Panama as healthy as on the Erie Canal. The medical staff must do the pioneer work.

It is folly to talk about President Roosevelt's "bull-headed luck." When the President holds that a law is violated and directs the prosecution of the violators, and the Circuit Court and the Supreme Court sustain him in his position, that proves sound judgment and not luck.

Financial

The Merger Distribution

Curious complications have arisen in connection with the plan of the Northern Securities Company for a distribution of its holdings in obedience to the decree of the Federal Court. This plan, if carried out, would cause a more extensive "community of interest" than has existed heretofore, but it is a community of interest that some of those who were associated in the Northern Securities Company do not like. It will be recalled that the formation of this company followed the war for control of the Northern Pacific, and that the Union Pacific and Southern Pacific (or Harriman) interests sought this control because they had not been admitted as partners in the purchase of the Burlington system by what may be called the Hill-Morgan interests, which controlled the Great Northern and Northern Pacific. In the settlement, the Harriman interests put into the Northern Securities holding company $78,000,000 of Northern Pacific stock, receiving in exchange about $82,000,000 of the holding company's shares. They would like now to recover that $78,000,000 of Northern Pacific, but the distribution plan announced on the 22d inst. would not give it to them. That plan provides for a distribution of 09 per cent. of the property *pro rata*, giving for each share of Northern Securities $39.27 par value of Northern Pacific and $30.15 par value of Great Northern. Thus the Harriman, or Union Pacific-Southern Pacific, interests would receive for their $78,000,000 Northern Pacific only $32,000,000 in Northern Pacific, with $24,000,000 in Great Northern. They do not want the Great Northern shares, but they would like to get hold once more of their Northern Pacific. With those shares in their possession, and others to which they are entitled by subsequent purchases of Northern Securities, they would control the Northern Pacific system. Such control might be regarded as more attractive than a community of interest involving all the transcontinental railways west of the Mississippi, except the Atchison.

These complications may account for the enormous purchases of Union Pacific and Southern Pacific stock on the day following the announcement of the distribution plan, when the transactions on the Stock Exchange exceeded 1,357,000 shares. In spite of diplomatic disclaimers, it was thought that these purchases and others indicated preparations for defense or attack. At first it was said that the Harriman interests did not object to the proposed distribution; afterward it was admitted that they did object. At last reports the two great railway groups were intending to ask the Circuit Court for a construction of the decree in the merger suit, and for a ruling as to lawful methods of distributing the property.

Fortunately, no quarrel over this matter is now expected by persons familiar with the situation. A sharp controversy involving railway interests so enormous could scarcely fail to cause great disturbance and loss. It will be observed that the distribution, in whatever way it shall be made, will tend to promote rather than to prevent a virtual combination of the transcontinental railways west of the Mississippi. The interests of the public will be served hereafter rather by supervision and regulation of rates than by attempts to prevent such combinations as may be made by community of interest or other methods which appear to be permitted by existing laws.

The Citizens' Central National Bank of New York

The new President of the Citizens' Central National Bank of New York is Edwin S. Schenck. Twelve years ago Mr. Schenck was Assistant Cashier of the Hamilton Bank and afterward became its President. The banking ability shown by Mr. Schenck up town attracted the attention of bankers down town, and three years ago he was elected Vice-President of the National Citizens' Bank, and subsequently became President of that bank when it absorbed the Ninth National Bank. Mr. Schenck has been influential in making one bank out of the National Citizens' and Central National banks. The combined capital of the combination, called the Citizens' Central Na-

EDWIN S. SCHENCK

tional Bank of New York, is two millions five hundred and fifty thousand dollars. Being in the center of the dry goods district, the Citizens' Central is bound to become the great mercantile bank of the city. The bank building, which was erected eight years ago, is one of the finest structures in town, and is situated at No. 320 Broadway, corner of Pearl Street, where the dry goods house of Bowen & McNamee formerly stood. The Vice-President of the Citizens' Central is Ewald Fleitmann, senior member of the well-known house of Fleitmann & Co. Mr. Fleitmann was formerly President of the National Citizens' Bank. Henry Dimse, the Cashier, was a clerk in the Sixth National Bank in 1885, and ten years later became Assistant Cashier of the Twelfth Ward Bank and afterwards Cashier and Vice-President. In 1901 he was elected Cashier of the National Citizens'. The Directors include such well-known gentlemen as James Stillman, President of the National City Bank; William Halls, Jr., Vice-President of the Hanover Bank: Edwin Hawley, President of the Merchants' Trust Company; John A. McCall, President, and Henry Tuck, Vice-President, of the New York Life Insurance Company; John P. Munn, President of the United States Life Insurance Company, and Henry B. Stokes, President of the Manhattan Life Insurance Company. William A. Wheelock and Edwin Langdon, ex-Presidents of the Central National Bank, are also Directors.

HARVEY FISK & SON and Farson, Leach & Co. were the successful bidders

Insurance

Rebating in Life Insurance

No business is more scientifically planned, more thoroughly organized and more systematically transacted than is that of life insurance; and yet, with all this, there are prevalent evils in it that greatly abridge the services it is possible to render policyholders. Given an honest management, or one comparatively so, it is well known that no old line legal reserve life insurance company can fail—that is to say, become insolvent and inflict serious loss on its policyholders. Every safeguard that experience can devise has been thrown around this system, the companies co-operating with the Government to render them uniform and effective; until now, we find it impregnable to every assault save those that may be made by dishonesty or rank mismanagement. Even these, through competition and the vigilance of the supervising authorities, are susceptible of early discovery and neutralization before they become serious.

But, as previously stated, there are evil practices indulged by the underwriting departments of some companies—the term underwriting department is used in contradistinction to the one which describes the branch devoted to the care and investment of the funds and known as the financial department—which the more conservative companies have tried, with little success, for years to eradicate. The most flagrant of these are rebating first-year commissions and "twisting" policies. Rebating may seem to the new member receiving from the agent a share of the first year's commissions as a discount on his premium, a very profitable transaction; but it is quite the contrary if the new policyholder expects to maintain his policy in force for more than one year. To begin with, in order to give the discount the agent must be in receipt of an inordinate commission for his work, and every cent he gets beyond a certain sum provided for in the tables for expenses comes out of the surplus funds belonging to older members, who, in this way, are deprived of the actual dividends saved by the company and belonging to them. In the course of time the policyholder who got the discount on his first premium will pay handsomely for it on the dividend end. It is, therefore, of interest to policyholders to keep out of companies which allow their agents to rebate, for this is the proof that the company is paying too much for new business. A little investigation will show that the companies addicted to this practice have the heaviest expense accounts and that their dividend returns to policyholders are the poorest.

Perhaps it would be well here to say a word in explanation of the term "dividend" as used in life insurance. It is not a dividend in the usual acceptation of that word. It is not a sum of money earned by the company. It is nothing more than that which is left unused of the original premium paid. All premiums are heavily loaded—all policyholders are overcharged—with the understanding that whatever remains after paying that policy's share of expenses and death losses reverts, in the shape of "dividend," to the policyholder. These savings, year by year, if not paid out or allowed as a deduction on future premiums, as in companies doing what is called an annual dividend business, go into the surplus for distribution some time in the future, as is the custom with companies doing a deferred dividend business. To rebate is to deplete this fund in buying new business.

Altho most of the States have enacted laws prohibiting, under severe penalties, the practice of rebating, it still flourishes and it becomes necessary for the public to protect itself against the seductive iniquity by refusing to insure in companies permitting it.

(*Continued from page* 753.)

for about half of the issue of $3,000,000 in New York City bonds, offered last week.

....The Middlesex Banking Company, of Middletown, Conn., of which Robert N. Jackson is President, will pay upon presentation, at par and accrued interest, the debentures due October 1st.

....A dividend of one and three-quarters per cent. on the preferred stock has been declared by the American Locomotive Company, payable April 21st. The purchase of the Montreal plant was approved last week by the Board of Directors.

The Independent

Vol. LVI NEW YORK, THURSDAY, APRIL 7, 1904 No. 2888

Survey of the World

The Candidacy of Judge Parker

All signs point now to the nomination of Judge Parker at the Democratic National Convention. A movement in his favor was seen last week in many parts of the country, due in part to indications that he would have the support of his party in the State of New York, and in part to the desire of the conservative element to organize promptly the opposition to Mr. Hearst, whose vigorous canvass had begun to excite alarm. On the 30th ult. the South Dakota convention, under the leadership of ex-Senator Pettigrew, instructed the State's delegation for Mr. Hearst, asserting that he was "the foe of Trusts and special privilege, and the champion of the laboring classes against the oppression of aggregated wealth." It was expected that he would be equally successful in Iowa, where nearly all the delegates already chosen were supporting him, altho it was said that nine-tenths of the Democrats in the Legislature were not. It began to appear last week that the South could not be induced to accept him. Some evidence that Mr. Bryan regarded his candidacy with much favor was found in a letter written on February 29th by Mr. Bryan in reply to a Democrat who asked for his views concerning candidates. Part of this letter was as follows:

"I have not thought it wise to urge the nomination of any particular person. To do so would subject me to the charge of attempting to dictate, and I have no desire to act in that capacity. I have called attention to certain men who are not to be considered because opposed to the party's position. I regard Mr. Hearst as one of the men who are to be considered, and at present he has the largest following of any person mentioned, and is the only one who heartily supported the ticket whose friends seem to be active. As I have said several times, while regarding him as one of the men who are to be considered, I have not attempted to discuss the relative availability of himself and others whose sympathies are with our side."

But no other candidate's name could be found in the letter. As to Judge Parker, Mr. Bryan recently said: "Why nominate an interrogation point?" Interviews with Democratic members of Congress showed that a large majority of them were for Parker, provided that the New York delegation should be instructed in his favor. They had been waiting for New York to make known her choice. Tammany conceded that Parker's friends would control the State convention. Mr. Murphy still opposed the giving of instructions, but some of his associates denied that he had ever been inclined to promote Mr. Hearst's aspirations. The Cleveland newspapers and prominent friends of the ex-President in the city of New York with one accord proclaimed their support of Judge Parker. It was predicted that ex-Senator Hill would soon announce his determination to accept no office from the Judge if he should be elected. Some who disliked Mr. Hill had feared that the Judge would be subjected to his influence. It was reported that even Mr. Gorman was about to withdraw from the canvass and urge his friends to vote for the Judge. At the beginning of the present week an impression prevailed that after the New York convention the only Democratic candidates in the field would be Judge Parker and Mr. Hearst. Some thought that the latter, with Mr. Bryan's aid, might control one-third of

the convention.—In a letter to a Democratic club in Michigan, General Miles remarks that we "are approaching an important crisis in our political history." The question, he says, is whether the spirit of pure democracy is to prevail or perish. "The change from oppression to liberty is wrought by violence, but the change from democracy to despotism is quiet, insidious, subtle and fatal."

Colombia Defeated at Paris

By a unanimous decision of the court in Paris, on the 31st ult., the application of Colombia for an injunction to restrain the Panama Canal Company from selling its rights and property to the United States was denied, with costs to the plaintiff. The court said that Colombia had lost control and possession of the territory in question; that the Republic of Panama was in actual possession, with the power and authority of sovereignty, and had recognized and assumed the company's concessions in its Constitution, and that it only remained for the company to accept the established authority. The suit of Napoleon Bonaparte Wyse, to whom the concession was granted, was thrown out by the court. Another case, involving Colombia's right to hold 50,000 shares of stock, will be heard on the 13th. Colombia may appeal, and Wyse says that there will be additional suits; but it thought that these will relate to an accounting between the new company and the old one, rather than to the transfer. There will be a stockholders' meeting on the 23d to ratify the sale. Two weeks may be required thereafter for making an inventory, and then, it is expected, title will pass and the money ($40,000,000 to the company, and $10,000,000 to Panama) will be paid.—Warren B. Wilson, an attorney of Chicago, has applied to the District Court in Washington for an injunction to prevent the payment of any part of these sums, alleging that, under the Spooner Act, payment to Panama is not authorized, and that payment to the company must be preceded by a treaty agreement with Colombia. It is said that the Department of Justice attaches no importance to this suit.—The Commission sailed for the Isthmus on the 31st ult., accompanied by Dr. Gorgas, of the army, and other officers who will have charge of the sanitary work.—From the Senate Canal Committee there has been introduced a new bill for the government of the canal zone, vesting in the Commission power to legislate, to collect and expend revenue, to apply our immigration laws for the exclusion of undesirable persons, to establish a court, to create a police force, etc. Laws must be reported to Congress and may be suspended by the President, who is to designate one Commissioner as Governor of the zone. Probably this office will be given to General Davis.

The Proceedings of Congress

During the closing days of the session the Democrats are attacking the Administration and the Republican majority in numerous speeches that may be of service in the campaign. Among the subjects of these addresses are the refusal of the majority to provide for a general investigation of the Post Office Department, the recent pension order, the tariff, and the alleged disregard of the President for law. Republicans assert that all the corruption in the Post Office Department has been exposed, and that a general investigation would interfere with the pending prosecutions. Prominent Democrats have spoken for a reduction of the tariff and for reciprocity. It is said that the Republican policy contemplates a revision of the tariff in 1905. The President has been vigorously defended by Senators Dolliver, Lodge, Beveridge, Spooner and others against such assaults as the one made on the 1st inst. by Senator Simmons, who described him as "a man of spectacular propensities, rash, hot-headed and impulsive; a man believed by thousands, including many in the Republican Party, to be by nature and temperament unfitted for the Presidency because dangerous to be intrusted with supreme power." Mr. Williams, Democratic leader in the House, has introduced resolutions asking the Attorney-General whether he has taken cognizance of the evidence relating to an unlawful combination of the anthracite coal railroad companies, and whether he has taken steps to enforce the criminal provisions of the Anti-Trust

law against the defendants in the Northern Securities merger case.—The Republicans have decided to support a bill for two new States, one composed of Oklahoma and Indian Territory, and the other of Arizona and New Mexico. Such a bill has been reported in the House.

Pensions for Age Disability

From Secretary Hitchcock the Senate has received an explanatory statement concerning the recent order allotting pensions for soldiers who are 62 years old. The official estimate of annual cost is $5,400,000. Mr. Hitchcock says the order merely regulates the administration of the law of 1890 without enlarging the provisions of that law, under which "the sole measure of the right to a pension is disability, partial or complete, to perform manual labor." Decisions under the law, he continues, uniformly recognize the principle that disabilities due to senility alone are pensionable. There has never been any uniform rule for rating the infirmities due to age, except that which gives the maximum to applicants 75 years old, and the minimum to those who have reached the age of 65. Such a rule was needed:

"The order in question merely lays down as a convenient rule of decision and a rebuttable presumption of fact, that one who is 62 years of age is partially disabled from earning a livelihood by his hands; that one who is 65 is more disabled for manual work; that one who is 68 is in a still greater degree incapable of earning a support by manual labor, and that one of 70 is completely disabled in this regard. Certainly such a presumption is justified by general experience in actual life."

An order granting the maximum allowance (under the law of 1890) to soldiers 75 years old was made by Commissioner Lochren, a Democrat, ten years ago, while Mr. Cleveland was President. This has been pointed out during partisan debates in the Senate concerning the recent order. Another, granting the maximum at the age of 65, was made a few years later by Commissioner Evans. The recent order has been attacked in the Senate by Messrs. Bailey, Teller and Carmack, the latter asserting that it was a flagrant and outrageous violation of law, as well as a usurpation of the legislative power. On the other hand, the order and the Department have been defended by Messrs. Spooner, Foraker, Lodge and other Republicans. In the House, Mr. Cockran has introduced a resolution directing the Judiciary Committee to inquire whether there was any authority of law for the order; if not, whether the order amounts to usurpation or invasion, by the Executive, of powers vested in the legislative branch of the Government by the Constitution.

The Land Laws

In the course of a speech against the bill to repeal the homestead and desert land laws, Senator Clark, of Wyoming, said last week that the movement for repeal was in the interest of railroad and other corporations holding large tracts of land, the value of which the proposed legislation was designed to increase. These corporations, he asserted, had for three years maintained in Washington a most determined and insistent lobby to procure the repeal of the statutes in question:

"It is no secret that they have a bureau established here for that purpose. It is no secret that they maintain a weekly organ of publication devoted to this and to this alone. It is no secret that one of the greatest of these landholders boasted in a public speech at a banquet within the last two months that his company alone had contributed $25,000 to this propaganda."

Mr. Gibson, of Montana, and Mr. Patterson, of Colorado, demanded that the name of this man be given, but Mr. Clark declined to name either the lobbyists or those who employed them. Mr. Patterson asserted that four-fifths of the land taken under the land laws in Colorado and Wyoming had been acquired fraudulently. That statement was false, Mr. Clark replied, so far as it related to Wyoming. Senator Warren also spoke against repeal.—In the case of Senator Burton, of Kansas, convicted on the 28th ult., the maximum penalty (on five counts of the indictment) is imprisonment for ten years, a fine of $50,000, and disqualification for holding a Federal office. The necessary steps for an appeal have been taken. In a letter to a friend Mr. Burton says he has done nothing wrong, and adds: "If it all could be told just as it is, the absolute truth, it would appall the world."

Labor Disputes The two counties in Colorado where martial law was recently proclaimed are still under the control of the militia. Twelve of the union miners expelled from Telluride by the Citizens' Alliance attempted to regain their homes, relying upon the injunction they had procured from Judge Stevens. Four of these were promptly arrested and again deported by the militia, who warned them never to return.—In New York no settlement of the controversy between the builders and the bricklayers has been reached, and 80 per cent. of the work on large buildings has been suspended. The bricklayers now insist that their employers shall recognize the laborers' or helpers' union. This the employers say they will never do. The associated dealers in material for buildings have agreed to close their yards and other places of business whenever the Employers' Association shall call for such action. Paralysis of the entire building industry is expected by many. —All the coal mines in Iowa have been closed by a strike of 13,000 miners. The employers refused to increase the wages of unskilled workmen. In Western Pennsylvania the miners have accepted a reduction of 6 per cent. In Illinois the operators have induced the miners to permit a slight reduction.—On the Isthmus of Panama the railroad laborers are on strike for an increase of wages and an eight-hour day. Marines are guarding the railway company's property.

Cuba and Porto Rico The treaty with Cuba, embodying the restrictions of the Platt Amendment, which was ratified at Havana in January last, has now been ratified at Washington. There is much doubt as to the fate of the treaty that cedes to Cuba the Isle of Pines. Many Senators have discovered, it is said, that they have constituents or friends on the island, where four-fifths of the improved land is held by Americans.—At its recent session the Legislative Assembly of Porto Rico passed a bill authorizing the insular Government to borrow $4,000,000 by means of 4 per cent. bonds for the construction of roads and schoolhouses, the improvement of harbors, and other projects for the public good.—President Gompers, of the Federation of Labor, failed to unite the warring factions of the Federation on the island. One of them will not submit to the authority of Santiago Iglesias, who represents in Porto Rico the parent organization. Mr. Gompers, who has returned to the States, reports that business and the industries are greatly depressed, that there are many idle men, that the average rate of wages is lower by 50 per cent. than it was under Spanish rule, and that there are about 500 deaths from starvation every month.

Exclusive Navigation Laws The Canadian Government has decided that trade by sea between Canadian ports and the Klondike shall not, for the present, be subjected to restrictions like those which are applied to trade between the Philippines and the States by bills now pending at Washington. Vessels of the United States are now engaged in transporting passengers and supplies between Canadian (and American) ports on Puget Sound and Dawson, by way of the Yukon River. By an order in council, on January 15th, 1903, such trade was confined to Canadian or British vessels. For 1903, however, this order was suspended. It was reported two weeks ago that for the present year the order was to be enforced. An American steamship company engaged in the trade that would be affected by it urged the State Department to ask that the suspension be continued. On Saturday last the desired action was taken by the Canadian Government.—Two Republican members of the House committee which has in hand the bill passed by the Senate, restricting trade with the Philippines to vessels of the United States, have submitted a minority report against this measure, asserting that it would give to a few American ships an absolute monopoly of this trade, cause a large increase of freight rates and seriously injure those industries in which hemp is used. "We do not believe it is a wise policy," they say, "to build up one industry at the expense of another, or to treat our island possessions as legimate prey for commercial piracy." The controlling consideration, they add, should be the welfare of the islanders, and commerce between the islands and the States should be free.

Latin America Our Southern sister republics are at present more or less in a state of quiescence as far as revolutions are concerned. To be sure, "chronic deviltry" is still the universal condition in Santo Domingo, but it is so disorganized that it hardly merits newspaper attention. President Morales still holds the capital city of San Domingo, tho private advices seem to indicate that Ex-President Jimenes, who is recovering from his former defeats, is collecting another following. In view of our articles a few weeks ago on the whole Santo Domingo question it is interesting to note the remarks of one Señor Galvan, who is supposed to be the mouthpiece of the Wos y Gil faction in Santo Domingo. According to Señor Galvan, if the Americans attempted to annex Santo Domingo they would be received by the

"Dominicans and Haitians with fire and sword; cities and towns would be reduced to ashes, fields laid waste, all that was destructible destroyed, and finally, every river, stream, brook and well in the country would be poisoned. Every natural and artificial advantage offered by the resources of the country would be brought into play to offer a stout resistance to the invader, and when the Americans finally triumphed they would have conquered a desolate and unhabitated country."

Thus, if this statement can be relied upon, the feelings of the Dominicans toward the United States have undergone a remarkable change since they wanted to come into the United States during the presidency of General Grant. —In Venezuela there are some rumblings that portend a possible future eruption. Ever since The Hague decision President Castro has not relished the idea of paying his debts, and for some reason or other the thirty per cent. of the customs receipts of the ports of La Guayra and Puerto Cabello, laid aside for the payment of Venezuela's debts, have been very much less than estimated. Even as estimated it would take ten years before the allies are paid off and the peace Powers come in for their share. Mr. Bowen announced to the State Department that the revenues for this year amount to 5,084,577 bolivars, which is 315,422 bolivars less than was estimated. He recommends that a little over $1,000,000 be put aside each year for the payment of the claims, irrespective of whether this is thirty per cent. of the customs receipts or not. It is said at Washington that the reason for this suggestion is that it will allay irritation among the Allies and prevent them again from taking more forcible means to collect their money. It is also reported from Washington that Secretary Hay has refused to act as bailiff for The Hague Court and collect the costs of the arbitration proceedings and turn them over to the court, as directed in the Venezuela award. Mr. Bowen has also filed a protest at The Hague against the judge's interpretation that the words "all nations" meant only England, Germany and Italy. We discuss this point elsewhere.—In Honduras a slight revolution is going on, as well as in Uruguay; but it is a factional political fight in which no principle is at stake. Reports also come to Washington that a French filibustering expedition is being fitted out to seize some territory belonging to Brazil. As this is in violation of the Monroe Doctrine, it is being watched by the Administration.

France and the Pope The Feast of St. Joseph (March 18th), the name-day of Pope Pius X, was celebrated at St. Peter's by a *Te Deum*, at which 70,000 people were present. On receiving the congratulations of the cardinals the Pope addressed them on the subject of the persecutions in France, using the following language:

"We are profoundly afflicted by the measures already adopted and the others which are being prepared in the legislative sphere against the religious congregations, which formed by their great works of charity and of Christian education the glory not less of the Catholic Church than of their country. As tho what has been already done to their detriment were not immensely grave and deplorable, it has been thought well to go farther, in spite of our repeated efforts to hinder it; for a project has been proposed and advocated which aims not only to interdict, through an unjust and odious exception, all teaching to the members of these institutes, even the authorized ones, and that solely on the ground that they are religious, but even to suppress the institutes themselves which have been approved for the very purpose of teaching, and to liquidate their property. This measure will clearly bring

about the unhappy consequence of the almost complete destruction of Christian education, which is the chief basis of all civil society, and which has been organized and fostered by Catholics under the ægis of the law and at the cost of the most generous sacrifices. The result will be that we shall have an immense number of children brought up, against the wish of their parents, without faith and without Christian morality to the incalculable loss of souls; and we shall have once more the pathetic and distressing sight of thousands of religious of both sexes wandering in indigence throughout France or becoming exiles in foreign lands. We deeply deplore and reprove such severity, essentially opposed as it is to all true liberty, to the fundamental laws of the country, to the rights inherent in the Catholic Church and to the forms of civilized society."

In reply to this Premier Combes said that the Vatican had no right to intervene in questions of national policy which were not spiritual, and that since the Vatican has not observed the Concordat, it would be more frank and loyal to denounce it as ended. As to whether the attitude of the Pope would not prevent his receiving a visit from President Loubet when he goes to Italy, M. Combes said the President had never dreamed of visiting the Pope.

Farthest South

The British Antarctic exploration expedition in the steamer "Discovery" has reached Lyttelton, New Zealand. The "Discovery" has been in the ice near Mount Erebus and Terror ever since December, 1901. From there Captain Scott, with two other men, started for the Pole by sledge along the coast of Victoria Land and reached 82° 17′ S., 163° E., which is the highest latitude yet reached in the Antarctic regions. In 1843 Sir James Ross reached 78° 10′, and in 1899 Borchgrevink reached 78° 50′. In the Arctic regions the highest records are those of Nansen, 86° 4′ N., in 1895, and of the Duke of the Abruzzi, 86° 34′, in 1899. Captain Scott and his companions lost all their dogs and had to drag back their sledges. A year ago a relief ship, the "Morning," visited the "Discovery" with supplies, and last October the "Morning" and the "Terra Nova" started south to release the "Discovery" from the ice, which was accomplished on February 14th by blasting a channel through the ice pack with dynamite. The "Discovery" had only 10 tons of coal in her bunkers when Auckland was reached. All members of the expedition are well, and have not suffered severely during the past year, altho the cold has been at times 60° below zero. Victoria Land is a vast continental plateau, 9,000 feet above the sea level, and there are many great glaciers.

Fighting in Tibet

The first armed opposition of the Tibetans to the advance of the British expedition occurred on March 31st, at Guru, where the Tibetans resisted an attempt to disarm them and were routed with terrible slaughter. A force of Tibetans numbering about 1,500 had been assembled at Guru, and as long ago as January 28th a general of the Lhasa district had an interview with Colonel Younghusband telling him that the consequences would be serious if he did not withdraw. Notwithstanding this warning and the threatening attitude of the natives, the expedition started at 8:20 A. M. on its way toward Gyangtse and Lhasa. As the British approached the wall which had been built across the road near Guru, about four miles from their camp, a general from Lhasa came forward and had an interview with Colonel Younghusband, the leader of the mission, and General Macdonald, in command of the military escort, in which he demanded that the British retire to Yatung for the purpose of further negotiations. Colonel Younghusband replied that negotiations had been going on for fifteen years without result, and that he should proceed. When the Tibetan general had galloped back, the troops were ordered to disperse the natives without the use of arms if possible. It seemed for a time that the obstruction could be removed peaceably, but it was thought necessary to disarm the Tibetans, and for this purpose the Indian troops deployed on each side and completely surrounded them. The general staff rode up to the wall to watch the disarmament and the newspaper correspondents were taking notes and snap shots, when the Lhasa general fired his pistol and wounded one of the Sikhs. At this signal the Tibetans attacked with desperation the ring of troops surrounding them. The Tibetans were mostly

armed with matchlocks, swords and bows and arrows, and none of the British force was killed, altho several were wounded, the most severely injured being Mr. Chandler, correspondent of the London *Daily News,* who received twelve wounds. His life was only saved by the prompt action of General Macdonald, who seized a rifle and shot down two of the Tibetan swordsmen attacking him. The fire of the British soldiers from magazine and machine guns directed into the crowded mass of Tibetans was very destructive, killing 300 or 400 of them and wounding about as many more. The Tibetans fought with fanatical fearlessness, rushing on the troops over the heaps of dead, and in some cases not falling until pierced with a dozen bullets. When they finally retreated they marched slowly and steadily back to shelter some four hundred yards away, altho a mountain battery was cutting through their ranks with shrapnel. Among the slain were the Lhasan general and one of the lamas who has been most energetic in rousing the natives to hostile action. The general's escort were armed with rifles bearing the Russian imperial stamp and were provided with Russian ammunition. The village of Guru was captured with the aid of artillery, and the expedition will proceed on its way to Gyangtse, about 75 miles distant.—This engagement following so soon upon Lord Curzon's aggressive speech has produced great excitement in both Russia and England.

German South-west Africa

The German troops so far have driven the natives before them in their advance into the interior without any serious losses, tho not without hard fighting. On the 25th of last month Major von Estorff's column encountered a large force of Hereros at the waterhole Otuehinanaka, about 100 miles east of Omaruru, and only succeeded in dislodging them after ten hours' fighting, in which the German loss was six and the native 25, including three chiefs. Eight hundred head of live stock were captured. Some 5,000 well armed Hereros are in the field, and a rising of the Ovambos is feared. Colonel Leutwein, the Governor of the colony, has asked for 1,000 more men, mostly mounted. The garrison at Grootfontein is now threatened by the insurgents. As the troops reach the ranches of the German settlers and find heads and parts of the bodies of men, women and children nailed to the doors and roofs of their homes, they are becoming bloodthirsty and vengeful, and, according to a missionary letter, they are imitating the natives in the savageness and brutality of their reprisals on prisoners and non-combatants. The number of German settlers who were killed outright or tortured to death is said to be 113 in the district of Okahandja alone. There was no suspicion of the real feeling of the natives toward the whites before the outbreak, and the leaders of the Hereros were apparently friendly with Colonel Leutwein; some of them are wearing decorations and swords of honor bestowed on them by the Governor in the name of the Emperor.

The Russo-Japanese War

The Russians have made no very energetic efforts to oppose the Japanese advance, altho it would have been easy in such rough country to have harassed them much more than has been done. The Japanese outposts are now stationed at Sonchon, on the coast about twenty-five miles south of Wiju, which is said to be occupied by 2,000 Russian troops, strongly intrenched. Chonju, which occupies a position easy of defense and where there is a Korean fort, was abandoned by the Russians without a struggle. Here the Japanese were attacked on the morning of March 28th by General Mistchenkof with six companies of Cossacks. After half an hour's fighting three squadrons of Japanese cavalry left the town for Kasan, pursued by the Russians. Receiving reinforcements the Japanese again advanced to the attack, whereupon the Cossacks retired in good order. Both sides claim to have inflicted great damage on the enemy in this encounter, the estimates running from 50 to 500, but the Russian official report says their loss was six killed and 12 wounded, and the Japanese officially announce that on their side there were five killed and 13 wounded.—The Paris *Figaro* claims the authority of the general staff at Harbin for the following estimate of the Russian strength in Man-

churia: Infantry, 170,000; cavalry, 17,000; cannon, 256. Of these, 20,000 infantry, 5,000 cavalry and 32 cannon are detailed to guard the railway. Within two months this force will be increased by 130,000 infantry, 30,000 cavalry and 250 cannon.—At a meeting held under the auspices of the Young Men's Christian Association in Tokyo to celebrate the fiftieth anniversary of the signing of the opening of Japan by Commodore Perry it was proposed by Bishop McKim to raise a fund to be called the Perry Memorial Relief Fund for the destitute families of Japanese soldiers and sailors as a proof of American friendship and sympathy. There was a spontaneous responce to this appeal by both Americans and Japanese, and 75,000 yen were subscribed in a short time. The committee in charge of the fund is composed of representatives of the American Asiatic Association, the Standard Oil Company, the Imperial University and the steamship lines. There are said to be over a thousand destitute families of Japanese soldiers already.—The Special Diet called to vote appropriations for the war has adjourned after providing for additional taxation which will raise some $31,000,000 annually. Banks are authorized to raise money, which may be borrowed by the Government, by means of a scheme of savings debentures with lottery drawings. The duty was increased on such articles as sugar, silk, kerosene and alcoholic beverages with more than 50 per cent. alcohol.

Persecution of the Armenian Church

The action of the Russian Government in practically confiscating the funds of the Armenian Church has awakened an agitation that will not be allayed. The "Catholicos of all the Armenians," Mkotish, has addressed a most humble petition in the name of his four million fellow churchmen to the Czar, asking that at least the execution of the new law be suspended for the present. As an answer to this impressive document, which is published in full in the *Vossische Zeitung*, of Berlin, No. 22, the Russian Minister of the Interior merely telegraphed that the document had been received and brought to the attention of His Majesty. That it will not change the policy of the Russian Government is evident from the vigorous measures which it has applied in the processes against the Armenian Protestants in Eriwan. Immediately after the publication of the decree thousands of Armenians flocked to the palace of the Catholicos in Etshmiatzin, to protest against the Government's taking the Church funds and properties. The political authorities at once interpreted these popular demonstrations as revolutionary acts and took measures to punish the rebels, the State prosecuting attorney asking that the guilty parties be banished to Siberia for a period of twelve years. The Armenians at once endeavored to engage the services of the Russian advocate, Karobschewski, who did such excellent work in the defense of the Jews in Kishenef, but the latter declined to go to Eriwan, for the reason that, since his work for the Israelites, the Russian Government was strongly prejudiced against him. In a most loyal manner four attorneys of Moscow and two Armenians from Tiflis undertook the defense of the accused Armenians, and they were able to prove that the popular demonstrations before the residence of the Catholicos were religious and not revolutionary acts, in perfect accord with methods that had for centuries been in vogue in the Armenian Church at critical periods. Accordingly, fifteen of the accused were acquitted, nine were condemned to an imprisonment of eight months and three to four months. Notwithstanding this failure of the Government in the trials, its representatives continue to treat the Armenians as rebels and revolutionary people. In Kamorla, not far from Eriwan, twenty-four men were recently arrested, the Armenian Mayors of Shushi and of Tiflis have been banished, the Archbishop of Eriwan, Parzian, and the Archimandrite Muradbegian have met with a similar fate. The few Armenian papers that have been published in Transcaucasian districts have been suppressed. Even the purely church organ, the *Ararat*, the official organ of the clergy and the Catholicos, is no longer. The two Tiflis periodicals, *Nor-Dar* and *Nashak*, have now been added to the list.

The Facts About Suicide

BY GEORGE P. UPTON

[For many years Mr. Upton, as associate editor of the *Chicago Tribune*, has been the only authority as to statistics bearing upon suicide, lynching and other subjects of large and pressing public importance for which there are no official records that have been completely grouped and classified.—EDITOR.]

ASSUMING that suicide is a crime, it is difficult to declare which is our national crime, suicide or homicide—the murder of self or the murder of others. The approximation of totals through a given period of years is remarkable, as is the ratio of increase; tho the increase of suicides is not marked by as large fluctuation from year to year as that of homicides, in which latter term all cases of death by violence are meant to be included.

What are the facts about suicide? During the last thirteen years 77,617 cases of suicide have been reported in the newspapers of this country. The following table shows the total number per annum, as well as the increase from 1891 to 1897, the curious decrease in 1898 and 1899, and again the increase from 1899 to 1904, which almost duplicates that from 1891 to 1897:

1891	3,531	1898	5,920
1892	3,860	1899	5,340
1893	4,436	1900	6,755
1894	4,912	1901	7,245
1895	5,759	1902	8,132
1896	6,530	1903	8,597
1897	6,600		
Total			77,617

The increase in cities already has been noted by Mr. Frederick L. Hoffman, the life insurance statistician. It proportionally tallies with the general increase all over the country. In 1902 there were 2,500 cases of suicide reported in fifty cities in this country. In these cities the number has about doubled in ten years. Incidentally, it is interesting to know that St. Louis has the largest number in proportion to its population, and these eleven cities follow it in the order named: Hoboken, Chicago, Oakland (Cal.), New York City, Milwaukee, Cincinnati, Newark (N. J.), Brooklyn, Boston, Indianapolis and New Orleans. To Fall River (Mass.) belongs the credit of the lowest rate, 2.7 per 100,000.

The increase of suicide, however, is not confined to this country. In France the rate is now 22.4, as against 15.7 per 100,000 twenty-five years ago; in Germany, about the same; in Austria, 3.9; Hungary, 2.7; in England, 1.5, and in Scotland, 1.8. It is singular that in Russia, where crime has greatly increased and where the conditions of life are supposed to be harder and more depressing than in other countries, there has been no increase in the suicide rate. The increase in European cities also has been exceedingly rapid. In Dresden the rate is 51 per 100,000, in Paris 42, in Berlin 36, in Vienna 28, in Stockholm 27 and in London 23. Lisbon and Madrid report the lowest rates, being only 2 and 3 per 100,000 per annum, respectively.

Suicides are more common among men than women in all countries. Of the 77,617 persons tabled above, 57,317 were men and 20,400 women. Between the ages of ten and twenty-five suicides of women are more numerous than those of men between the same ages. It is one of the saddest features of the case that suicides of women are increasing faster than those of men. Half a century ago five times as many men committed suicide as women. A quarter of a century ago the proportion was three men to one woman. During the last three years the ratio has been about 2½ to 1.

Another sad feature of the suicide situation is the increasing number of children who kill themselves. These suicides are almost without sufficient cause, and sometimes without any. A slight from a playmate, a reprimand at home, a rebuke from a teacher, envy of the success of a companion, pique over a fancied insult, disappointment over an ephemeral love attachment in the case of weak and morbid and sometimes degenerate natures, account for many juvenile suicides. Weak-minded children of this kind seem

to believe that instead of exciting pity for their foolishness they will punish those who have presumed to interfere with their caprices by killing themselves. Evidently there is not only something wrong with children who set such small store upon life at a time when life is most attractive, but also in the homes where such youthful neurotics are reared.

Another singular feature of suicide is the comparatively large number of physicians who kill themselves each year—large, that is, as compared with members of other professions. In the last thirteen years 535 physicians in the United States have committed suicide—an average of about 41 each year—as compared with 98 clergymen and 61 attorneys, only those enjoying some prominence being taken into account. A prominent Western physician was once asked by the writer what reason he would assign for this. He suggested that familiarity with illness and death made them every-day affairs; that physicians afflicted with ailments which they knew, better than any one else, to be incurable saved themselves long and unnecessary suffering in this way, and that many of the profession, worn down with the strain of attendance upon patients, the interruption of regular hours and the wear of insomnia upon the system, were addicted to the use of drugs, at first as stimulants or narcotics, which in the end became a habit they could not shake off and ultimately ruined both body and mind. Whatever the causes may be, the facts are as stated.

The causes of suicide are many, depending largely upon the whims, moods and temperaments of individuals, and most of them may be summed up under the general head of depression, which will account for more than half of the 77,617 before noted. The rest may be classified as follows: Insane, 5,748; ill health, 4,206; domestic infelicity, 4,365; liquor, 3,459; disappointment in love, 3,008, and business losses, 1,389. The last item is surprisingly small, and corrects the general belief that large numbers of men are driven to take their lives because of business reverses.

The agencies for self-murder are numerous, but 61,933 of the 77,617 victims have killed themselves either by poison or the revolver. Prior to 1894 the larger number shot themselves, but since that year poison has headed the list. It may be boldly affirmed that the steady increase in the use of poison is due to the ease with which carbolic acid can be obtained. More persons kill themselves with it than with all other kinds of poison combined. It is cheap—within the reach of every one; and it is certain in its effect. Most other poisons can only be had on presentation of a doctor's prescription; but carbolic acid can be had as freely as flour or sugar. It is in general demand for domestic use and it is easy, in this way or by other plausible reasons, to get it from the druggists. In Chicago, in 1902, there were 147 cases of suicide by poison, and in 127 of them carbolic acid was used. It is not unlikely that legislation restricting its use would tend to decrease the number of suicides; but it is urged, on the other hand, that any such action as would make it difficult to obtain would be a hardship in the home where it is in such common use as an antiseptic. If this be true, then chemists should suggest some other equally efficient antiseptic of equal cheapness. The promiscuous sale of other poisons is forbidden. Why not that of carbolic acid?

Turning to the other agencies, we find that 2,976 ended life by hanging, 6,091 by drowning, 4,447 by the knife, 809 by throwing themselves in front of locomotives, 763 by jumping from roofs and windows, 294 by fire, 77 by dynamite, and 227 in miscellaneous ways, some of them displaying remarkable ingenuity and courage on the part of the self-murderers.

These are the gruesome facts. They show that suicide is rapidly increasing; that the value of human life is, comparatively, decreasing. The ethics of suicide have greatly changed. The question—Has any one the right to end his life when he has no further use for it or is dissatisfied with it?—is rarely asked now. In the old days a jury in a suicide case usually declared the victim "*non compos.*" Such verdicts now are rare. It is assumed that a person may have a sufficient motive for suicide, and may be entirely sane when he takes his life. In the old days, also, the Church treated suicide victims much as it did murderers, and not only condemned them to eternal punishment, but to earthly ignominy by

refusing them Christian burial; but, with the increased weakening of ecclesiastical authority and a growing doubt of eternal punishment and, sometimes, uncertaity as to the definite nature of the hereafter, this restraint has largely disappeared.

It is more a question now for the alienist than for the theological doctors. It is a problem every one must study for himself. Legislation against suicide has not checked it, in any case. Perhaps, however, it might be easier to arrive at an intelligent decision upon the ethics of suicide if the home had more authority in regulating appetites, passions and habits than it does now. Equally there might be more hope for the decrease of crime of all kinds if so many homes were not sending out so many boys and girls unwarned, undisciplined, uninstructed and unprotected.

CHICAGO, ILL

The Beginnings of A B C

BY ANDREW LANG

HOW did men first come to invent their A B C? Whence did the familiar letters arise? In half a century—between the edition of the "Encyclopædia Britannica" of 1853 and the *new* (not the *old*) volumes of the *Times* edition—three sets of answers have been given. The third time is lucky! In 1853 the writer in the "Encyclopædia" on the Alphabet kindly offered us a choice of three theories. 1. Adam invented letters. 2. Letters have existed from all eternity. 3. They came by divine revelation,—to somebody unnamed. This lacks common sense!

Next, if you look up "Alphabet" in the *old* volume of the *Times* edition (1875), you will find something more sensible, but almost wholly erroneous. The letters, we learn, came thus: First, savages design pictures representing a series of events, and draw them in skeleton outlines, like Tommy Traddles in "David Copperfield." To take a Red Indian example, you scratch twenty-three erect strokes on a bit of birch bark: *that* means twenty-three braves. Then you draw a bottle-nosed face, with short hair sticking up all round it, head, cheeks, and chin. That is the sun. Below it you put ten horizontal strokes; this means that the twenty-three warriors were for ten suns, or days, on the war-path. You next sketch three rude ground plans of forts; this means that three English forts were attacked. You put in ten isosceles triangles reversed, with their limbs produced from the apex. This means ten men lost to his Britannic Majesty's forces. On the bases of four of the ten triangles are dots. This means that four of the ten English soldiers have kept their heads on, and are living prisoners. You now draw a tortoise in one corner; this may be the signature of the writer, a man of the tortoise totem; or it may symbolize *land*, and mean "all right."

This process is pure "picture writing." You can understand it without knowing the Choctaw language.

The next step is to draw real objects with a symbolical meaning: a picture of a pipe stands for peace, of a bird on the wing for "hurry up," of a fire for a family. A tract printed for the conversion of the Mikmak Indians needed 5,701 of these characters, and the results perhaps did not justify the outlay.

The next step toward the alphabet is to draw pictures which represent the sounds of words. To make "buoyant" (sounds *boyant*) you design a skeleton figure of a boy, and another of an elderly lady, his aunt. There was a Mexican king called Itzcoatl, from *itz* (a knife) and *coatl* (a serpent). His name was written with pictures of several knives on the back of a snake.

By these steps we reach ancient Egyptian hieroglyphs. The Egyptian word for an owl was *mulak*. First an owl was represented, cut on stone, an unmistak-

able owl. Next, the owl picture stood for the syllable, or sound, *mu,* the first syllable of *mulak.* Next, the owl picture means only M. Then the Egyptians took not only to cutting inscriptions on stone, but also to writing on paper made of papyrus. The scribe scamped his owl, and produced a skeleton picture rather like a goose with a broken neck, looking over its shoulder. A yet more rapid style of writing, in very thick ink, called the "hieratic" style, reduced this figure of a ramshackle goose to a dissipated 3 or a *b* of undecided character.

Now the theory of the origin of our alphabet, in the *old* volumes of the *Times's* "Encyclopædia Britannica" (1875) is that the Phœnicians, say, about 1500 to 1200 B. C., borrowed their letters (which are certainly the origin of our modern A B C, *as we now use them*) from these hieratic Egyptian scribbles, which again descend, as we saw, from Egyptian pictures of owls and other animals and things.

This theory, worked out by the Vicomte de Rougé, in 1859, was not published till 1873, because his manuscript had been lost: luckily a rough draft was discovered after his death. The theory is, we must remember, that men first made a picture, say, of an owl, then the picture came to represent the first syllable *(mu)* of *mulak* (an owl), then the picture stood for the first letter only (M) of *mulak,* then the picture, written in pen or brush and ink, degenerated into a scrawl, then the Phœnicians adopted the scrawl, and circulated it in commerce as part of an alphabet. Then the Greeks borrowed it and made it M. Finally the Romans borrowed it from the Greeks, and our ancestors from the Romans. And so on with the other letters.

B was an Egyptian crane, Z was a duck, L was a lion couchant, R was a human mouth, and so forth, and so forth.

This theory, which is stated here from Mr. Isaac Taylor's book, "The Alphabet" (1883), is de Rougé's theory, and the theory of the *old* first volume of the *Times's* "Encyclopædia Britannica." Prof. Max Müller and many other learned people accepted it, and it ran for about twenty years, more or less. But Lagarde, a great scholar, made objections. I need only mention *one,*—the Phœnician letters, as a rule, were ***not in the least like*** the hieratic scribbles, not to mention that the hieratic scribbles were ***not in the least like*** the pictures of the owls and cranes and ducks from which, according to the theory, they were derived. To the *ordinary* mind that one objection is very strong. For example, we are led to believe that A was, first, a picture of an eagle (hieroglyph), then became like a snake erecting its crest (hieratic), and then two strokes meeting in an angle, with a third stroke across them (like our A if you laid it down on its left side), and *that* was the Phœnician letter *aleph,* which means "an ox." Set on its legs again, it became the Greek *Alpha,* our A. The Phœnician letter, *aleph,* an ox, in fact, is rudely like an ox's head, with horns. The original hieroglyph, the eagle (a serpent in hieratic), is *diablement changé en route* when it becomes an ox's head, horns and all. The hieratic form is infinitely more like an ox's tail! A human mouth (hieroglyph) is not like a serpent biting its own stomach (hieratic), nor is "an inundated garden" (hieroglyph) like a horned serpent (hieratic), while *that* is unlike a small written *w* (Phœnician), which, stuck up erect, is the Greek Σ, our S. A bowl (hieroglyph) does not resemble a tomahawk (hieratic), nor is *that* like a three-pronged fork (Phœnician), our K.

For these eminently commonplace reasons, which at once occur to the human mind, de Rougé's theory looks "too thin." This it does even while we remember that the hieratic characters in Egypt were written with thick black ink on a kind of paper, while the Phœnician letters were chipped on stone, with a natural preference for straight lines, which would cause them to lose likeness to the curved hieratic. It was on stone that the Egyptians chipped their hieroglyphs, yet these pictures are full of curves. However, there is another argument against the theory that the Phœnician letters were borrowed from the Egyptian hieratic. Not only are they quite unlike hieratic characters, but characters very like the Phœnician letters, and still more like our own, were common in Egypt and Southern Europe from France to Egypt, long before there was any hieratic writing at all, or even any hieroglyphs. Nobody knows how

many tens of thousands of years have passed since skin-clad men, armed with huge sharpened chipped flints, hunted the reindeer and the mammoth in France and England. These men, especially in France, were admirable artists; their sculptures, etched sketches and paintings of mammoths, reindeer, horses, kine, pike and trout are simply astonishing. They are clearly designed with the eye of the artist on the object. Now, on decorated bones and reindeer horns left by these people, far more ancient than the Egyptians, we find a few alphabetic characters, such as the Greek U and an old Greek character like an arrow with a barbed head, and the letter A, and other recognizable letters, such as E, I, on painted pebbles of this race. Why they made these designs, which look like real letters, is not known; perhaps they were owners' or artists' marks: they are not mere ornament.

Next, on Egyptian pottery perhaps of 6000 B. C., Prof. Flinders Petrie has found all the letters of the Greek alphabet at large, thousands of years before the Phœnicians ever wrote a line. Many of these letters are more like our own than they are like the Phœnician or Greek, but the most common is what I have called the three-pronged fork, with the prongs very wide apart, the Greek *psi* (Ψ). Taking them at random, we find our B, the Greek form of P, our E, F, O, I, H, V, the Greek L (V reversed), the Greek φ (phi) A, the Greek G, the Greek Z, T, the Greek D X, in a line the Greek for A L T; M Y with a sign exactly like a ball going over the bails of four stumps; a wicket with the central stump bowled down (leaving the bails out!); N, the Roman thirteen (XIII), our I D, and so on, with many other characters *not* found in real alphabets.

This is not nearly all. In 1873 Dr. Schliemann found several of the signs engraved on clay "whorls" on the site of Troy, but of an age long before the Phœnicians were busy. Then Mr. Arthur Evans noticed many signs like writing on very ancient seals of the Greek islands, and he concluded that there was writing before the Phœnicians invented our alphabet. He discovered many more such seals in Crete, and, at last, dug up whole libraries of clay tablets, with writing in lines, "linear writing," all very much older than Phœnician trade. He also found most of the Greek letters engraved on bone fishes, perhaps counters in a game, one letter on each fish. We do not know what the very early Egyptian meant by the characters so like our own letters. We do not know what the Clydesdale people meant by several of the same characters on their slate amulets. I ought to say that the gentlemen who found them (Mr. W. A. Donnelly and Mr. John Bruce), never said anything about these characters, nor did those who called the things forgeries. I only happened in December, 1903, to notice the Egyptian resemblances. However, Mr. Evans's Cretan finds certainly were covered with real writing, long before the Phœnician "invention" of the alphabet. On a Cretan seal of perhaps 2500 B. C. he found two characters. In Greek they would read (in our letters) U over P and the same U over P come on a slate amulet discovered in the Clyde! This must probably be a mere chance coincidence, but it is odd. In some of Mr. Evans's seals you see rude skeleton pictures turning into letters, but one bears the monogram K M and the other the monogram W P, if read as our own letters; also there is M D in a monogram. On one broken stone table Mr. Evans found that, out of four characters, three tallied with old Greek forms, tho a thousand years earlier than the oldest known Phœnician (or, rather, Semitic) inscriptions. Three also appear in Libya, on the southern side of the Mediterranean.

What is perhaps still less expected, the greater part of the alphabet turns up in regular inscriptions from stones above tombs, in Spain and Portugal, the X being the same as the Red Indian figure that represents a man with his head off. These tombs are prehistoric, and earlier than Phœnician trade in Spain. Nobody doubts that these Spanish and Portuguese letterings on tombs—epitaphs, in short—are genuine. They are written between horizontal incised lines, as children are taught to write on ruled paper.

Next, similar characters, thirty-four in all, were found on various small tablets of stone, under a dolmen, or artificial chamber of gigantic unhewn slabs of rock, in Portugal, in 1895. The A lies on his left side, like the Phœnician *Aleph*.

The Greek U, K, L, M, N, H, Ps., D, I, E, and other characters, can be recognized by a child. Now these dolmens were raised by people who have left no metal implements, only knives of hard stone and axes of the same, with minute fragments of the rudest pottery. It should follow that alphabetic characters (whatever their meaning may have been) were well known to people in Portugal thousands of years before the Phœnician sailed to the pillars of Hercules, and

"Sly traffickers, the dark Iberians came."

But the alphabetic marks were found with a cartload of little stone female idols, stones marked with small, round cups, stones scratched with grotesque figures of beasts, stones rudely shaped like queer animals, and others with grotesque human faces.

Thus we cannot say that these very ancient Portuguese letters are genuine, tho the late Don da Veiga believed that letters were of this vast antiquity in Portugal, and he was the highest Portuguese authority. The objection that "early Portuguese did not write Greek" was made by somebody who did not know that signs resembling old Greek letters are "all over the place." They occur on the pots of an ancient people in Panama, and in the tattoo marks of natives of New Guinea, as well as in Europe and Egypt.

The conclusion arrived at by Mr. Taylor, in 1883, that all alphabets descend from the Egyptian pictured hieroglyphs, through the Phœnicians, is therefore abandoned, or reckoned less probable, in the *new* volumes of the *Times's* "Encyclopædia Britannica," under the head "Writing." As Prof. Flinders Petrie says, "The so-called Phœnician letters were familiar long before the rise of Phœnician influence." The Phœnicians only selected and adapted, as numerals, about half of the older signs, the others vanished, except in Asia Minor, Spain and Portugal. There is not one early Greek alphabet, but many, "so diverse that each has to be learned separately." "Each tribe had its own signs for certain sounds, varying a good deal, yet each had to follow the same numerical system."—that is, had to use the same signs for numerals (1, 2, 3, 4, 5, etc.) as the Phœnicians used in commerce. "The history of the alphabet is as old as civilization." To-day we write (at least in U, T, E, I, A) letters which the reindeer and mammoth hunters of France used for some purpose of their own, a countless number of thousands of years ago. Were these signs in origin degenerate skeleton pictures of things? I doubt it! The reason of my doubt is that Melanesians in New Guinea, and prehistoric Chiriquis in Panama, and prehistoric Egyptians before the Pharaohs arose, and dwellers in Spain and Portugal, and men in France when mammoths roamed there, were not very likely, if they began by drawing animals, to simplify the designs into the same alphabetic looking forms all round the globe.

The Trinity

BY KATHARINE LEE BATES

Her prayer-books had repose,
One word her heart sufficed,
Scent of a hidden rose:
"Christ!"

To creeds her soul was shut,
For her confession of
The Christian faith was but
Love.

She craved no temple-wall.
Between the sky and sod
Her happy world was all
God.

Wellesley, Mass.

War News from Japan

BY J. H. DE FORREST, D.D.

[Dr. De Forrest, who has been a leading missionary in Japan for many years, and who understands Japanese people as well as anybody we know, has been registered as a war correspondent for THE INDEPENDENT in Japan and has access to all the available information.—EDITOR.]

THERE is none. That is the exasperating difficulty,—that while there is an abundance of exciting material, no one is permitted to get at it. The thirty-six war correspondents of the world's ablest papers, employed at war rates, are cooped up in the Imperial Hotel in Tokyo, aching to know of the movements of troops and desperately eager to go to the front in Korea, Manchuria, anywhere, but they are detained here, ignorant and helpless, and rather mad. One illustration: Military attachés to the legations are supposed to have the inside track. One of these privileged soldiers asked permission at the War Department to witness the departure of a brigade of troops in order to see how they did things. "Certainly," was the prompt reply. "There will be a grand send-off from here on Tuesday at eight o'clock." When the time came the attaché naturally went to the main station, but not a soldier was in sight. It then dawned upon him that there were six other stations within six miles, from which they could have started. Well, it is now stated that after the first land battle, which is expected within two or three weeks, the war correspondents will be permitted to go to the front, but even from that place of advantage no news

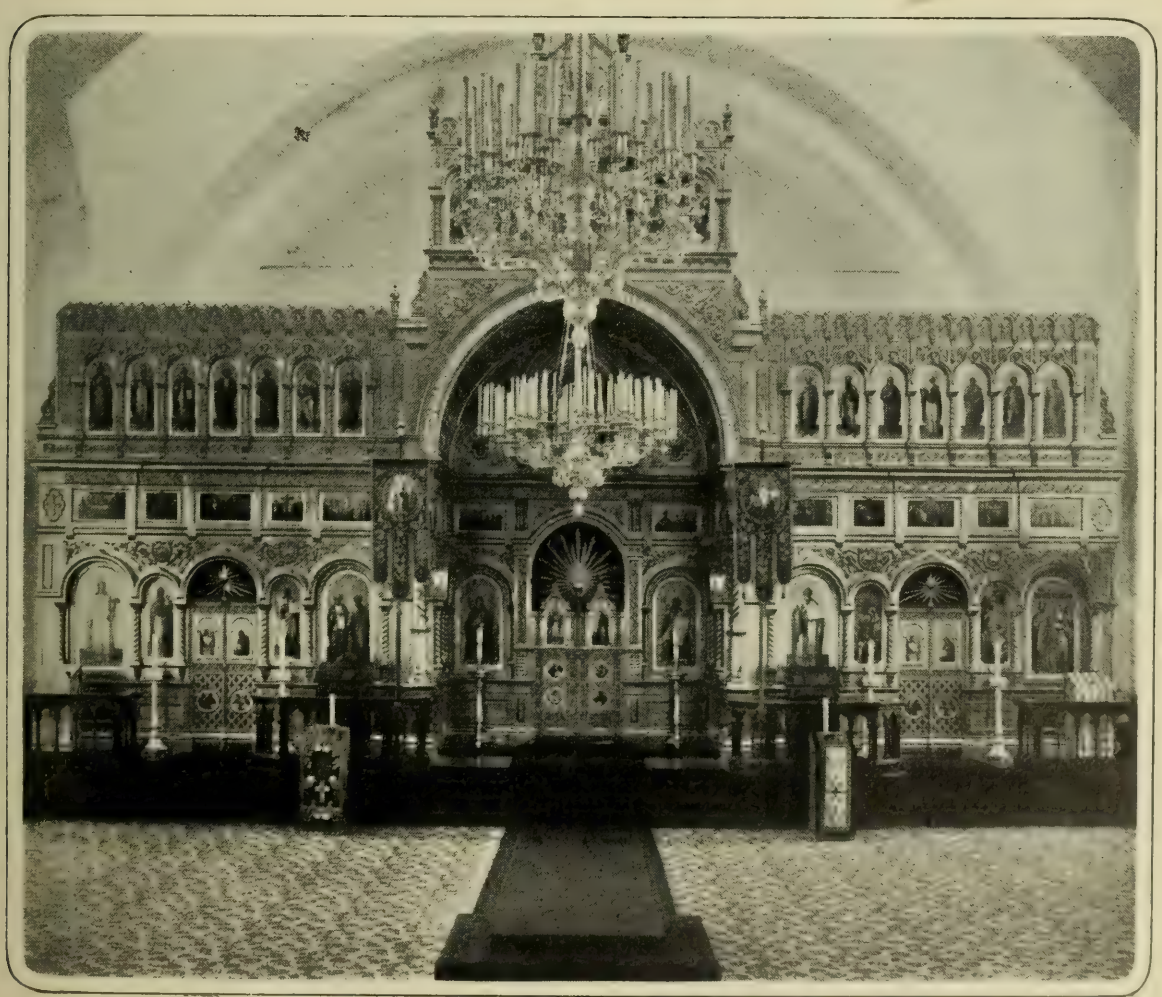
ADMIRAL SOTOKICHI URYU

Russian Cathedral at Tokyo—Exterior View

will go to the West without the scrutiny of the authorities. For " war is not carried on for the sake of war correspondents."

Still there is no lack of interesting materials at this crisis. One can study the Japanese and find out some of the forces that are behind this national uprising. The police, for instance, are in evidence. I went yesterday to the Russian cathedral in Tokyo on the hights of Suruga Dai. In the days of anti-foreign feelings this conspicuous building was an eyesore to excitable Japanese, and but for the protection of the police was considered in danger of dynamite. The situation now is much more grave. An unusual atmosphere pervades the whole neighborhood. As I entered the gates policeman after policeman watched me, and three came near enough to hear my request to the porter for photos of the cathedral and of Bishop Nicoli. This Russian bishop has been in Japan over forty years, and the widely known Dr. Neesima was his teacher of Japanese. The long, unselfish service of this bishop and his deep friendship for the Japanese have endeared him to thousands of this people. But for all that he is a Russian, and has taught thousands to pray for the Czar in the same sentence with the Emperor of Japan. In this crisis he has unqualifiedly counseled his converts to pray for victory for Japan, since Christianity demands this patriotic spirit on the part of all Japanese subjects, while he himself will no more attend cathedral services, but will pray in private for his beloved Czar and for Russia.

It is indeed a hard time for the Greek Church in Japan. Some of its members have been arrested under suspicion of having given information and plans of fortifications to Russians. It is doubtful whether this church, which began with signal success some twenty years ago, can ever again flourish on Japanese soil unless the map of Japan is enlarged to include Eastern Siberia.



The placing of police around this cathedral is a measure of precaution. The same precaution is taken with all the legations save those of England and the United States. What could show the whole trend of public opinion better than this? France is Russia's ally, and Germany joined in ousting Japan from Port Arthur nine years ago. It is doubtful whether France's offer of Red Cross aid and the munificent contribution of the German Minister here to the aid of distressed families of absent soldiers will do much to lessen the deep feeling of dissatisfaction that pervades the whole nation over the part these two Powers played in the retrocession of Liaotung Peninsula. Nothing will wipe that from the memory of Japan but their hearty approval of the reoccupation of Port Arthur on the part of Japan. Meanwhile what a testimony it is to the sympathy of the Anglo-Saxon nations that no policeman stands at the gates of the Eng-

lish and United States legations. The people guard those two gates.

Even Marquis Ito's place has for months had a police guard. Lover of peace as he is, he was carrying it too far for the people to endure. Some of Japan's best blood has been shed by *soshi* assassins, whose graves are kept adorned to this day with floral offerings. It is well to head off any possible successors to the assassins of Okubo, Mori, and—of Count Okuma's leg. All this precaution is but a sign of the irresistible determination that is behind the whole nation, and which is shown in another way by the stream of precious treasures that is flowing into the vaults of the Bank of Japan long before there is the slightest need of such sacrifices. It is but another expression of the final resolution of the people to fight, let it cost what it will, till the permanent victory be Japan's.

If the press, foreign and native, is muzzled so far as movements of army and navy are concerned, there is a flood of information about the chief actors at the front. That brilliant beginning of hostilities by the navy at Chemulpo has brought out in every paper and magazine of importance a picture of Rear-Admrial Uryu, with sketches of his career such as could be obtained from the War Office or elicited from Mrs. Uryu. At the suggestion by cable from THE INDEPENDENT to look up the Rear-Admiral's record, I secured a warm letter of introduction to Mrs. Uryu, who freely gave me every information about her husband and herself. And since they were educated in the United States—he at the Naval Academy at Annapolis, she at Vassar—and as they both studied also in New Haven, their numerous friends in America will be glad to hear of them through THE INDEPENDENT.

Just thirty-three years ago Mrs. Uryu, then Miss Masuda, was sent by the Government to be educated in the States. On the same steamer were four other girls, one of whom is Marchioness Ovama, and another is Miss Ume Tsuda,

Russian Cathedral at Tokyo—Interior

honored by Queen Victoria as well as by her own noble Empress. What these three women have done for Japan will some day make a splendid story. I will only say that Miss Masuda was ten years in America, at first in the family of Dr. J. S. C. Abbott, of Fair Haven, Conn. After graduation at Vassar she returned to Japan twenty-three years ago, and for twenty years was a teacher in the Girls' Higher Normal School in Tokyo, besides teaching music in the Tokyo Academy of Music for ten years. Yet she is the mother of seven children and grandmother of one—a happy Christian home, one of the best fruits of our great Republic to receptive and appreciative Japan.

On the same steamer that carried these girls to San Francisco were ninety-one young men sent by the Government to study. Ito, now Marquis, and the foremost statesman of the East; Okubo, afterward assassinated in Tokyo; Kaneko Kentaro, who has just been sent on a friendly mission of information to the people of the United States, were among that celebrated crowd of ninety-six that individually and collectively have had such a powerful influence upon the rapid and substantial progress of this great nation.

Rear-Admiral Uryu went four years later. When a lad of twelve he was sent to Kanazawa to study English. At fourteen he entered the Naval Academy at Tokyo, but before graduation he was sent to the United States in 1875, and preparatory to entering the Annapolis Academy he studied two or three years in and around New Haven, where he met Miss Masuda. He managed to spend his short vacations in Washington, but he utilized the long summer vacations by going to the mountains or seashore, whichever way Miss Masuda happened to be going. On his return to Japan he was rapidly promoted, and was absent from home to such an extent that his children regarded him as a family friend until these last three years, during which for the most part he has been on staff duty in the Capital. He was four years naval attaché in Paris, and after commanding one and another battle ship was made Rear-Admiral. About this time he met with a misfortune that came within an ace of cutting short his public career. While commanding the battle ship "Fuso" he collided in one of the naval maneuvers. In his round robin to his Annapolis classmates he says: "I appeared before the court-martial and was punished pretty severely." No matter what the punishment was, the authorities evidently saw a future in him and shortly placed him in command of the then largest battle ship of the navy, "Yashima." That was four years ago. For services rendered in connection with the relief of Pekin he received the immediate recognition of his Emperor in a high grade of that Order which is the hope of every upper official in the army and navy—second grade of the Rising Sun. When one division of Japan's fleet gained that swift victory over the Russian ship at Chemulpo, that Russia calls "treacherous and in violation of international law," it was Rear-Admiral Uryu that did it. It was a brilliant beginning of rapid naval movements that have crippled Russia's power in Eastern waters beyond recovery.

What will now happen on land? Russia indignantly proclaims that she will strike a blow worthy of her greatness, one that shall be a terrible punishment to this lawless and heathen upstart of the East. But without a navy how can she strike any crushing blow? The impression prevails here in foreign as well as in native circles that the crushing blows are more likely to fall on Russia's army as well as on her navy. There is no Japanese voice heard that does not believe that Port Arthur will have one more retrocession—into Japan's hands. No Russian army can safely enter Northern Korea. The more Russian troops are massed in Liaotung Peninsula, around Mukden and behind Vladivostok, the better it pleases Japan. For there is no help from the ocean side, and only one line across wide Siberia. When the break comes in that line—as it will come—the greater Russia's army this side, the greater her humiliation.

In foreign circles that know, this is regarded as highly probable. It is certain enough that soon Saghalien, with its rich fisheries, that Russia quietly appropriated in the days of Japan's weakness, will again be a part of Japan's map. Her flag will probably fly over the hights of Vladivostok and her ships will float at

peace in that deep beautiful harbor. Russia will lose all that she has, and all that she dreams of securing. The shores of the great inland Japan Sea will be wholly Japan's or under her protectorate. Such is the deep oath Japan has taken, and in truth it may be expected.

Let us hope that this will be the speedy result. For Japan fights for international righteousness and for open doors of knowledge, religion and commerce, while Russia's victory would mean the extension of despotism, ignorance and exclusion.

SENDAI, JAPAN.

The Bulgarian Army and the Threatened War

BY F. W. VON HERBERT

[Captain von Herbert fought under Edhem Pasha while he was scarcely more than a boy in the campaign of '77 and '78; and his book on "The Defense of Plevna" has been translated into eight languages. He was in the Chilean war and the Boer war, and has now gone to the Balkans in order to take part in the coming war between Turkey and Bulgaria, should it be opened, as many expect, in May.—EDITOR.]

THE following four points must be borne in mind by him who wishes to form an opinion on the Bulgarian Army of to-day. They are to be considered as undebatable presuppositions, upon which, and upon which only, a sound judgment can be based.

Firstly.—The Army is young—25 years—and the Bulgarians have not borne arms for nearly five centuries.

Secondly.—The nation has not fought for her independence, but has had it won for her by others.

Thirdly.—The Army was organized by Russians, on Russian models, and in Russian interests.

Fourthly.—The nation has inherited from Turkey qualities which are in conflict with the conditions which Russia has superimposed.

The Army of Bulgaria is obtained by universal manhood service, after the ordinary European models, to which also Roumania and Servia adhere. Every male who is a Bulgarian by birth, and is physically able to carry arms, is liable to twenty-five years' military service, commencing with the twentieth year of his life in peace time, with the eighteenth in time of war. The infantry serve two years with the colors, the other arms three years. Bulgaria has the German institution called "one-year volunteers;" this is a misnomer, but it is of universal use, and a better term has not yet been invented. Young men who pass an educational test, serve one year with the colors and enjoy certain privileges while so doing. No exceptions are made in favor of Turks, or Jews, or men of Roumanian or Servian parentage, as is done in Turkey, where military service is made subject to religion.

The Army is divided into three categories: The Active Army, with its own Reserve; The Reserve Army, and the Militia. The first is permanent, even in peace (but not its Reserve); the second has permanent cadres (organization of officers as nucleus); the Militia has no cadres, and no organization, and is the weak point of the Bulgarian system.

The infantry man's twenty-five years of liability to service are apportioned as follows: Colors, 2; Active Army Reserve, 8; Reserve, 7; Militia, 8; total, 25. For the other arms the figures are: 3, 6, 7, 9; total, 25. The privates of all arms receive a pay of one franc per month.

Officers are obtained by education and examination at the Military College in Sofia, which is fully up to the highest modern standards. The new building is an imposing architectural feature of the capital. The course lasts three and a half to four years; age of entrance is

from sixteen to twenty-one years. There is a separate three years' staff course, but not a separate establishment. Successful staff candidates are sent for a year to Russia, Austria, Italy, Germany or Belgium.

The Corps of Reserve Officers is recruited from the one year's volunteers, by means of an examination. It is, to my mind, one of the best and hopeful features of the system. Sergeant-majors with ten years' service in the Active Army may acquire commissions in the Reserve.

Military service is popular with all classes. It is to be noted that the Turkish subjects make excellent Bulgarian soldiers. The Army is the pride of the nation, but it is not foolishly idolized as is the Army in Roumania. There is a sturdy, non-ostentatious patriotism, and a keen desire to learn, and these qualities enable the leaders to obtain excellent results with the material which the manhood of the nation provides. These results are all the more surprising and creditable, as the standard of intelligence is low—the lowest of any civilized nation which I am acquainted.

The following table "gives to think":

	Turkey.	Roumania.	Bulgaria.	Servia.	Montenegro.
Population—Millions	24	6	3½	2½	¼
Army—Peace	220,000	130,000	48,000	20,000	2,000
Army—War	1,200,000	200,000	300,000	310,000	40,000
Liability to service—Years	20	25	25	24	44
Military expenditure in normal times	$35,000,000	$10,000,000	$4,500,000	$3,500,000	$125,000
Cost per man per annum, war strength	$29	$50	$15	$11.25	88
Proportion of men at war strength to 100 population	5	3.33	8.57	12.40	16

A comparison of the figures in this table is not easy, for in the case of Turkey, Bulgaria and Servia, the war strength includes certain Landsturm formations of doubtful value, even of doubtful existence (the Mustafiz of the former, the Militia of the second, the Second Ban Militia of the latter), whereas the figure for Roumania gives merely the Army actually available for active operations. I have no means of ascertaining the additional force which Roumania could raise in a *levée en masse*, but I should imagine that 50,000 able and trained, or partially trained, men would be forthcoming. This brings her total war strength up to 250,000, and the cost down to $40 per annum per man.

Even with this modification, the Roumanian Army is the most expensive of the four under consideration, and the Servian the cheapest. The Bulgarian is but little more expensive than the Servian. But here we have to remember that while the Administration of Bulgaria and Servia is fairly honest, that of Turkey and Roumania is not. The actual sum squandered in corruption and mismanagement is undoubtedly greater in Turkey than in Roumania, but it is my belief that the proportion is heavier in the latter.

As regards the relationship between population and Army at war strength, here also Roumania occupies the worst position (the percentage becomes 4.17, if the increase of 50,000 men mentioned above is taken into consideration), while Servia has the best, and Bulgaria is a good second. In judging the figures for Turkey it is to be remembered that the Ottoman Empire will have none but Mohammedan soldiers.

Applying the conclusions to be drawn from this table to Bulgaria, we arrive at the following results:

Firstly, as regards money, Bulgaria works economically and honestly, and obtains excellent results for her outlay, almost the best obtainable, taking the Servian as the maximum.

Secondly, as regards men, 8½ per cent. of the population are available for war, which is not up to the Servian standard, but better than the Turkish, and much better than the Roumanian, achievements.

Thirdly, Bulgaria is a match for any of her neighbors, except Turkey.

And this last statement holds good, even if we deduct from the Turkish war strength 200,000 for untrained Mustafiz troops, and another 250,000 for troops trained, but not available for operations in Europe, by reasons of distance and lack of transport.

This brings the Turkish force down to 750,000, and from this one may deduct 100,000 for troops worn out by the long continued operations against the Macedonian rebels, who would have to be replaced by fresh men. The result, 650,000, is, to the best of my belief, the strength which Turkey would bring to bear on Bulgaria, and that is more than double the strength of the Bulgarian forces, even if the Principality succeeds in calling out, organizing, and rendering fit for the field, the whole of her Militia. Is, then, the average Bulgarian soldier worth more than two average Turkish soldiers?

The infantry is armed with the Austrian and Männlicher rifle, which has a magazine holding five cartridges, and is loaded by means of a clip. The breech action is of the "straight bolt" description, for which its Austrian inventors claim quickness and ease of loading. The rifle is light (8 pounds without bayonet) and handy, and of excellent make and finish. The soldier carries 150 rounds on his person (pouches, bandolier, and valise); 130 rounds per rifle are carried in the ammunition wagons, and by mules; total, 280 per man.

The new Turkish Mauser rifle weighs 8 pounds 9 ounces, without bayonet. The soldier carries 100 rounds on his person, and 400 per rifle are carried in the battalion transport carts; total, 500 per man.

The Bulgarian musketry regulations are a model of what musketry regulations ought to be, and the standard of marksmanship is high. In spite of the fact that the foot soldier receives only 21 months' practical training with the colors (three months in two years are deducted for furlough during harvest time), and that an unusually great portion of his working time is devoted to shooting, he is smart on parade. The guard-changing which I saw at the Palace (a regular Sunday ceremony—a company is on duty for one week), was as well done as anything I have seen in Germany. And the Bulgarian can march—the Slivnitza campaign has proved it. The Plevna regiment did 60 miles in 26 hours, through snow and slush, and this is but one instance of many that could be mentioned.

Much of the equipment is of the cheap and nasty order, for Bulgaria is a desperately poor country. The boots, in particular, are bad, and are also deficient in quantity. But the soldier is at liberty to wear, on the march, the national rawhide sandals, with bandages round foot and leg, and better footgear for hard work does not exist. On a route march nobody wears the doubtful regulation boots.

There is a serious shortage in the reserve stock of small arms ammunition, and feverish attempts are now made to replenish the store.

The field artillery is armed with a Krupp gun of the 1875 pattern, but the new howitzer regiment of five batteries has Krupp guns of 1894.

The cavalry is the weak spot. Bulgaria is not a nation of horsemen; few of her sons have either liking or aptitude for horsemanship. The native race of horses has deteriorated during the last thirty years, as has also the Roumanian, and in both countries the reasons are undiscoverable. Both nations are making attempts to improve the breed by the importation of Arab blood; so far Bulgaria has been more successful than her rival. The bulk of her military horses is procured from Hungary, but there is a serious deficiency, particularly in the artillery and the train; indeed, the latter will have to rely chiefly on the national wooden ox-carts.

The Bulgarians are a sober nation; drunkenness is almost unknown. The colonel of a regiment I visited has had two cases in five years. The young men do not smoke, with few exceptions a pipe is hardly ever seen, and the vice of excessive cigarette indulgence is confined to the alien town population. There being no smoking and no drinking, there is no spitting. And as the craving for alcohol does not exist, the crime which is essentially the British soldier's crime, of selling his blankets, boots, etc., for the purpose of obtaining beer, is unknown.

I have had facilities to observe the recruits, who have been called up this year a month before the usual time. I saw them when they joined, dirty, travel-stained, expectant, cheerful! I saw them at that important function, the initial bath in the river (which to many was apparently also the first bath of their lives); I saw them two hours after they had been clothed, and I have studied them when they were being taught.

The recruit is docile, quiet, well behaved, willing to learn, anxious to please, but he is incredibly stupid, and cleanliness is a new experience to him. He has to be taught everything, from washing his face to sweeping a room, from making his bed to cleaning a coffee-pot. They have an excellent system here. To every recruit is allotted for the first week one old soldier, who teaches him the domestic virtues. Sometimes, in emergencies, an old soldier will have two pupils, but never more than two. Within the last few days they have brought to Sofia, from small stations where no recruits have joined, bodies of older men, so as to be able to carry out the principle of one teacher, one pupil. When the trained man has finished with the youngster, has taught him how to behave in the barrack-room, in the square, and in the street, has knocked a few elementary notions of cleanliness into him, the drill instructor takes him in hand.

In education the country has advanced by leaps and bounds. The following figures were given to me by a colonel: In 1888 there were 1,700 illiterates in a certain contingent of recruits numbering 2,000, or 85 per cent. To-day the proportion is 18 per 1,000. Schools are good and numerous; what is wanted is not so much education as intelligence.

Religious instruction is scrupulously given; as regards the recruits, great care is taken that attendance is regular, and the tuition appropriate. The nation, as a whole, is not religious, and the priests of the Bulgarian Church (which is now divorced from the Greek) have neither the intelligence nor the education to command success, altho their personal character stands higher than it did in Turkish times; then many "popes" were steeped in corruption, intrigue, vice and every other iniquity. The soldiers of all denominations receive spiritual guidance. The Jews have two classes of rabbis, the "Spaniole" and the "Poli." So conscientiously is the principle carried out that, if there be but one Turk among the the recruits of a regiment, a Koja (Mohammedan priest of the lower grade) is procured for him.

The Bulgarian officer may best be described as a "plodder." He has not a quarter of the intelligence of that incorrigible *flaneur,* his Roumanian comrade, but he works ten times as hard. He works his men too hard, according to some respect-deserving opinions. I made a note of the time-table, for one day, of the Plevna regiment: Shooting, 6 to 8; breakfast and cleaning, 8 to 9; fatigue work on the railway (where there is a military stores shed), 9 to 11.30; dinner and rest, 11.30 to 2; drill, 2 to 5; tea, 5 to 6; indoor instruction, 6 to 7.30. The teaching is done at high pressure, for the soldier has only twenty-one months in which to learn everything.

Democratic Bulgaria knows not the difference between a gentleman and a man who is not a gentleman because his father keeps a shop, and in consequence all classes join the Military College to become officers, education and good conduct being the only qualifications. Most officers live comfortably on their pay. Home produce is ridiculously cheap, but all imported stuff is dear. For forty centimes you can buy a large bottle of excellent native wine, but Austrian beer is forty centimes the glass. A franc and a half will purchase a good leg of mutton, but I had to pay three francs for a small tin of meat extract. A lieutenant receives $400, a junior captain $600 per annum, but a general has only $2,400.

The number of officers actually serving falls short of the requirements. There were last year only 1,800 officers on the active list, the peace strength on paper being nearly 3,000. And probably this year the figures will be even more unfavorable, for many have left the service to join the Macedonian rebels.

Both the deficiency of numbers and the extreme youth of the senior ranks are unavoidable defects in a young army, which time will remedy.

The Corps of Reserve Officers numbers now nearly 2,000, and is steadily increasing. It is composed of lawyers, merchants, clerks, farmers, teachers, officials, shopkeepers. These form the best part of the civilian population, and what they lack in knowledge of drill and routine they make up in intelligence, keenness and patriotism. As it so often happens, the professional is apt to sneer at the amateur (does not our regular officer scoff at the Militia?), but the latter, being more of a reader, is frequently superior to the other in the science of the military calling. To those who know

and think, the Reserve officer is the hope and trust in the coming war. Did not our Militia save the Empire from collapse in 1900?

The basis of all theoretical teaching is German science and German thought. The drill is Russian. The institution of the mess is not known in Bulgaria. The married officer lives in a hired house, the unmarried in lodgings; both have their meals at home; they go to barracks in the morning and return in the evening, much as a merchant goes to his city office. The officers of the garrison of Sofia have a handsome club, which, however, does not correspond to our mess, or to the German "Casino." Regulations, interior economy and general arrangements are after the model of the French *cercle*. The *camaraderie*, friendship, affection, of the British mess are unknown to the Bulgarian officers. So is ragging.

A few data regarding the much mixed population of the Principality will help the reader to form an independent judgment.

The official census divides the inhabitants into Christians (2,700,000), Mohammedans (650,000), Jews (30,000), and "others" (1,000); total, 3,660,000. Round figures are given, as the probable increase since 1893 has been taken into consideration.

The "others" are probably such gipsies as openly confess to some sort of fetish worship. The majority of the nomadic gipsies are, at heart, heathens; but for official purposes they style themselves Christians or Mohammedans, according to the country they happen to stay in. More than half of the Balkan gipsies are settlers, and all towns have gipsy quarters. There are 50,000 gipsies in Bulgaria, of whom 20,000 are nomads.

The Jews are composed of two distinct classes. The Spanioles, descended from Spanish and Portuguese fugitives, and the "Poles," in which name are included German, Polish, Austrian, Hungarian and Russian Israelites. The former are prosperous, educated and respected; they are mostly merchants, bankers, money-changers, or shopkeepers; their language is a corrupt Spanish, written with Hebrew characters; many are excellent linguists. The Poles are the pariahs of Bulgaria; they are abjectly poor, and abjectly miserly, dirty, verminous, ignorant and generally beastly; the best among them are petty tradesmen and second-hand dealers; the majority are hawkers and beggars; their language is a hideous mixture of German, Polish, Hebrew and Turkish, the "Yiddish" of the East.

The "Mohammedans" of the census are, of course, the Turks who chose to remain in Bulgaria when the Principality shook off the Ottoman yoke. They are quiet, well-behaved and fairly prosperous, and they keep clear of politics. They are liked as neighbors and fellow-citizens, and Bulgaria has recently offered facilities to former Sofia, Plevna, or Widdin Turks, who wish to return to their old homes. The term "Mohammedans" includes also a very peculiar tribe, the Pomakes, or renegade Bulgarians, of whom there are 150,000, and whose principal habitation is the district between Plevna and Lovdcha. They partake of the characteristic of all renegades, inasmuch as they are more fanatical than the wildest Mohammedans. Their conversion dates from the sixteenth century. At one time—not so many years ago—their name stank in Europe, for all the notorious Balkan brigands have been Pomakes. A small branch of this tribe dwells in the Rhodopé mountains; these are nomadic and when they have committed robberies on Bulgarian territory, they cross the frontier into Turkey, and *vice versa*. They are still brigands, as the case of Miss Stone has proved. The Pomakes speak Bulgarian, but most of them know Turkish.

The 2,700,000 Christians of Bulgaria include:

Greeks, 60,000, in all the larger towns: traders, brokers, money-changers.

Armenians, 8,000, in the towns.

Roumanians, 60,000, in the northwestern corner, around Widdin; here there are whole districts where nothing but Roumanian is spoken.

Servians, 6,000, along the frontier; many of these are Roman Catholics.

There are also several thousands of Circassians (locally called "Tatars"), the sons of the notorious Bashi Bazoacks of 1875 and 1876; and 6,000 foreigners, mostly Germans.

Of this heterogeneous material the Bulgarian Army is composed.

The overwhelming majority of the population is agricultural. Commerce is in the hands of the foreigners; retail trade in those of the Jews, Greeks and Armenians. Manufacture is insignificant, but there is some cottage industry (weaving, embroidery, lace, pottery, silver-filagree). There is no mining, in spite of the hidden wealth of the Balkans. For enterprise money is lacking. The climate is glorious, the soil magnificent, the produce of any country and any latitude will grow here almost without care.

The Bulgarians proper are, contrary to the general opinion, not Slavs, except in language. They are of Ugrian descent, a branch of the Huns; they are, therefore, related to the Turks and the Magyars, not to the Russians. In the tenth century they adopted Christianity, the Slav language and the Cyrillian alphabet.

In giving the relative strength of the Turkish and Bulgarian forces, I proved that if the Bulgarian soldier wishes to hold his own against the Turk he must be worth more than two Turkish soldiers; if he wishes to beat him, he must be worth at least three Turks. I asked: Is the military value of one Bulgarian soldier really equal to that of two or three Turkish?

This question may be propounded in another shape.

That the Turk was a match for three to four Russians in the year of war 1877 is amply proved by the records of history. There appears to have been no deterioration in 1897, but here the opponent was so contemptible that it is wiser to leave this ludicrous campaign out of the calculation. The question may, therefore, assume the following form: Has the Turkish nation, in a quarter of a century, degenerated to such an extent that the military value of her forces is now a sixth, or a ninth, of what it was?

One may reasonably ask, wherein lies this enormous (fancied) superiority of the quality of the Bulgarian forces? The great majority of the Bulgarian people desire war; they are asking for it daily; and they imagine that they possess this superiority.

It can only be in any of the following: Physique, intelligence, education, military training, *morale,* in which latter I include courage, discipline, endurance, patriotism, the sense of duty and of sacrifice, and a belief in the righteousness of the cause.

The Bulgarian physique is good, but not better than the Turkish. In intelligence the Turk stands immeasurably higher than his opponent. Elementary education—none other concerns us here—is on about the same level in the two countries. Of the training of the Turkish soldier I cannot speak at present, as I have not seen him for many years. And as regards *morale,* no doubt the discipline in the Bulgarian Army is excellent; no doubt the Bulgar is brave and enduring; no doubt there is at present a strong sense of patriotism and duty, a keen desire of sacrifice, an overwhelming belief in the cause; but has not the Turk, when called upon, displayed all these qualities in an extraordinarily high degree, the highest almost known in modern history?

One word regarding the future of the Bulgarian Army. When the Macedonian has ceased to trouble and the Turk is at rest the nation will gradually drift toward the Swiss ideal—not to its complete realization, no standing army and all militia, but to some stage similar to that at which Montenegro has arrived; a very small but highly efficient force actually under arms, and a large, well trained reserve, comprising practically the whole able manhood of the nation. Servia is advancing along that line; and, in truth, this is the only practicable and permanent solution of the military question for a small, poor, agricultural State. And there are indications that thinking men, even in powerful and rich countries, are coming to the conclusion that the army of the future will be the Militia, Reserve or Landwehr, which alone can provide efficiency without loss of labor, without waste of wealth-producing power.

SOFIA, BULGARIA.

King Edward VII and His Parliament

BY JUSTIN M'CARTHY

JUST now the air is filled for us here in England with all manner of rumors about difficulties arising between King Edward and some of his Ministers. The general effect of all that one can hear from anything like authoritative and trustworthy sources is that the King has entered upon a career of genuine and high-minded statesmanship, and is doing his best to make his reign memorable by enlightened and upright measures. Every evidence on which we can place any reliance shows that he is determined that full justice shall be done to the rightful claims of Ireland, and, indeed, this was to be seen from the very moment when he appointed Sir Anthony MacDonnell Chief Secretary to the Lord Lieutenant of Ireland, a position which is practically the chief working place in the Irish Government. The King, as every one believes, used his influence from the moment when he came to the throne in order to bring the calamitous South African war to an end, and it is understood that he is wholly opposed to the policy which would introduce Chinese slavery into the industries of the Transvaal for the benefit of the wealthy mine owners. But the great difficulty consists in the fact that His Majesty's Ministers are in what seems to be hopeless disagreement among themselves on all the leading principles of policy and government. Some of the most enlightened statesmen, who until lately held a place in the administration, have withdrawn from it because they could not stand the principles and the practices of Mr. Chamberlain, who is now himself no longer a member of the Government. There are, however, still in the Ministry some men who would even out-Chamberlain Chamberlain himself in the worst parts of his policy, and these men are under the impression that they have a strong support in the Conservative party throughout the country.

No one who knows Mr. Arthur Balfour can believe that he has any sympathy whatever with some of the principles of Mr. Chamberlain, or that he felt any personal approval of the policy which forced on and carried through the South African War. But Mr. Balfour has for a long time been too much out of health to throw his whole soul and energy into any political struggle. He was for a considerable time compelled to absent himself altogether from the House of Commons, and when he did return there it soon became clear that he had not the physical energy needed for the conduct of affairs during so serious and perplexing a crisis. Every day we hear reports to the effect that his health threatens again to break down altogether and that he may be expected before long to announce his intention of withdrawing absolutely from public life. We seem to live, in fact, at a time when anything may be expected, and when to-day's condition of things may be succeeded by something bewilderingly different to-morrow.

The one great question which men are asking each other is whether His Majesty's Ministers intend to fight the session on to the end, or whether they will decide to dissolve Parliament immediately and take the verdict of the country by means of a General Election. If there had been at the opening of the session a very strong and energetic Liberal Party in opposition, I think it is almost certain that such a course could have been forced upon the Government, and with every hope that the result of the General Election would be the return of the Liberal Party to power. But for some reason or other the Liberal opposition has not shown any strength or any decision during the present session or the last, and the work of genuine and vigorous opposition has been left altogether in the hands of Mr. John Redmond and his gallant and united band of Irish Nationalist members. One fact at least may be taken as certain that, however the movements of Parliament since King Edward came to the throne may have affected the Conservative Government or the Liberal opposition, they have enabled the Irish Nationalist Party to raise itself to a more

THE LATE CANON AINGER

commanding position in the House of Commons than it ever held since Parnell reached the zenith of his power. While writing this article I have actually received the news that Mr. Redmond has in the debate on the estimates for Irish Education inflicted a positive defeat on the Government. He carried a motion for a reduction in one of the estimates by a majority of 11. The Government may affect to think lightly of this defeat as a mere casual incident, but every cool observer must know that it carries with it something like a death warning.

The news just now is that Chamberlain is returning from Egypt in an improved condition of health, and if he does really come back to the House of Commons at once, it is certain that he will add new life and new interest to the struggles of the wrecked and wrecking parties. From the point of view of the unconcerned observer I, at least, should be very glad of Chamberlain's return, because we should then begin to have some clearer understanding as to what the rival Conservative parties were expected to do. It has to be said for Joseph Chamberlain that when he speaks he never fails to give you the clearest understanding of what he means to do at the time. I am far from suggesting that any policy which Mr. Chamberlain may describe as his policy this day might be safely regarded as his probable policy for this day twelve months, but what he intends to do at the moment he can always set forth in language which the dullest cannot fail to understand. Our present difficulty is that many of the leading men on both sides of the House do not seem to have made up their minds as to what course they intend to pursue; or, if they have thus made up their minds, are not able to put their resolve into words which the ordinary mortal can understand. When Joseph Chamberlain speaks we shall at all events fully know what he means us to understand.

The public life of Great Britain will be much the poorer by the withdrawal from it of Sir William Vernon Harcourt. Sir William is the last of that group of really great politicians to whom belonged Gladstone and Disraeli, Bright and Cobden, and the eloquent Lord Derby, the "Rupert of debate." I can well remember all these men, and it is not too much to say that Sir William Harcourt fairly deserves to be ranked among them. If he was not one of the greatest among the group, his career as a statesman and a parliamentary debater must always be associated with its fame. Harcourt won distinction, as did Gladstone and Disraeli, in other fields besides that of political warfare. He was eminent as a legal advocate and as a writer before he entered the House of Commons. He won high reputation by an important series of essays which appeared in the *Times* under the signature of "Historicus," essays which, afterward published in a volume, went through many editions and found readers all over the world, and he was one of the most brilliant writers in the *Saturday Review* during that periodical's earliest and most brilliant days. I followed with interest the greater part of his career in the House of Commons, and was well acquainted with him during the many years when I was entitled to occupy a seat there. He was in every sense a great Parliamentary debater. He could hardly claim to be regarded as an orator in the highest sense of the word—an orator, for example, of the order of Gladstone and Bright, for he wanted something of that gift of

imagination which is needed for the noblest style of eloquence, and in this quality he resembled perhaps Disraeli rather than Gladstone or Bright. But as a debater he has not had for many years a superior and has hardly, indeed, had an equal in the House of Commons. His appearance, his manner and his voice were impressive; he was ever quick with reply and retort; he always made himself thoroughly a master of his subject, and he had a ready and happy gift of sarcasm which he sometimes used as unsparingly as Disraeli himself could have done. Then, he was unquestionably a statesman with an especial gift for finance, and his celebrated "Death Duties" Budget brought in a few years ago, when he was Chancellor of the Exchequer, was an event in the history of English financial administration. I have heard many men complain that his manner was overbearing and that he was difficult to approach. I can only say that I had ample opportunities of becoming acquainted with his ways and his deportment in the House, and I never found him anything but fair-minded, genial and ready to give his fullest attention to every reasonable suggestion. The Irish National Party, of which I was a member, was often at one time brought into keen antagonism with the Liberal administrations to which Sir William Harcourt belonged, and we always found that even when our political attitude was most antagonistic he was ever ready to give a full and fair hearing to any representations which we had to make where the especial interests of our country were concerned.

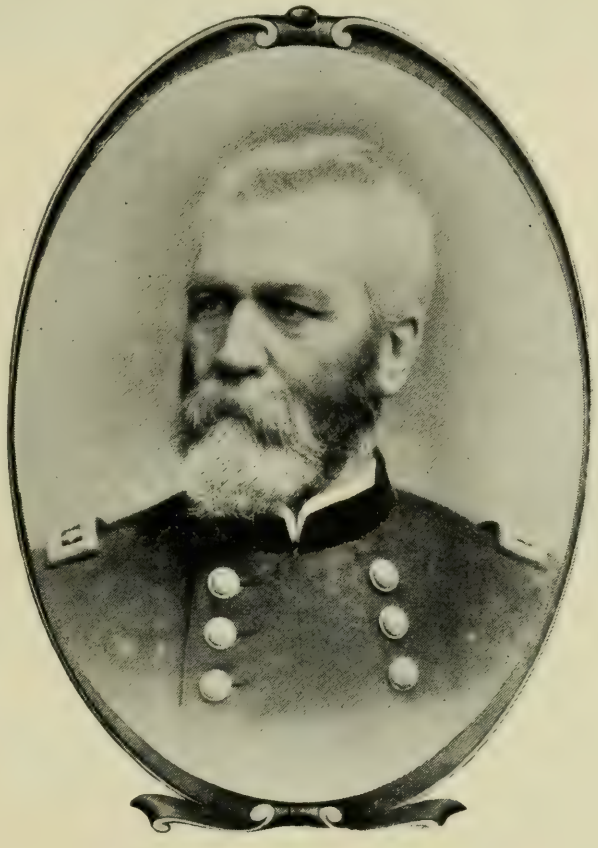
For myself I can only say that I knew him privately as well as publicly, and that I never received anything at his hands but courtesy, kindness and friendship. He always seemed so full of vital power and energy, so unlike a man conscious that he is bending under the weight of years, that it greatly surprised me to hear of his positive resolve to withdraw altogether from public life. "Happy the man," says Thackeray, "who quits the field in time and yields his broken sword to Fate, the conqueror, with a resigned and cheerful heart." But, then, Harcourt's sword was not broken, and, so far as any one could judge, he is just as capable of wielding it now with strength and skill as he was in any of his brilliant fighting days. My American readers will remember that Sir William Harcourt married as his second wife the daughter of your famous historian, Motley. His son, Lewis Vernon Harcourt, a man of high capacity and culture, who has just been elected to a seat in the House of Commons, is also married to an American wife. It seems to me that the House of Commons could never look like the same place after Sir William Harcourt's retirement that it used to be when his stately presence was conspicuous there.

English letters and scholarship have sustained a severe loss since I last wrote to THE INDEPENDENT by the death of Leslie Stephen. Indeed, it might almost be said that a whole school or generation of our literature came to the close of its work when this eminent man passed away from among us. Leslie Stephen came of a highly distinguished and cultured family. His father and brother won for themselves fame in the legal profession and also made for themselves a mark in literature. Leslie Stephen was one of the foremost, most versatile and brilliant of modern English essayists, and he was for many years editor of the *Cornhill Magazine,* the publication which began its career under the leadership of Thackeray. Leslie Stephen had closer

THE LATE LESLIE STEPHEN

associations with Thackeray than the succession to the editorial place, for he married one of Thrackeray's two daughters. This lady died some years after her marriage. Her sister, Mrs. Ritchie, is still among us; is one of our most charming and gifted authoresses, and has a large circle of friends among whom I hope I may have the honor of regarding myself as one. Leslie Stephen wrote for many other high class publications as well as the *Cornhill Magazine,* and his vivid style and his suffusing, never obtrusive, scholarship were a source of delight and instruction to unnumbered readers. Of late he had given himself up almost exclusively to his work in the great "Dictionary of National Biography," in the production of which he took a leading and an untiring part. He was, in fact, for a long period the chief editor of the work. He held for a time the position of lecturer on English literature at the University of Cambridge. He was not a man to be met very often in public life, and followed his own successful career without the slightest effort to make himself a conspicuous figure on platforms or in society; but none who had the good fortune to meet him in private life could ever fail to be impressed by the quiet charm of his manners. I associate him not unnaturally with the era of Thackeray, an era which may now be said to have passed entirely away into literary history.

Another man of mark has been withdrawn from our literature by the death of Canon Ainger, who, altho by profession a churchman, devoted much of his time to literary work, and is mainly remembered by many readers as an essayist, a biographer and an editor. His memoir of Charles Lamb is an invaluable contribution to our store of biography. Canon Ainger was to be met with in public much more often than Leslie Stephen, for it gave him pleasure to make an appearance at literary dinner parties and other such gatherings, and he was unquestionably a wit and humorist of the first order. I have more than once had the good luck to form one of the company on such occasions, and we all knew in advance that Canon Ainger's speech would be the event of the evening, and I may safely say that we were never disappointed. Canon Ainger was the most cordial admirer of the humors of Thomas Hood, and even went so far as to vindicate with a delightful mixture of sound common sense and sparkling wit Hood's tendency to interlard some even of his serious poems with mere puns. Ainger declares that "to hear of any ordinary man that he makes puns is properly a warning to avoid his society. For with the funny man the verbal coincidence is everything; there is nothing underlying it or beyond it. In the hands of a Hood the pun becomes an element in his fancy, humor, his ethical teaching, even in his pathos. As ordinarily experienced the pun is the irreconcilable enemy of these things. Hood saw and was the first to show that the pun might become even their handmaid." Canon Ainger was, indeed, in many of his ways, altho in not all of his views, the Sydney Smith of our modern London days.



London, England

The Feuds in the Cumberland Mountains

BY MAJOR-GENERAL O. O. HOWARD, U.S.A., RETIRED

[General Howard founded the Lincoln Memorial University at Cumberland Gap, Tenn., mentioned in this article, and is president of its Board of Trustees. It will be seen, therefore, that he has taken a very practical interest in the "mountain whites," and his frequent trips through their country have made him an authority on them and their region.—EDITOR.]

THE first time I visited Jackson, Ky., two years ago, I was made to realize more than I could without personal experience the feud spirit and something of the mischief it effects. Just then there was apparently an armed neutrality. The parties were divided about equally on the one side and on the other side of the controversy. It was difficult to get them into a common assembly without an outbreak. The institute, which has fine industrial features, was almost destitute of students. Parents outside of Jackson, far and near, were afraid to send their children. Strong men with tears deprecated the acute condition of affairs.

GENERAL O. O. HOWARD

A little later I sat at a table where there were confidential conversations and hints that something was to be done in the line of revenge. One of the guests at that table, a young man about nineteen years of age, quiet and peaceful in appearance, was Curtis Jett, the very young man who is now under conviction for having shot Marcum in the city of Jackson.

I asked a good woman who knew him what she thought of him. This was at my second visit after he had been arrested. She said he was a very quiet man and never had killed anybody except when under the influence of drink, and then had shot only two or three men.

While this feud spirit is recognizable, yet it does not appear throughout the mountain country except when there is some occasion to bring it out, and then whisky always performs its part. For example, after one of our meetings in a small village near the railroad, just as the congregation was leaving the large tent of worship, two men came riding along on the same horse. One, half intoxicated, slipped off behind the horse and pulled out his revolver. He said he was going to shoot Will ——. The women and children ran and screamed, and for a time there was a social ferment very much as occurred in war time, when skirmishers from both sides came into a village. Several men quieted the belligerent and got him away; then the terror ceased. Had he found Will —— doubtless he would have emptied his revolver.

It is difficult for most people to take

THE WHOLE CUMBERLAND GAP AND VILLAGE ENVIRONS

in the geography of what are called the "Cumberland Mountains," or the Appalachian Ranges. So far as I have observed, and I have of late made two extensive journeys on horseback through this rough country, there is not distinctly visible from any quarter any regularly defined range.

Starting from Richmond, Ky., not far from Berea College in the Blue Grass region, and passing southward I found rough shaggy mountains, more or less elevated, and narrow valleys, and following on directly south to Knoxville, a distance of two hundred miles, there was no breadth of country that I would call level; no prairie. It is all mountain and valley. Again, I left Wilmore, Ky., near Lexington, and ran up to Jackson, then passed through several counties such as Lee, Perry, Leslie, Bell and Harlan in Kentucky, and Claiborne, Tennessee, a distance of one hundred and fifty miles, all distinctly mountainous. The three forks of the Kentucky River course through narrow valleys, and little streams run into these forks all the way to the very upper reaches which are near the divide that passes from the Kentucky over into the Cumberland River. In these little valleys I found steep hillsides and very little cultivable land. Where the mountain streams flowed there were torrents in the springtime, but only gentle rivulets in the harvest season. Through the highest range, the divide between Kentucky and Tennessee, is Cumberland Gap. Make that pass a center, and describe a circle with a radius of sixty miles, you thus take in a vast proportion of this very irregular mountain region.

In the vicinity of the "Gap" I have visited the villages, and those along the lines of the two railroads which have from twenty to one hundred houses, some frame and some after the old log pattern. More frame houses than log structures are seen at the railroad stations.

In this country so mapped out, which includes portions of Virginia, Tennessee and Kentucky, and touches the edge of North Carolina, there are about three hundred thousand inhabitants. The most of them live in such valleys as I have described and in homes such as those of which I send you pictures. Almost everywhere these homes are now being improved as the people gain in means and in intelligence. Off the railways, where I went, the homes were usually from half a mile to a mile apart, and they furnished an average of seven children to a family. Some of the families had

as high as from twelve to fifteen children. One Howard family, in Breathitt County in the mountains, had twenty sons and several daughters.

Away from the railroad lines, passing over a few high hills and ridges, I came to regions where the roads were too bad for wagons and where the people traveled on horseback or muleback altogether.

I found that the schools had been spreading from the county seat of each county through which I passed out into the various parts of its jurisdiction. When I was in Leslie County, for example, there was a convention of teachers, who were being examined as to their fitness to teach before being sent out, far and near, to take their places and hold schools in poor buildings, sometimes without windows, with only doors for lighting, to hold and teach their pupils as well as they could for eight or twelve weeks, according to the amount of money appropriated by the State or the county for their support. This work I saw was supervised by two Presbyterian missionaries, working harmoniously with the officials of the county.

In much of the territory through which I went there were no books and seldom did I find a newspaper of any kind. Yet the interest in behalf of the children had begun to develop. People all along my route talked about the schools. My companion in my first journey, Dr. E. O. Guerrant, of Kentucky, at the head of the Inland Mission, has sent out into the mountains and valleys a hundred teachers to a hundred different stations. In the districts held by him I usually found a store and a meeting house. I left his work when I passed the "Log College" at Squabble Creek, near the eastern border of Perry County. Hundreds of children were then flocking to that "Log College." A great number of them could not read, but the enthusiasm for knowledge among adults and little ones was great and growing. The inhabitants declared themselves willing to make any sacrifice that their children might have better advantages than they themselves had had.

It seemed extraordinary to me as I rode along to find such a vast number of people living in that mountain country. After I left Jackson, and, in fact, also later, after I had left the Log College and gone southward, I did not see one

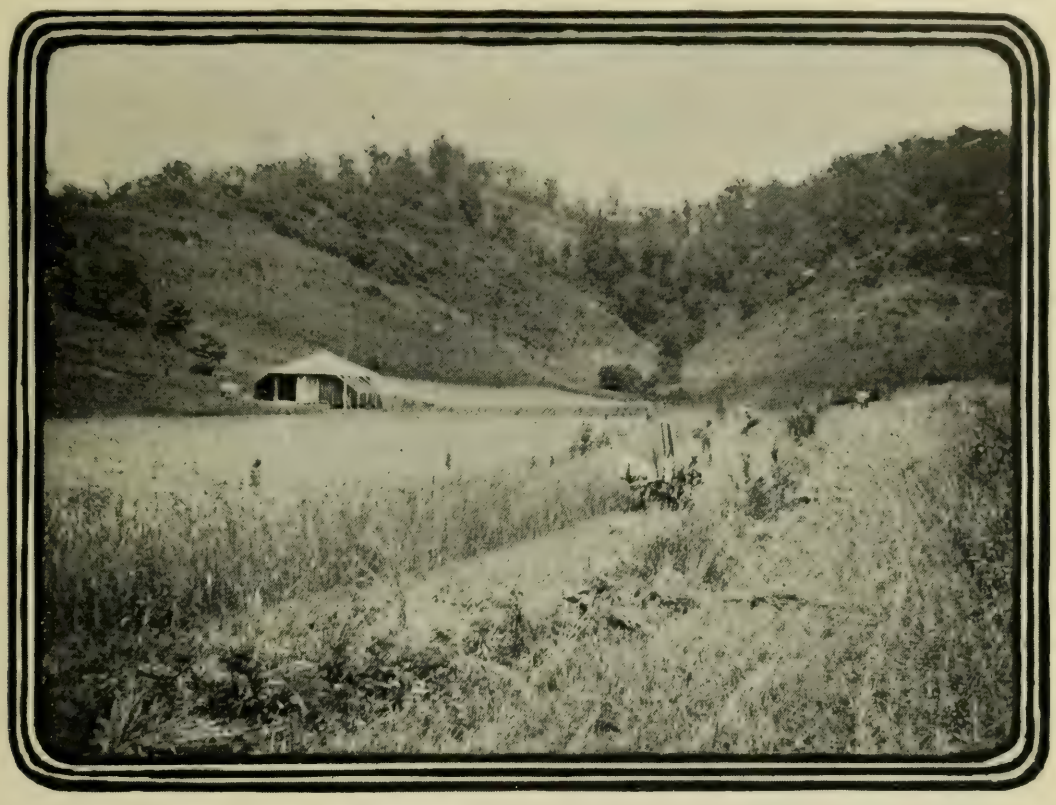
A House in the Mountains Not Far from the Lincoln Memorial University, from Which Some Pupils Have Come to the Grant-Lee Hall

black man in all that region. At Jackson I saw a small group of them, and at Pineville, where I came out of the rougher wilderness to the railroad, I found quite a large settlement of negroes. For some reason the mountain whites and the negroes have not affiliated. The mountaineers here are not idle and listless; they are an industrious, hard-working people. John Fox, Jr., in his "Little Shepherd of Kingdom Come," has magnificently drawn and painted in clear cut object lessons the difference between the Blue Grass people and the people of the mountains; only, one would infer that his Chad Buford, with kingly qualities, was an exception. My experience would warrant me in saying that vast numbers of the young men of to-day among the rugged hills have similar qualities. Of course there are a few who are found in squalor and degradation, but they are but few compared with the many who, like the children of the New England highlands. are intelligent and susceptible of any degre of culture. I met a free, bold spirit everywhere. The young men, we have noticed, with a little discipline—rather hard to give it is true—make the very best soldiers and the most enterprising students. Hawaii, Cuba and the Philippines, with all that goes with these names, have been drawing from them. They are like the Rough Riders of Roosevelt. The schools, such as they have, are alive with such spirited youth.

You ask me then, "What do they most need?" I answer at once, "Good schools and good roads." In all my educational work of thirty years I have followed this thought and epigram—namely, "You cannot keep up the lower grades in school operations without the higher." The college life was a stay and support to the common schools for many years. The academy fed the college. Not satisfied with the small number reached by higher grade institutions then existing, those educational leaders like Horace Mann led off and established the high and normal schools which for a time seemed to be hostile to the college and university. Later we have found in the West and in the South that it was wise to have object lessons set forth in what I have been pleased to call "universities," like that of Ann Arbor, Mich., or that of Minneapolis, or for the liberated race, including those of any race who are willing to share its benefits, like the Howard University at Washington. This university combined eight or ten departments; the very naming of them shows the work. "The Normal" includes the experimental classes; "The Preparatory" fits for the college course; the Medical, including pharmacy; the Law; the Commercial; the Theological, and the Industrial are the same as elsewhere. The name implies the work they do. Great stress has everywhere been laid upon the industrial features, of late greater than ever before. One reason is to satisfy those whose think that the highest training unfits a man for the trades and industries. Another reason is that working organizations have excluded apprenticeship to trades and given very little development to the industries in the line of preparatory education. This reasoning applies to the mountains.

You know that I have been working with a body of excellent men to furnish an object lesson of such a kind—of a university in the heart of the mountains which we call "Lincoln Memorial." We are straining every nerve to make the industries as nearly self-supporting as possible, and to give the young men and young women an opportunity to work out a part of their education in some one or other of those industries. Much money is needed, of course, for this work, whoever takes it up. In my longest ride over the mountains I rested a few days at this, our great university near Cumberland Gap. Its small endowment is now assured. It has sent out some fifty teachers. They have gone from the Harrow Hall, near Cumberland Gap village; and also from Grant-Lee Hall, and are proceeding from the new Avery Hall. They are not all graduates; some teach during a part of the year and attend the university during the remainder. Many of them, when they can, go back after teaching to get more knowledge and to be better trained for their work. I talked with one young lady, a bright mountain girl, who had just come back from teaching a school of twelve weeks. She had had eighty-three pupils, mostly beginners.

Other institutions besides the Lincoln



Memorial University have been doing the same thing, and I rejoice in their enterprise.

I rejoice in everything which pushes forward our work for the mountain people, and do not forget the roads. I covet large appropriations from Congress to set an example in the way of building roads. If Congress would appropriate one-fifth of the amount necessary to make a good road, conditioned upon the four-fifths being raised in a neighborhood to complete it, away from a railroad center to the county seat in the mountains, the work would be done; it would quicken industry and production all along the road. There are plenty of minerals and magnificent timber growth. Good roads would increase the efforts for schools which will be feeders to the academies, high schools and universities within reach.

" But," you say, " what has this to do with feuds? "

The sort of work that I speak of, good roads and good education, will surely cure the feud spirit! Much of that spirit comes from the present and past necessity of a head of a family protecting his family. As I was passing one creek settlement a farmer who had been arrested was being taken to the county seat for trial. He had killed one of three young scamps who had been at his home half drunk and had insulted his daughters. A neighbor riding along by my side said that this farmer would have been acquitted if he had shot the youngster the first time he came to his home. He did not shoot soon enough to suit public sentiment.

Some of the feud spirit is inherited and there is nothing that can root that out but the change of heart that comes with *bona fide* Christianity, or perhaps I had better say in a larger sense, with *bona fide* Godliness. The Jew and the Christian alike understand very well how to train children so as to crush out forever the feud spirit.

The Glen, Cumberland Gap.—Harvesting at Lincoln Memorial University

Every man of any prominence in the mountains, a prominence acquired by his physical prowess or his mental vigor, has a following of at least forty or fifty supporters. If two of these leaders get into a contest over politics, over the Union, over money matters, or over the misconduct of somebody on the one side or the other, dispute leads to blows; blows lead to the use of arms, and wherever whisky is thrown in, moonshine or other, the war is on and it will continue till one side

or the other perishes. Fortunately there is a reverence for women and children and they are spared. Yet mothers and sisters, wives and sweethearts, frequently urge on the contest. Sons are very often inspired in early childhood with a hatred or spirit of revenge which is very hard to eradicate. It will be done as it is done everywhere else by more and more of the spirit of the Master, which Mr. Lincoln so well understood when he gave such strong evidence of love not only for those with whom he came in contact but for his enemies.

BURLINGTON, VT.

The End and the Beginning

BY CHARLES BATTELL LOOMIS

AUTHOR OF "A PARTNERSHIP IN MAGIC," ETC.

WHEN a man is in good health and his business is prospering the woes of mankind do not sit so heavily upon him as to impair digestion, and that is why I walked along Broadway indifferent to what might have been going on in the minds of those who passed me. It is probable that even if I had been in bad health and my business had been going to the dogs I should not have been keenly alive to the troubles of my brothers, the average man being to a certain extent selfish.

But when I met Roswell Adams I could not help seeing that something had happened to upset him. He looked hagworn, as they say up in Connecticut, and his step, usually a springy one, had lost all its resiliency.

"Hello, Rossy, what's the matter? Been keeping late hours?"

Adams halted and shook hands and then joined me in my upward walk.

"Haven't you heard the news?" said he, in much the tone of one who might express surprise that you had not heard of the total annihilation of all Europe.

"No," said I, bracing myself for a shock.

"I'm ruined!"

"You don't say so!" said I, with genuine sympathy.

"Yes, Kimberly, I'm ruined. All the money I've been saving up for the last fifteen years is everlastingly gone through the failure of the Jefferson National, and $200 represents my entire assets."

Now Adams had been a generous liver and I was sorry for him. I could see he was hard hit.

"Surely it isn't as bad as all that, man. Perhaps you've unconsciously exaggerated it."

"No, Kimberly; I'm a ruined man. I've got to begin all over again, and I don't feel like doing it. I seem to have lost my sand. The future is as black as night. Here I am, nearly thirty, and I've been saving ever since I was a boy, and now not to have more than $200. What's $200? Here in New York it is worse than an insult. I'd like to butt my head against a wall."

Well, of course, I knew that this was not a manly way to talk; but I felt sorry for Adams just the same, and as we walked up the busy street, crowded with home-goers, I tried to encourage him with empty words, but was not very successful.

Just above Seventeenth Street I saw Joe Havens coming along with a bounding step and an amount of joy in his face that would look stupendous if expressed in figures. He was bursting with happiness, and yet what he had to be happy over I could not guess; for, if ever a man of thirty had led a life of buffeting and discouragement, Joe was the one.

He saw me as soon as I saw him, and altho he was half a block off, he began to grin and ran toward me.

He gave me a pump-handle shake, not noticing the woebegone Adams, whom he knew slightly.

" Congratulate me, old man. I'm IT. There's nobody in the world but myself and I am richer than Crœsus. I feel as if I could buy the whole of New York and then give it away for nothing. You're going to dine with me to-night at Delmonico's."

I was quite carried away by his enthusiasm and I grasped his hand again right warmly as I said, " Why, old man, there's nobody in the world I'd rather see happy than you. You've been kicked over and set up again and kicked over ever since I knew you. Is it a rich fiancée or a flyer on the Street, or a legacy? "

Havens had now noticed Adams and gave him a nod and a smile, which were returned, perfunctorily, the gloom being hard to overcome, and then we all three continued up Broadway.

" It isn't anything *quite* as good as that and yet it's better, because— Well, I've sold ' The Daltons.' "

He stopped stock still, and I had to stop also in order that I might let his words acquire meaning. If he had said he had sold the Morton House I might have understood him, but " The Daltons," New Yorker as I was, was one on me.

The ruined Adams came to my rescue. " A story? " said he, questioningly.

" Yes, sirree; it's a story that I've tried to sell for three years, and now I've sold it outright. No bothering with royalties, but I'm *paid* and I have the beautiful bills right here in my inside pocket, and you must come and dine with me. You, too, Mr. Adams, if you haven't any other engagement."

Adams seemed to have caught a little of Haven's glow, for he accepted his invitation, and I was glad to think that his stomach had not gone back on him, even if he was reduced to a paltry two hundred dollars.

We walked up town, but now the pace was swifter, for Havens was setting it. On the way up I said, " Say, Havens, what's the use of blowing in your money on Delmonico's. They don't need it, and we can have a cosier time at ——."

No, I'm not going to tell the name of the place, because if all the world knew of it, what would become of the coziness? Find it if you can, but for the present picture us turning and walking down Broadway to a certain cross street and then turning west.

All the way down Havens talked so fast and so much that Adams didn't have a chance to get in a single croak, and yet I could see he wanted to talk some more about his bad luck.

Haven's figures concerning " top crests," " bunches of happiness " and the like must have rubbed the bankrupt on the raw; but perhaps he was oblivious to it and was wondering how a man of thirty was going to face the world with but two hundred beggarly dollars between him and starvation.

When we were seated in a quiet corner of the quaint old restaurant and had eaten our cherries and the oysters were looking coldly at us, it occurred to me to ask Havens just how much of a fortune he had acquired through the sale of " The Daltons."

" Why, didn't I tell you? Two hundred dollars. *Two hundred dollars!* and they're all in my pocket. Oh, the future is pinker than any pink you ever saw in a sunset! "

I looked at Adams instinctively.

His hands dropped into his lap and he stared at Havens a minute. Havens, on his part, looked from Adams to me and then back to Adams.

" What's up? " said he, with that curious little crack that comes into his voice at times.

" Adams, it's up to you to tell Havens your awful tale of wo, but break it to him gently."

Adams looked sheepish. Then he threw his head back, his eyes acquired luster, and, reaching across the table, he indicated that he wanted to shake hands with the proud possessor of two hundred whole dollars.

" I haven't any tale of wo," said he in quite a changed voice. " Kimberly is joking. Say, I want you two to go to the theater with me to-night. They say the dramatization of Howells's ' A Hazard of New Fortunes ' is great."

Fanwood, N. J.

Oxford Old and New

BY PROFESSOR GOLDWIN SMITH, D.C.L.

[Now when so many of our young men in every State are competing for the Rhodes Scholarships, this article on Oxford by one of her famous graduates is especially interesting. Professor Goldwin Smith was Regius Professor of Modern History at Oxford, 1858-66, and is the author of "Oxford and Her Colleges." The administrators of the Oxford Fund, by refusing to admit American students until after they had completed at least the sophomore year of college work, have endeavored to avoid the disadvantages, pointed out in this article, of admitting students who were too young or too old to profit most by Oxford work.—EDITOR.]

MR. FULLEYLOVE has given us a very charming set of engravings of Oxford,* to which Mr. Edward Thomas has added a text enthusiastic and almost rapturous, yet not too much so for the taste of an old Oxonian.

Oxford, in its way, is peerless. Cambridge perhaps has some finer things of their kind to show—King's College Chapel, Trinity Quadrangle, Clare, the walk at the backs of the colleges beside the Cam. But Oxford is, far more than Cambridge, an academical and medieval city. It is so still in spite of its hideous modern suburbs and the new town which has grown up on the north.

The history of the University was strange, nor have its practical effects ceased. The foundation by Alfred is, of course, a myth, yet not, as passionate controversialists have asserted, a forgery. It is simply an instance of the general tendency to connect great institutions with great names. It was not the interpolation in Asser's Chronicle that gave birth to the legend, but the legend that gave birth to the interpolation, which, to the author, probably seemed a legitimate addition. Camden was a most respectable antiquary, and had no special motive for flattering the University. The real origin of the University was the same as that of the other universities of Europe. A company of teachers formed themselves into a guild. The University was open to all students of all nations. The students lived generally in hotels, and attended the lectures of the teachers, which were held in any available room, sometimes over a church porch. Among the rough students of those days there was much disorder. Sometimes there were fierce battles between "the nations," as the students from different countries were called. Then came the mendicant Orders, especially the Franciscans, and tried to capture the citadel of knowledge for the Church. As a home at once of academic order and of freedom from monastic influence, Walter de Merton, the Chancellor of Henry III, founded that which was really the first college. His example was followed on a larger scale by other founders, conspicuous among whom were Wykeham, the founder of New College, and Waynfleet, the founder of Magdalen. The colleges multiplying, gathering into them the students generally, and undertaking, more or less, the work of teaching in themselves, in time absorbed the University, which became a confederation of colleges, while the teaching became tutorial instead of professorial, and the professoriate withered and almost died. The teaching staff in each of the colleges was furnished by the Fellowships, elections to which had been loaded by the medieval founders with preferences in favor of their own kin, of the natives of counties in which they had an interest, or particular schools. In the Middle Ages there was little notion of diversities of intellect. It was thought that by discipline a scholar might be made out of any wood. The effect, of course, was fatal to election by merit, and consequently to competency in the teachers. Perhaps the clerical restrictions were even more noxious. In the Middle Ages all scholars were clerics, and the founders of colleges did not imagine that they were withdrawing a Fellow from secular learning by regulating

* OXFORD. *Painted by John Fulleylove, R. I. Described by Edward Thomas.* Published by A. & C. Black, London, England. [1903.] Pp. xii, 265. Sixty full-page colored illustrations. Price 20 shillings; *édition de luxe,* 40 shillings.

the time for his taking Holy Orders. But the Reformation drew a sharp line between the clerical and the secular. Consequently Oxford, the colleges having absorbed the University and the Headships and Fellowships of colleges being confined to men in Holy Orders, fell under the complete ascendancy of the clergy. Science was banished from the curriculum with all other studies not clerical; in fact, all studies except the learned languages and theology. Whatever life Oxford had was clerical, and ecclesiastical controversy was its special product and its bane. To complete the unlucky inheritance, medieval celibacy remained the condition of the Fellowships, making it impossible for a Fellow to devote himself permanently to the calling of education. In fact, the Fellows merely dallied with education as tutors of the college, while they were waiting for college livings. Religious tests, imposed in the interest of the State Church, excluded all Nonconformists and cut off the University from a large and growing section of the nation. The net result was two centuries and a half of decrepitude and torpor, broken only by the brief interlude of Puritan ascendancy under the Commonwealth. During that long period serious injury was done to the nation by the wretched state of the places of final education, or rather of juvenile dissipation, for its wealthy and governing class. Vast revenues ran to waste, or, worse than waste, supporting those college monks of whom Gibbon said that "their deep but dull potations excused the brisk intemperance of youth." The history of Oxford foundations—indeed, that of foundations generally—is a warning to benefactors not to fasten their will too tightly on posterity. Many are the instances in which a founder has thereby defeated his own object, and done more harm than good. By the result of the inquiry into the state of the colleges of Oxford and Cambridge the British Parliament was led, as it practically has been, to the adoption of the principle that only the main object of a founder shall be treated as unchangeable after the lapse of fifty years.

About the middle of the last century, in the train of a number of other reforms effected by the Liberal movement, came reform of the universities and colleges of Oxford and Cambridge. The medieval statutes were swept away; the Fellowships were opened to merit; the clerical restrictions were relaxed; the professoriate was revived; the door was opened again to science, law and history; free admission was given to non-collegiate students; the universities were united to the nation by the abolition of religious tests. A new life now pulses in the old veins. Oxford has become liberal, progressive, scientific, capable of performing for the nation its two-fold duty, education and advancement of knowledge. She thus regains the national position which she held in the time of Wycliffe with due adaptation to the Darwinian era.

Still a great difficulty remains. Still the resettlement is incomplete, nor does any one see very clearly how it is to be completed. The professoriate has been recognized anew, called into fresh activity, and better endowed. But how is the system of teaching to be withdrawn from the colleges, which have so long had it, and centered again, as it ought to be, in the University? The question arises especially with regard to the teaching of science, adequate means for which the separate colleges do not and cannot afford. The situation calls for the exercise of academical statesmanship. At present things appear to be rather in a confused state. If the newly elected Chancellor, Lord Goschen, will give his mind to the question, now that he has retired from political office, he has a worthy and pleasant field for the gentle activity of declining years.

The subject has a special interest for Americans at present in connection with the Rhodesian benefaction. I must confess that my opinion of Mr. Rhodes, and of the effect of his doings on the honor of my country, is not such as to make me greatly rejoice in seeing my University welcome his largess and make itself a momument of his fame. Besides, the main object of the scheme is apparently political; and it is not very pleasant to see education made the vehicle of political propagandism of any kind. However, setting that aside, I cannot help rather wishing that Mr. Rhodes had simply given his money to the University, which happens to be now rather in sore need of

benefactions, British millionaires not being so bountiful to universities as are their compeers in the United States. I fail clearly to see what object there is in sending an American youth of promise to complete his education in England instead of completing it in his own country. The leading universities of the United States I believe to be now fully on a par with those of England, probably with those of any country in Europe. The American universities, thanks to the increasing liberality of benefactors, are drawing to them some of the best European teaching. There is no very apparent advantage in estranging a young man from his country and imbuing him with ideas and aspirations different from those of the people among whom his life is to be spent. That there is a difference between the character of the American and that of the English student will probably be admitted by any one who has had to deal with both. The English student is more in need of discipline and more patient of it, tho he is easily managed by those who have been brought up in the same way with him and by whom his character is understood. The American student is less patient of discipline, at least, he is less accustomed to it, and he is more of a law to himself. The same *régime,* therefore, might not suit both, and in treating the American on the English plan there might possibly be some trouble. The difficulty would, of course, not be so much felt, probably not felt at all, supposing the American students were to be post-graduates, and to go to Oxford only for a post-graduate course. But this evidently was not the object of Cecil Rhodes, who wanted to have the character and habits of youths formed on his own model, which was in fact identical with President Roosevelt's "strenuous life." Nor, owing to the circumstances above stated, is the University of Oxford in a very satisfactory condition for furnishing a post-graduate course. However, good heads and willing hearts are at work and such difficulties as there are may be overcome.

TORONTO, CANADA.

Spring

BY OLIVE MONTAGU KINDERSLEY

I LISTENED as the song of Spring from the vale came ringing,
—The air was blowing soft and very low—
Birds in the branches swaying, sang of the days of maying,
And all the waiting flowers began to blow.

I hied me forth to greet fair Spring, for surely she was singing—
No other voice was half so full and clear,—
The long dark months were over—sing buttercups and clover—
And sing your tender songs to me, my dear.

I followed in the steps of Spring, those footsteps light and springing,
And still I heard her calling down below;
The land was bathed in glory—oh, listen to the story—
You heard it once, beloved, long ago.

I greeted her the Maiden Spring, whose outstretched arms were bringing
The fairest blooms of all the new-born year,—
Lilies to lay before you, roses to scatter o'er you,—
And this good world for you and me, my dear.

LONDON, ENGLAND.

Literature

Korea

THIS is the most comprehensive work of the year upon the ancient cockpit of Asia, Korea. It serves up ruggedly the history, reforms, trade, standards of morality, government, the court, debased currency, dishonest officials, arts, graces, religions, industries and what not. Altogether the facts which the author presents speak well for the future of the land.

He is a traveler who sees things worth while and is blind to the rest. "Seoul is enchanting, . . . air sweet, city neat and orderly." This is refreshing; so many visitors paint the capital as a seething sewer fit only for cattle and coolies. The gates are no longer closed at night, a rapid train reaches it from Chemulpo and trolleys traverse it. There is an established post office, which must be a blessing, for the reviewer has recollections of receiving mail tampered with so many times as to be hardly worth reading upon arrival. The author's opinion upon women's dress may be challenged, but this is pardonable, for he could hardly have become acquainted with the secluded gentlewomen. The optimism and breeding of the Koreans were impressive, especially in contrast with the Chinese, from whom the natives copied their arts, etiquet and literature.

How different "the Land of Fresh Morning" from the Occident! The lean peasant plows in fear, hardly daring to feed his patient bull enough to appear fat because of the tax-gatherer; the half-naked miner delves for gold and iron, living in a mean hut as far away from the officials as possible; the soldier defends his flag under duress and often without salary; the judge knows only the laws of poetry, music and the Chinese classics; the merchant stealthily ships his goods in order to save *likin;* the man of science and art only lately left the Middle Ages and is endeavoring to intermix metaphysics with evolution: yet this human crust has the Oriental faculty of contemplation and earnestly dreams of a better world to come. Nature is the barometer of the soul, at which the author wonders. The amber skies make glee-time and they thank the Sky-god; frost-tide is the message of the Mountain-spirit, who sends hills of heaped-silver so they dance and feast. They make good Christians, giving willingly of what they have for the privilege of glorifying God and helping others.

The author's political forecast awaits the events of war, yet justice does not indicate that "Korea will be the hopeless sport of Japanese caprice or Russian lust." A study of Nippon and Formosa show what Japan does when civilization arms and trusts her, and even Russia ruling with iron heel may be a means of universal betterment.

What Voltaire says of the royal family of Spain applies to Korea. Every act of the Emperor is mentally photographed. He is the gold-spurred bantam in the cockpit, bandied about by Powers abroad and by a harem at home. When the late Queen, a strong character, was assassinated, her last words were, "I am not sad to finish my path of pain." One recalls the epigram of an Irish-American representing the Starry Flag at Seoul. The Emperor trusted him, so he tasted royal food for poison, tried his bed that secret swords might not pierce him, and acted as bodyguard, carrying about a small arsenal. "Sure," said he, "the manest job on earth is to be King of Korea!"

The author devotes few words to the language, which is the joy of linguists and philologists. The alphabet, created between 1270 and 1616, is the simplest known. Mr. Hamilton puts the date at 1447. According to the Koreans, Sei Chong the Holy made the alphabet of twenty-eight maternal and infant letters, calling them "Enmoun." It says on the tomb of Sin Suk Chu, his friend, that the deceased created the musical letters,

* KOREA. *By Angus Hamilton. With Maps and Illustrations.* New York: Charles Scribner's Sons. $1.50.

Reindeer. From Hamilton's "Korea." Scribner

combined the sounds and fashioned the spelling. The latest researches show that the natives formed their own alphabet and tried to put the letters together in a Chinese way. Each syllable seems to be a cluster of letters, the vowel making the heart. There are thirteen initial consonants, five simple vowels, nine compounds and two composites. Nine finals exist, tho one expert rules that any vowel may be a final. The author writes that only twenty-five letters are in present use. The alphabet, tho always in syllables, is written from top to bottom and right to left. The verb has three tenses, present imperative, past and future. Antique Chinese language is still in use, but the Enmoun script was officially adopted after the Japan-Chinese war. It is very interesting to compare the Korean with other languages. Take the word mother; in Chinese it is *moo;* in Manchu, *umu;* in Mongol, *yika;* in Korean, *amoon;* in Japanese, *haha.* If the author does not spend much time on the language, he devotes considerable space to literature and other arts. The book as a whole shows unusually conscientious work.

Recent Fiction

THE letters of a young society woman, written during a summer vacation to a friend in Washington, are presented in a pretty volume entitled, *A Country Interlude.** And had this been the first book of the kind to appear, it might have created a sensation. But so many pretty witches have been planting gardens and giving their notions of love and pot plants that we are too familiar now with their philosophy along these lines to be surprised at anything they write. To begin with, they all assume a sort of buttercup attitude to nature, and there they remain, kneeling coyly in the meadow grass, writing dew-drop letters to somebody until

* A COUNTRY INTERLUDE. *By Hildegarde Hawthorne.* Boston and New York: Houghton, Mifflin & Co. $1.25.

some man comes along who is interested in that kind of literary buttercup. Then each one begins to add enigmatical *post scriptums* to her letters. Also, she wrings her hands secretly, talks to herself tenderly and tearfully, looks at herself in the mirror questioningly, and, with all these symptoms, declares she "cannot understand" what is the matter. But we "understand"; so soon as one of these female letter-writing geniuses puts on a dimity shirtwaist, a Parisian hat, and runs out in the garden to plant sweet peas, the cynical public knows that a young man is coming down the lane in her direction. And, as in the case of this young woman, it makes no difference if she is already suitably provided with a rich, tally-ho lover, when she settles in the country against a pansy and poppy background she is sure to take the man who fits into the natural scenery. It is a providential way they have of bringing their own happiness to pass, and it is a very attractive method. In this particular volume we must admire the abandon with which the heroine stretches herself upon the grass and makes eyes at nature, —and the confidence with which she falls asleep there!—to awaken and find the hero, pale with emotion, gazing at her. Then the blush—it is astonishing the way these women can describe their own hyperemia. One feels that their very toes are pinked by the experience. However, this book should not be taken literally by other young ladies, who contemplate "country interludes" of their own. It is not really safe to lie out in the weather this way, except in fiction. Not only is there danger from bugs and thunderstorms, but the man who finds the sleeping lady might be a tramp instead of an artist with deep, wild eyes, and curling brown hair.

Much purely petticoat fiction is current just now—that is to say, stories which represent no phase of life so much as they do certain idiosyncracies of the author's tight-waisted lady temperament. Generally there is too much emotion and too little intellectual space in which to display it. Now the author of *The Stone of Destiny* * appears to have written the book with the tears in her eyes. But really nothing in the situation calls for so much feeling. The scene opens upon a woman talking to a baby in his sleep—not an authentic baby, either. We do not know how the story ended, the reader's nerves are so wrought upon in the first chapter that it is impossible to go on without smelling salts. The last we remember is the unusual lady with the unaccountable babe falls asleep, and immediately the author adds, "And she stands at the foot of the hill, which she must ascend,"—when a person of this kind walks in her sleep, even toward the "stone of destiny," it is improper to follow **her.**

A clever story written with a bold, masculine appreciation of the charming absurdities in feminine character, comes from the pen of Brand Whitlock. *Her Infinite Variety* * is the novel in which the temperament and disposition of the refined society woman are opposed to the wit and intelligence of the emancipated professional woman. Incidentally the tale also suggests the "infinite variety" of masculine affections when the hero, who is engaged to one of the high-bred, stall-fed ladies, falls momentarily in love with the pretty woman lawyer.

A certain author living in a large city subscribes regularly for an agricultural paper and reads it for mental refreshment. "There is nothing so realistic in art or literature as a journal of this kind," he declares. "It takes one back to the days when I tended the young lambs and cut clover in the apple orchard." To this class of readers *The Man With the Hoe* † will prove a welcome diversion. It is a story of farm life, written without literary sense, but with a literalness that is alarming. To the rural people, however, whom the author evidently hopes to enlighten, it will not prove an attractive book. When a man has contended with his neighbor's cows and mended fences all day, he is not refreshed by reading of the same experiences in a novel, any more than his shabbily dressed wife will be comforted by the details given of the fictitious woman's meager wardrobe.

The author of *Henderson* ‡ has added the surgical feature to the old situation

* THE STONE OF DESTINY. *By Katherine Mackay.* New York and London: Harper Bros. $1.05.

* HER INFINITE VARIETY. *By Brand Whitlock.* Indianapolis: The Bobbes-Merrill Co. $1.25.

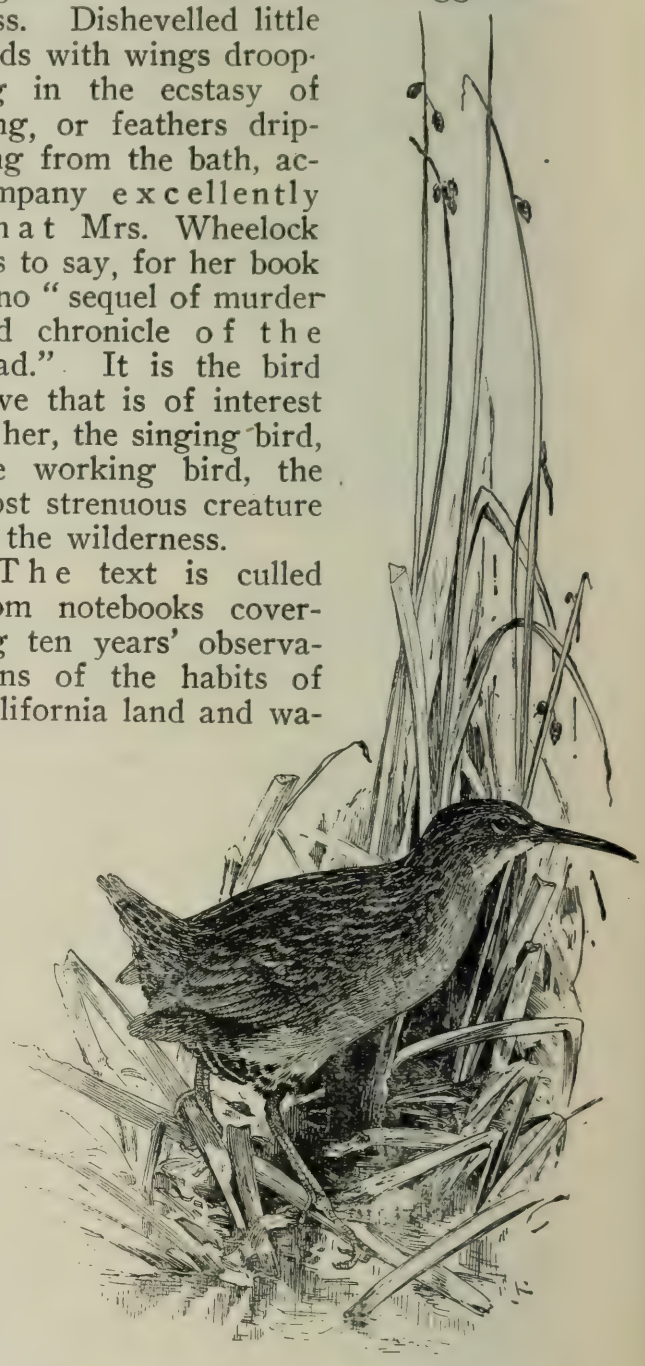
‡ HENDERSON. *By Rose E. Young.* New York and Boston: Houghton, Mifflin & Co. $1.25.

of a man in love with his friend's wife—that is, she has laid the guileless husband on the operating table and made the wife's lover save his life. This is a most unfeeling advantage to take of a man's moral character. But it is the fashion in modern fiction for the writer to set up an exalted standard of morality in the first chapter, give the hero just time to grasp it, then spend all the other chapters in the effort to drag him down from that altitude. The dramatic interest depends entirely upon the vigor with which he wrestles spiritually and kicks morally to maintain his position. Often the poor soul is stretched the whole length of his legs in Satan's direction, and merely holds on by the tip of his fingers to heaven. But people have very strong fingers in fiction. A man in a novel may dangle over a precipice by the main strength he has in them, and, ethically, the same holds good as a figure of speech in Henderson's case. Had the husband not been providentially removed by a stroke of lightning in the very nick of time, it is doubtful if he could have longer held fast his integrity.



Before this time we have admitted that Mr. Hornung knows how to write a popular story, but that has nothing whatever to do with literary art. It consists in the ability to arrest the unliterary fancy of the average reader. His latest novel, *Denis Dent*,* is an example of proficiency in this line. The first scene concludes with two lovers being cast ashore off the coast of Australia. Fortunately, or unfortunately, the hero regains consciousness first, casts a few branches over the lady, and modestly takes to his heels. Later he gets very rich and marries her. The story of Adam and Eve is similar in some particulars,—only Adam was not obliged to discover a gold mine before he could afford the expensive luxury of marriage. However, the gold mine is a popular modern feature in romances, especially of this kind.

* DENIS DENT. *By Ernest W. Hornung.* New York: Frederick A. Stokes Co.

The Birds of California

As a piece of bird-book making, whether regarded from the viewpoint of binding, letterpress, or illustration, this volume* is a step ahead of anything we have seen. Its flexible cover is tempting to the touch and the crisp leaves fly out beneath the thumb with that fine whir which only first-class bookmaking affords. Color is attempted but once, and there delicately. Stiff photographs are willingly missed, all the illustrations being from the pen of Mr. Bruce Horsfall, whose skill is already known. The drawings in the text are more pleasing than the full-page plates, having to a greater degree the fine distinction of suggestiveness. Dishevelled little birds with wings drooping in the ecstasy of song, or feathers dripping from the bath, accompany excellently what Mrs. Wheelock has to say, for her book is no "sequel of murder and chronicle of the dead." It is the bird alive that is of interest to her, the singing bird, the working bird, the most strenuous creature of the wilderness.

The text is culled from notebooks covering ten years' observations of the habits of California land and wa-

From Wheelock's "Birds of California." McClurg

* BIRDS OF CALIFORNIA. *An Introduction to More Than 300 Common Birds of the State and Adjacent Islands. By Irene Grosvenor Wheelock.* Chicago: A. C. McClurg & Co. $2.50 net.

ter birds in the rearing of their young, and is a valuable contribution to this department of knowledge. Among the interesting points brought out are these: That nestlings are almost universally fed at first by regurgitation; that young reared on insect food require more frequent feeding than those that are given seeds, but are fed for a shorter period by regurgitation; and that the most intelligent of the birds—by human standards—are most dependent upon instruction by the parents. Mrs. Wheelock is a direct and apparently unsentimental witness to the contention that some birds do consciously train their young, and many observers in the field will, Mr. John Burroughs to the contrary notwithstanding, agree with her.

It is a pity that Mrs. Wheelock has fallen victim to a malady now common among those who write books for beginners in field work with birds and flowers—namely, the grouping by colors instead of by related orders. A carefully differentiated color key for use in tracing to the text should by all means be provided (which Mrs. Wheelock has not done), but the arrangement there should be by families. One but half knows a bird till he knows its family, and nothing so aids a student as his quickening recognition, after two or three months in the field, of the characteristics of morphologically related groups. A bill silhouetted against the sky may be a sure index, while a fleeting glimpse of color may give no clue at all. Mrs. Wheelock herself, speaking of the Blue Grosbeak, says that the male bird in winter garb has been mistaken for the female of the Cow bird, but adds, "one glance at the bill should correct such a mistake." Yet she gives no description of the beak of either bird, and elsewhere often omits salient features of immediate importance to identification in the field.

Nevertheless, in spite of practical defects as a field book, Mrs. Wheelock's work should be added to every California bird-lover's library for supplementary information and for enjoyment.

Life and Adventures of "Jack" Philip, Rear-Admiral U. S. N. By E. S. Maclay. New York: The Illustrated Navy.

Rear-Admiral Philip achieved prominence in the Spanish War, when he rendered excellent service while in command of the "Texas" at Santiago and elsewhere. He became a popular hero chiefly through his refusal to permit his men to cheer after the destruction of Cervera's fleet. The present work is made up of his journal as a lieutenant kept during the uneventful cruise of the "Wachusett," in 1865, together with a number of commemorative eulogies by personal friends. As the book is designed simply as a memorial of Admiral Philip, criticism of its contents from a literary point of view seems unnecessary.

Rousseau and Naturalism in Life and Thought. [The World's Epoch Makers.] By William Henry Hudson. New York: Imported by Charles Scribner's Sons, $1.25.

This book is a most interesting and instructive study of the life and work of Jean Jacques Rousseau. Tho judicial in manner and apportioning blame and praise with a wise understanding, the tone is sympathetic, and something is shown in extenuation of many of the apparently base and unnatural acts of the subject's life. The biographical part is written with especial care, after a patient examination of the more recent special studies of Rousseau's career, which necessitate a frequent qualification or correction of statements found in the *Confessions*. We have space for a brief summary only. Of the subject's life Professor Hudson writes:

"Rousseau was essentially an egoist and a sentimentalist. A man of morbid and colossal self-consciousness, everlastingly preoccupied with his own emotions, arrogant in the proclamation of his virtues and shameless in the exposure of his vices, he furnished in his voluminous autobiographical writings a gigantic illustration of Rochefoucauld's maxim that we prefer talking about our faults to not talking about ourselves at all; and both his misanthropy and the churlish ingratitude with which he repaid those who did the most for him had their origin in this irritable and insatiable vanity. . . . To me Rousseau, as a man, is a degenerate, who does not even possess the personal fascination which sometimes goes along with degeneracy. Yet the more carefully we study his life and character, the more reason shall we see to temper justice with mercy. Condemn him we must; but our condemnation may rightly be joined with pity."

And of Rousseau's place as an epoch maker, the author writes:

"Without going so far as to say, with Napoleon, that but for him France would have had no Revolution . . . it is none the less beyond controversy that he counted immensely as a revolutionary power. Without reference to him, no record of the forces behind the Revolution would be complete. . . . He was not a systematic thinker; his treatment of life was narrow and one-sided; his philosophy was full of paradoxes and inconsistencies; his teachings seem, from the point of view of the present day, a strange compound of the fantastic and the commonplace, the impossible and the obvious; in the whole body of his voluminous work there is nothing which for a moment we should be justified in ranking among those abiding things of literature which are independent of all fluctuations of theory and taste. . . . Explain him how we may, however, Rousseau's claim upon us is incontestable. He was, as Amiel said, an 'ancestor in all things.' Nor is our interest in him historic only. While we may regard him primarily as a motive force in a period of rapid and widespread change which has now closed, we must remember that we of to-day are still living in the midst of great intellectual and social movements which he did much to inspire. Vastly as their form has altered, their power is by no means spent."

American History and Its Geographic Conditions. By Ellen Churchill Semple. Boston: Houghton, Mifflin & Co.

American history has been treated so fully and by so many skillful hands that its political and personal and constitutional phases seem to be worn quite threadbare. The economic phases, too, are gradually becoming trite, so that the appearance of a book with so fresh a conception of the forces that have guided our development must be greeted with pleasure. The greatest work that has been done heretofore upon the geographic conditions that affected our history was that of Ratzel, the great German student of geography and its political effects. Professor Shaler has also discussed the subject. Professor Turner, of Wisconsin, has contributed some magazine articles showing the deepest insight and acquaintance with the geographic facts that have influenced the growth of the West, but his book, which will be epoch-making for American historical writing, has not yet appeared. For the present, therefore, Miss Semple's book occupies a unique place. Tho the subject is too deep to have a popular interest, yet the present volume is so well written that it is readable by any one who has the slightest interest in the subject matter. There are none of those human details which make political history so attractive, but there are large conceptions, striking relations and tremendous effects which must hold the attention of all who are bold enough to read. We are shown the geographic facts which made the Atlantic States of Europe the discoverers and colonizers of America. The effect of our great rivers on the paths of exploration are then shown, and the influence of the Appalachian barrier upon the English colonies. We see why the advancing civilization broke through this barrier only at certain favorable points, and what was the environment of the early trans-Allegheny settlers. The effect of geographic conditions upon the spread of population in the Mississippi Valley is explained, as are also the physiographic facts which controlled expansion into the far West. The several great Western trails are studied, as are the inland waterways, and the influences that have affected the distribution of railroads. Finally, the United States is studied in its relation to the "American Mediterranean," and as a Pacific Ocean power. There are some sixteen valuable maps, showing the Great Lakes, portages, the trans-Allegheny trails and settlements and the trans-Rocky trails. Maps taken from the Census Reports show the distribution of population at certain periods and the foreign population. Taken all in all, this book is one of the most important books of the year on American history.

Breaking Into Society. By George Ade. New York: Harper & Bros., $1.00.

It would, of course, be impossible for THE INDEPENDENT to commend to its readers a book by an author like George Ade, who is not as careful as he might be about his grammar, and occasionally —that is to say, two or more times in each sentence, introduces a slang phrase. Such writing would be not only distressing but unintelligible to our readers. Nor are the morals he attaches to his fables in all cases the conventional and logical

ones. But if we consider the book as a work on philology, its value will be appreciated. If the publishers would get out an edition in a plain, dark cover and entitle it "How Language Grows," it would find its way into many learned libraries where it would never be read. A hundred years from now it will be a standard book of reference for lexicographers for the earliest recorded use of words which by that time will have broken into society. The book is illustrated in part by McCutcheon and in part by other men, whose pictures are quite as badly drawn but not so funny.

Footprints of Former Men in Far Cornwall. By Robert S. Hawker. New York: John Lane.

It is not probable that many persons in this country read the life of Robert S. Hawker, Vicar of Morwenstow, Cornwall, England, by Baring-Gould, published in 1876, the year after Hawker's death. Those who did read it remember him as a boy remarkable for his pranks, as a man of untiring devotion to the flock to whom he ministered, as a poet of no mean powers. These Footprints are articles contributed by him to English magazines. In abstract literary merit they rank highly, breathing the spirit of an ancient people and the mystery of moorland, cliff and sea which characterizes the "West Country." Hawker was a visionary symbolist and a man of vivid imagination, traits which led him to read into antiquities that which he desired to see, rather than what he could prove. In dealing with legends he was apt to give such rein to his imagination that his tales lost value as folk-lore. Notwithstanding this, the volume supplies pleasant reading. This habit of the author is probably responsible also for some of the mistakes which are explained in notes. We will give one which has escaped the editor. On page 121, Antony Payne, who died an old man in 1691, is made to resent an insult to the memory of Charles I from sympathizers with the Hanoverian dynasty. A General Council could not have imposed belief in the Hanoverian dynasty upon an Englishman ten years and more before the Act of Settlement was passed in 1701.

John Maxwell's Marriage. By Stephen Gwynn. New York: The Macmillan Co., $1.50.

Others may have a larger diplomacy, but the Irishman probably has better use of his tongue for purposes of self assurance and self defense than any other character in fiction or out of it. And for this reason interest in an Irish story usually depends upon some Emerald trick of Erin nature—upon the wit with which the blarney genius escapes the inevitable or coaxes the incredible. But in this volume, altho the characters are Irish and the scenes are laid in Ireland, the one situation that attracts attention might have occurred in any country during the eighteenth century. A company of drunken ruffians force a woman of delicacy and refinement into a marriage she abhors. The one notable scene in the book follows, depicting the outraged fury of the woman. For the rest it is a tedious tale, dragging its length through three generations without a flash of wit to enlighten it.

Poems. By George Cabot Lodge. New York: Cameron, Blake & Co.

The ivory tower into which Mr. Lodge introduces us is an exceeding resonant one, and full of echoes, among which we seem to detect the accents of Swinburne, Tennyson, Browning, Rosetti, or, at least, of some representative pre-Raphaelite organ. In some of these voices we may be deceived, but the influence of Swinburne is unmistakable as well in the thought as in the versification. Like Swinburne's earlier poems (and, indeed, like every one's earlier poems, for that matter, tho the note in this case is peculiarly Swinburne's), these verses of Mr. Lodge's are rebellious with a young man's rebelliousness, which is due partly to impatience of restraint, partly to a kind of nervousness and distrust of untried powers. This spirit of rebelliousness shows itself in two ways—the one social, the other moral. The former is naturally expressed in a wholesale condemnation of stupidity, conventionality and respectability, and in praise of that irresponsible liberty which it is sometimes difficult to distinguish from license.

Mr. Lodge has given voice to it in such pieces as "The Voyage," "The World's Too Long About Us," "Les Bourgeois," "A Song for Revolution," and the like.

"The world's too long about us!—Let us go
Far from the righteous and the ignorant,
The vacant phrases of familiar cant,
The trivial loveless women and the low,
Abortive men, the fashions stale and slow,
The greed of riches and the crime of want!"

"Shake down the sails to catch the blood-red
drift of sunset!
Haste! lest they hold thee slave among the
slaves.
Thou shalt be outcast of their laws and
scorned and homeless:
The sin the world blames is the sin that
saves."

The second form of revolt is manifested usually in an exaggerated insistence upon passion. In this case, while there is much that is one-sided and even a little that threatens to become disagreeable, this insistence is, on the whole, hardly more than a preference of the sensuous elements in life over the intellectual and moral. As such it is in itself rather exhilarating and stirring.

"The flurry of foam flecked red as the dawn
looks over the trees,
And ever the motion of song and the pulse
of ineffable seas
That empty and echoless break on the exquisite balance of air,—
And tenderly winged on the morning, a perfumed and delicate breeze,
Where the scent of the sacrifice floats with
the distant refrain of a prayer,
Where the cry of a bird and the whisper of
grass and the lowing of kine
Are borne through the thunder of waves and
the smell of the brine."

Incomparable Bellairs. By Agnes and Egerton Castle. New York: Frederick A. Stokes Co., $1.50.

The writer who would transfer us to other centuries too often achieves nothing beyond the mere proclamation of the date. His characters may wear the costume of the period and besprinkle their sentences with interjections and other phrases presumably characteristic of the time, but the subtle atmosphere which makes that earlier world live for us with all the vivid reality of our own is somehow not attained. It has been the good fortune of the biographers of Mistress Kitty Bellairs to set this eighteenth century portrait in just the fitting frame of lace and brocade. Powder and patches, silk and perfumes as entirely enfold us as if we were the favored adorers admitted to assist at the last mystic rites of the incomparable one's toilet. So convincing is the eighteenth century flavor of it all that we actually find ourselves going over to the fascinating Mr. O'Hara's superlatively Hibernian moral standpoint and secretly wishing him success in his *rôle* of "gentleman of the road." The one drab touch in all the bright picture is the pathetic story of Rachel Peace, actress and Quakeress, but even that is painted in with a delicacy which makes it seem to tone down the excess of light rather than to mar it by the contrast of too heavy a shadow.

Petronilla Heroven. By R. Silberrad. New York: Doubleday, Page & Co., $1.50.

In portraying the fortunes of Petronilla Heroven, Miss Silberrad shows herself a clever writer. Perhaps the principal criticism which the book inspires is its excess of cleverness. The nameless and neglected granddaughter of a country farmer does not normally speak in epigram nor talk philosophy. There is a manifest effort to represent Petronilla as developing from this estate to that of the woman of the world, but the author's fondness for characters who say smart things overpowers her sense of fitness, and Petronilla springs upon the scene like some rural Minerva, all armed for the battle of wits with her mysterious "woodman." She is always interesting, but her phenomenal cleverness and ability to "come out on top" give her a somewhat apocryphal effect. In less degree this fault marks all the characters of whom Miss Silberrad wishes us to think well. Their wits are a bit too superior. The stupid people are really the most lifelike. The one exception to this is found in the hero. In him there is nothing inherently improbable, and the portrayal of his inner self interests the reader, as it did Petronilla, into forgetfulness of the deformities of the outer man.

Geographic Influences in American History. By Albert Perry Bingham. Illustrated. Boston: Ginn & Co., $1.25 net.

This is an excellent study of an aspect of history which has heretofore received too little attention. Buckle, it is true, laid emphasis on physiographic influences; but in seeking to prove too much he involved himself in a mass of difficulties from which extrication was impossible. There is no attempt in this admirable little book to make physiographic conditions the chief determinant in human history; what is attempted is the indicating of the share which natural factors, such as mountains, valleys, rivers, lakes and seas, forest growths and mineral deposits have had on the trend of migration, the growth of cities and in times of war the movement of armies. All this is very simply and convincingly told, and nowhere does the author exalt the principle about which he groups his facts into an immutable and universal law. The chapter on "The Eastern Gateway" will prove particularly instructive to those who have never reflected upon the natural factors which made inevitable the development of New York City into the nation's metropolis. The chapter on "The Civil War" explains the various invasions of the Northern troops and the defensive lines of the Southern armies as these were influenced by the physical features of the South. There is also to be mentioned, as worthy of particular attention, the chapter on the arid region of the West, which contains a brief account of the wonders which have been effected by irrigation.

An Attempt Toward a Chemical Conception of the Ether. By Prof. D. Mendeléeff. Translated from the Russian by George Kamensky. New York: Longmans, Green & Co., 80 cents.

Professor Mendeléeff is a believer in the use of the imagination as a scientific tool, and his bold hypothesis of the periodic law and its remarkable confirmation has justified his confidence in the value of theoretical speculation. The periodic law was based on the idea of valence, and could not, therefore, foretell the discovery of a group of elements which have no valence; yet when argon, helium and their congeners were found they formed a group by themselves similar in all respects to those of the periodic table. Now, as he says, he is thirty-three years older and more cautious, yet he cannot refrain from venturing a still

Orchard Irrigation, Riverside, Cal.
From Bingham's "Geographic Influences in American History." Ginn & Co.

more startling hypothesis—that is, that the ether, which is the medium of light, electricity and, as he believes, of gravitation, is composed of a kind of matter the particles of which are much smaller than those of ordinary matter. By the method of extrapolation from the periodic table, which, of course, is a much more risky thing than the interpolation by which he prophesied germanium, gallium and scandium, he calculates an element *y* with a density of about 0.2 (possibly coronium) and an element *x* with an atomic weight nearly one millionth that of hydrogen and a velocity of about 2,250 kilometers per second. Such an attenuated gas might pass through ordinary matter, and neither the sun nor stars would be able to hold it in their atmosphere. Elements of high atomic weights like radium and uranium have the power of absorbing by a sort of weak and indefinite form of chemical affinity these ether particles, which may then be emanated and cause light. In this way he would account for radio-activity, auroral phenomena and the light of the sun. He does not attempt to show how such a rarefied gas would answer the physical requirements of the ether as the medium for transmitting light and electricity.

The Mark. By Aquila Kempster. New York Doubleday, Page & Co., $1.50.

A story of India, founded upon astrology, prophetic crystals, transmigration of souls and all the romantic paraphernalia of Eastern metaphysics. Now it is not an easy undertaking to mix love and adventure with any form of ancient mysticism. The average author succeeds about as well as a heretic does at interpreting Scriptures. He lacks the esoteric imagination. His intelligence is merely Occidental, and his mind is not sufficiently subjective to slip away into the trance of Oriental philosophy. But in this book we find the correct atmosphere and evidences of a sympathetic genius at interpretation. The scenery is good and well defined, and the intangible mystery of psychic influences, which rise everywhere in this hoary land like a terrible incense, gives a curious somnambulant effect to each character. The author recognizes the fact that the Eastern temperament, however subjective, is not neurotic, and she founds telepathy and other occult manifestations of the mind upon a scientific and philosophical basis, which is a rare distinction in these days of "emotional" demonstrations of poor hag-ridden human nature. One amusing feature of the book will not escape the observant reader, however—that is, the frequency with which the hero (an Englishman with the soul of an Indian prince, dead these 200 years!) is pulled out of his bathtub. Never does the author dismiss him in order to develop some other character that he does not take advantage of the opportunity to strip for another plunge. Thus, every scene opens or ends with a splash or with a naïvely naked man getting himself vigorously "toweled." The insufferable climate doubtless justifies the insistency of the performance; but before the reader is accustomed to it he is as much startled as he would be bored at the frequency of tea drinking in the conventional novel of English life. And, finally, the illustrations for the story are remarkable both in the character, poses and coloring. The figure of the beautiful witch Lota suggests dignity, cruelty, grace and purity.

Symbol Psychology. A New Interpretation of Race Traditions. By Adolph Roeder. Harper & Brothers, $1.50.

Starting with the promise that there is an infinite God, who reveals himself by infinite means, this author undertakes to show the coherence of some of the symbols recognized by mankind. These are grouped in three classes; the creative cycle, the constructive cycle and the reconstructive cycle. The second cycle is that most fully treated here, and "The Twin-Brother Story," "The Man-Animal Story," "The Captive Maiden and the Sleeper Story," etc., are shown, in a mystical way, to illustrate the fundamental unities in the races of mankind.

An Introduction to Systematic Philosophy. By Walter T. Marvin. Macmillan Co., $3.00.

The chief value of this book, as the author explains, consists in the selection and in the order of the problems with which it deals. It does not purport to be a history of philosophy, nor is it a handbook. The doctrine of the book is a rationalistic idealism; idealism implying

the denial of the existence of a transcendent world. Against naturalism the author maintains that man's ideals can rightly lay claim to the same validity as does his science; in behalf of naturalism he justifies the atomic mechanical interpretation of nature and indirectly of mind. The author presents his problems and explanations in a plain and rather familiar style, and argues his points with earnestness. His book is the work of one who is a teacher as well as a scholar.

Literary Notes

W. Porter Truesdell, of Malden, Mass., announces the immediate publication of two volumes in the ex-libris series. The first of these is "The Book Plates of Mr. Edmund H. Garrett, with a chronological list of his plates up to March First," with text by William Howe Downes, Art Editor of the Boston *Transcript*. The second is "A List of Mr. J. Winfred Spenceley's Etched and Engraved Book Plates," with an introduction and notes by Pierre de Chaignon la Rose. Both volumes will be issued in strictly limited editions. The ordinary copies will be $3.50. Those on Japan paper, $6.00 each.

....The Annual Reports of the Secretary of War, covering the period from the close of the war with Spain in 1898 to the end of the year 1903, have been brought together in a single volume, published by the Government, to supply, in convenient form, an authentic account of the principal events, and the action and policy of the United States during the military government of Porto Rico, the development and establishment of the republic of Cuba, the China relief expedition of 1900, the suppression of the insurrection and the building up of civil government in the Philippines, the reorganization of the army and the beginning of the new militia system.

....Having already noticed the advance sheets of Prof. R. F. Harper's *The Code of Hammurabi*, published by the University Press for $4.80 net, we add, on receiving the bound volume, that it is beautifully printed, both the plates of Babylonian Cuneiform text and the English translation and indexes. We especially note the Glossary, which records all the words in all their grammatical forms and occurrences, thus making the work a student's textbook of the most helpful character. A good map is also appended. The second volume is promised to appear before the end of the year, and to discuss the problems raised by the Code in comparison with the laws of Moses. The publication of this work does credit to the Univerity of Chicago.

Pebbles

We observe that a preacher never calls a man brother who is not a member of his church.—*Washington Democrat.*

...."This is carrying things too far," said the man, as he followed his wife into the fifteenth department store.—*Columbia Jester.*

....An Atchison man hasn't a tooth in his head, but eats as well as anybody. "How do you manage it?" he was asked. "I have corns on my gums," he replied.—*Atchison Globe.*

I shot an arrow into the air;
It fell to earth I know not where.
Till a neighbor came and raised a row
Because I shot his Jersey cow.

I breathed a song into the air;
It fell to earth I know not where,
Till Edison came and gave me the laugh—
He had it in his phonograph!

—*Yale Record.*

$ $ $.

Together they're floating onward,
Free from troubles and cares,
All is sunk in a perfect trust—
The whole wide world is theirs.

Have we a youth with a maiden shy?
No, hardly that you see—
Merely some bloated billionaires
A-floating a company.

—*Harvard Lampoon.*

SPRIG BOEM.

Glad ab I that sprig has cub;
Soon the liddle bees will hub,
Ad the robids id the dree
Will be sigig sogs to be.
Sood the gampus will be green,
Where the studeds may be seen
Wid their rain-goats gast aside,
Showing all their raiment fide.
This sprig boem must now close
So the boet may blow his dose.

—*Cornell Widow.*

Oh, where is mighty Kitchener,
The man of grit and gore?
And Ellen Stone—ah, what of her?
We hear her name no more,
And what's "Coin" Harvey doing now,
And "Sockless" Jerry, say?
Where's Captain Lemly, anyhow?
Has Funston passed away?

Where's Baden-Powell, now, and who
Is watching Simon Sam?
Oh, what's become of Paty du
Whose other name was Clam?

Who, when the snowflakes fly next fall,
May name one Russian chap,
Or still be able to recall
The name of any Jap?

—*Chicago Record.*

Editorials

Judge Parker and Mr. Hearst

It can now be foreseen that a large majority of the delegates in the Democratic national convention will cast their votes for Judge Parker. The turning last week of influential Democrats in all parts of the land toward this silent candidate is easily explained. There was no longer any doubt as to the choice of the Democrats of New York. Until it was known that the friends of Judge Parker would surely control their State convention there was hesitation elsewhere. Here was the only man in support of whom the opposition to Hearst could be effectively organized, if his own State would make him its candidate. When it was plain that at least two-thirds of the delegates to the State convention were already his, support came to him from every direction. The conservative element in the party had already been driven to select St. Louis, instead of Chicago, for the national convention, by fear of Mr. Hearst's influence in the latter city. Alarm excited by the rapidly increasing number of Hearst delegates accounts in part for the same element's joyful recognition of Parker's supremacy in New York.

Mr. Hearst, with the aid of Mr. Bryan, may still be able to control one-third of the national convention. It should be observed that the friends of Mr. Cleveland —the "reorganizers," as Mr. Bryan calls them—have somewhat unwisely hastened to inform the public that the candidacy of Judge Parker is highly satisfactory to them. Therefore Mr. Bryan will redouble his efforts to procure for Mr. Hearst at least one-third of the delegates. We do not think he will be successful in this. Probably his success would not prevent the nomination of Parker, but it might compel platform concessions that would embarrass the nominee.

If Judge Parker should be nominated, his strength as a candidate would depend largely upon his public utterances hereafter to be made. His views upon the political questions of the time are unknown. His letter of acceptance and his addresses might commend him to the people; on the other hand, they might make his defeat a foregone conclusion. But Republicans should not assume that he has no opinions, simply because he has not expressed them. He has been on the bench for nineteen years, and in all that time he has believed that the duties of his position required him to avoid partisan politics. This is to his credit. But politicians should not forget that before he became a judge he was chairman of the Democratic State Committee in a successful campaign.

There is much in the career of Judge Parker that the average American is accustomed to approve. Born on a farm, he became a school teacher at the age of sixteen to earn money that should enable him to study law. In due time and with hard work he became successful in his chosen profession. He is still a farmer—in his vacations. At the same time he holds a judicial office surpassed in eminence and dignity only by that of the Chief Justice, or an Associate Justice, of the national Supreme Court. He is a man of great physical strength, in the prime of life, and he is not rich. A recent estimate makes the value of his property less than $75,000. Judge Parker, so far as his character and life have been disclosed up to the present time, has elements of strength as a candidate which his opponents should not ignore.

The unforeseen success of Mr. Hearst in several States has not been due exclusively or chiefly to a lavish expenditure of money in support of his canvass. Mr. Hearst is not fitted for the place to which he aspires. His nomination would surely be followed by the division and defeat of the Democratic party. The owner of several newspapers of large circulation, he has used these and the attorneys retained in his service for the advocacy of policies and the prosecution of suits which are believed by a great

many persons to be in the public interest. This is our own belief with respect to at least a part of what has thus been done. For such intelligence as this course indicates, and for such devotion to the public good as it may show, he should have due credit. But he has doubtless perceived that in the judgment of many his efforts in behalf of justice are not purely altruistic. The popularity of those efforts, however, is something that invites inquiry.

The platform of Mr. Hearst in the present canvass is almost exclusively his hostility toward Trust combinations, and his defense of "the laboring class," as the South Dakota convention said, "against aggregated wealth." The attitude of the dominant party toward what are commonly called Trusts leaves something to be desired in the interest of frankness and justice. It is true that the Republican party enacted the Anti-Trust law and is responsible for nearly all the legal suits brought for the enforcement of it. But these suits, or a majority of them, were begun only as the result of the persistent and sometimes unwelcome pressure of public opinion; and, with respect to those combinations of manufacturing companies at which the law was aimed, they have been futile. Because the party supports a protective tariff that enables such combinations to extort high prices at home while selling their products abroad at prices much lower; because it has the support, political and financial, of a large majority of those capitalists who gain by the promotion or the industrial operations of such combinations; because its representatives in high office decline to enforce the criminal provisions of the statute in cases where civil proceedings have been successful, and refuse to apply the law in other cases where it appears to have been violated, the way is opened for such forcible criticism and for such appeals to the public as have been made by Mr. Hearst and his agents. It is for these and other reasons that many who suffer, or believe they suffer, by reason of the unrestrained and untouched Trusts, are easily led to think that the leaders of the Republican party, if not the rank and file, are insincere in what they say in platforms about combinations and monopolies.

We do not believe that the President is insincere or double-faced with respect to this or any other question. Why should he not say to Congress and the public, if he believes (as we think he does, and as we do) that the present Anti-Trust law ought not to be enforced rigidly against all existing railway systems, that it should be amended with respect to its relation to railroads? Why should he not say that the same law is useless for the restraint of combinations of manufacturers, that Congress has ignored or rejected the recommendations of his Attorney-General for the only amendments that could make it effective for such restraint, and that the question has become so important and difficult that it should be the subject of special and thorough investigation?

Until this subject is squarely faced and all cause for charges of insincerity and double-dealing removed by a frank admission of the facts, Mr. Hearst and others in sympathy with him will take advantage of an inviting situation. A great many honest men will accept their guidance and regard their defeat as a triumph of injustice. The results of Hearst activities are a mixture of good and evil. Time may show that good is the larger part of it.

An Honest Millionaire?

Can a man starting out in life without inherited wealth, and strictly practicing the "old-fashioned virtues" of frugality, honesty, industry and foresight, accumulate one million dollars before old age incapacitates him and without transgressing the moral law? That he can achieve this degree of business success by means that are strictly legal is not open to doubt. The chief grievance of the American people to-day is that our laws and our administrative methods are such that it is easy for business men of ability to amass great fortunes by methods that the courts can defend, but which a sensitive conscience cannot commend. Our question, therefore, touches moral issues only. What are the facts?

First and most conspicuous is the notorious fact that many of the greatest fortunes of modern times have been made not only immorally but also illegally. One has only to glance through the vari-

ous Congressional reports upon the operations of the so-called trusts to discover that the people have had more than abundant provocation for all their hostility to these great and growing monopolies. Legislatures have been bribed, courts have been corrupted, and rival properties have been attacked by means that even indifferent courts have been compelled to pronounce criminal.

The second fact to be observed is that many great fortunes, against which it might be impossible to sustain charges of criminal taint, have been accumulated by means that have bordered so closely upon illegality that "the talk of the street" brands them as of criminal origin, altho no action has ever been brought against them in the courts. When a man like Thomas W. Lawson, whose name has been brought into public notoriety in connection with the Boston Gas consolidation suit, admits that he and H. H. Rogers, of the Standard Oil Company, made $46,000,000 out of a single deal, the public will naturally suspect that the parties to such a transaction are not eager to have all of its details made known. Whether this particular deal crossed the line of legality or not we may not judge. That is to be determined, if at all, by due process of law. We only remark that such fortunes are naturally under suspicion.

When now the great fortunes that are demonstrably of criminal origin, and those which, altho their character has never been fully revealed, are regarded by financial operators as improperly acquired, have been checked off from the list of millionaire properties, would those that remain endure scrutiny with reference to the merely moral quality of the business activities by which they have been obtained? It is a familiar statistical principle that moral and economic phenomena, like those of physical nature, conform to the law of continuity. Graphically represented, they take the form of a curve that has no sharp breaks. It would contradict all human experience to find that between the gigantic fortunes fraudulently obtained at one end of the scale and the modest properties accumulated by honest thrift at the other end there was not a bulk of intermediate fortunes acquired by shady, altho not illegal, practices. We are obliged, therefore, to say that it is highly improbable that there are many millionaire fortunes that could withstand the scrutiny of the severe moralist, altho they might easily enough pass muster on grounds of technical legality.

Nevertheless, we do not think that it would be possible to maintain the proposition that no fortune of a million dollars has ever been made by strictly honorable activity. We have in mind the case of an inventor who never in all his life engaged in business transactions of any kind whatsoever, but spent his days in a scientific laboratory and arrived at his results by a combination of purely theoretical reasoning and careful experimentation, and who sold his rights in the important discoveries that he made for sums aggregating more than a million dollars. Certainly if this fortune was not honestly and honorably made, no competence, of the humblest owner of shop or cottage, could be called morally unobjectionable. If we are to throw out cases of this kind as immoral acquisitions, we must take the theoretical ground of Proudhon and his fellow anarchists that all property, as such, is robbery.

This example, however, is almost damaging to the affirmative side of the argument, because its highly exceptional character is so manifest. The list of fortunes of such origin would not occupy many pages in the "World Almanac." Of the millionaire fortunes possibly acquired by honorable methods without accretions from operations in stocks, a majority have been made in mercantile and manufacturing pursuits. There is no reason to suppose that their owners have tried to be sharper in driving bargains than their competitors have; they have only been sharper in fact. If the accepted code of mercantile morality can be regarded as satisfactory, such fortunes must be allowed as honorably acquired.

Still, we have one question yet to raise. If the public conscience was so enlightened that no one of three things which we will name could longer exist or be done without reprobation, could any self-made individual honorably acquire a million dollars? The three things are these: (1) Dismissing old and faithful employees without provision for old age when their usefulness has ceased; (2) concealing from the other party to a business transaction damaging facts known

to the party of the first part; (3) exploiting privileges conferred by law upon individuals or a class, at the expense of the general taxpayer. Our question in this final form we commend to the conscientious consideration of all morally sensitive millionaires.

Death and the Heart

NEWSPAPER readers have been rather startled recently by the announcement from one of the most distinguished and conservative of American surgeons, Prof. W. W. Keen of Philadelphia, that patients apparently dead from chloroform narcosis during the course of an operation, and in whom respiration and heart beat had stopped for some minutes, might be practically brought back to life by an incision of the diaphragm and actual direct massage of the heart. The announcement, however, is not so much of a surprise to physicians, since for some time it has been recognized that irritation of the non-contracting heart might cause it to resume its contractions once more. In animals apparently dead from drowning, for instance, it has been shown over and over again that intermittent pressure upon the exposed heart will cause it to resume its contractions once more, and thus the animal may be restored to life. Professor Richet, of Paris, used to say, in his physiological demonstrations, "This dog is dead, yet I shall bring him back to life." What he meant, of course, was that if nothing is done this dog's heart will never beat again, tho life is not extinct and we can cause the heart to resume its contractions by irritating it in such a way as to cause it to resume its work.

How enduring the vitality of the heart muscle is is likely to be well realized by those who have seen the heart of a frog removed from the body of the animal and beating for many hours. Under favorable circumstances, even after the lapse of several days, spontaneous contractions of the batrachian heart can be secured by a certain amount of irritation. In the higher animals this was not supposed to be true until recent years. It has been shown, however, that if the heart of such an animal as a dog even be frozen immediately after death, and allowed to remain frozen for twenty-four hours or even longer, massage of the organ will bring about a restoration of spontaneous rhythmic contractions. From this to the application of this principle and therapeutic method to the hearts of human beings that have stopped beating for only a few minutes is not a long step, and at last it has been taken. In at least two cases that have been reported the patients have been successfully restored to life after apparent death, and when the heart beat had ceased entirely for at least five minutes in each case.

This essential vitality of the heart muscle will not be surprising to those who realize that this organ is the first to show signs of life in the human embryo, and is probably also the *ultimum moriens*—the final lurking place of life, the last tissue to give up its vitality. There is no doubt in the minds of many physicians that for some minutes after respirations have ceased in many patients and the individuals are supposed to be dead the heart continues to beat, tho feebly, and at times the pulsations of it can be felt in the arteries—not at the wrist, which is too far away, but in the carotid, which is much nearer the heart. Hence occasional restorations to life after respiration has apparently ceased.

This procedure of irritating the heart muscle into renewed activity is not so novel as it might seem. Methods of resuscitation after drowning usually call for pressure upon the thorax in various ways and the practice of artificial respiration. Under these circumstances the heart muscle is massaged somewhat by the chest walls and their movements, and by the movement of the lungs as they expand and contract under the influence of artificial respiration. While the method of resuscitation after drowning by rolling on a barrel used to be applied with the idea of removing water that the patient was supposed to have swallowed, and whose presence was causing difficulty of respiration, some of the successful results accomplished by the method were undoubtedly due to the pressure upon the thorax produced by the rolling movement. In newly born infants who fail to begin respiration promptly intermittent pressure upon the

thorax, while heretofore supposed to be directed entirely to the lungs, undoubtedly has its effect also by the irritation of the heart muscle as a consequence of pressure upon it.

This new advance in surgery, which is meant only for extreme cases that would otherwise have to be given up for dead, is only another step in the modern surgery of the heart that has developed within this last decade. It has been shown now in a number of cases that a wound of the heart is by no means necessarily fatal; that it can be diagnosed by certain symptoms and that the surgeon can save life by fearlessly opening the thorax and putting sutures into the gaping wound in the heart muscle which is preventing the organ from accomplishing its work as a pump. The heart not only does not resent this surgical interference, but continues its work very faithfully during the operation, and immediately afterward reacts so as to bring about a better general condition of the patient. If the wound is in a thin part of the heart muscle the prognosis is not so good, but the thick important muscle of the left ventricle, on which all the rest of the vitality of the body depends for its nutrition, will stand the surgical procedure very well. It is interesting, too, to realize that this is the part of the heart which is most exposed to injury, since where the heart presents anteriorly immediately beneath the chest walls the thin right side of the heart is protected by the resistent sternum or heavy breast bone, leaving only the remediable left ventricle exposed to wounds that may occur between the ribs.

The Tibetan Crisis

The British mission to Tibet, which has been so often and so solemnly asseverated to be purely pacific, commercial and diplomatic, has reached a crisis, which was probably anticipated by everybody, but which in its form is unexpected to all. That the Tibetans should allow an expedition composed of their hereditary enemies from India and of the dreaded Europeans to enter or approach the sacred city of Lhasa without stubborn resistance by the priest and people who have guarded it inviolate for a century was incredible. However peace-loving and non-resistant Buddhism may be in theory, the Buddhist priests of Tibet are not at all averse to leaning strongly on the "secular arm" for the protection of their shrines, as the experiences of many ambitious travelers prove. For three days a solemn commination service had been held in the temples of Lhasa, and the Tibetans who stood behind the stone wall at Guru evidently relied strongly on the potency of the official cursing, or they would not have opposed their matchlocks and swords to the magazine rifles and Maxim guns of British troops.

One can hardly decide which party showed the greater rashness, the Tibetans or the British. The Tibetans permitted the British to enter their country unmolested over the most difficult mountain pass ever traversed by an armed force, at an altitude as great as that of Pike's Peak, in the dead of winter, at a temperature which the mercury thermometer could not record, up slopes as steep as one in three, over windswept barrens of gneiss and lichen 2,000 feet above the timber line, forty miles over the ice without a road. For three months over this route supplies have been carried into Chumbi from India at the rate of 40,000 pounds weight a day, on the backs of mules and men, for the oxen from the valley and the yaks from the mountains perished by thousands in the work of transportation. If to the natural and climatic difficulties had been added persistent attacks by natives familiar with the country and acclimated to the altitude, it would have been almost impossible for the expedition to penetrate into Tibet and maintain itself there.

But the Tibetans left the natural fortifications of the country undefended, met the English in the open valley, allowed themselves to be completely surrounded, and then they fought; furiously, fanatically and foolishly.

On the other hand, the customary contempt of the English for "lesser breeds," which has so often caused unnecessary trouble, has never been more strikingly exemplified than in this incident. It is reported that within thirty feet of this armed and ignorant rabble of 1,500 Tibetans drawn up in battle array to oppose the invaders, known to be led by

the generals and priests most hostile to them, stood both the civil and military authorities, Colonel Younghusband and General Macdonald, altho if they had been killed, as they would have been if the Tibetans had shot a little straighter or charged more quickly, the expedition would have been left without a leader. The rest of the officers were also standing close by, eating sandwiches, talking and laughing—we can imagine what their jests were—and the newspaper correspondents were industriously taking notes and manipulating their kodaks so that readers of the *Graphic* might see how the Tibetans looked in their pen with the Ghurkas searching them for concealed weapons, and poking them about like cattle with the butts of their guns.

Ten minutes later there were five hundred dead and wounded Tibetans lying on the ground. That ten minutes may be a critical point in the world's history, for it is likely to disturb the delicate balance between nations by which peace is preserved. Certainly many nations will be affected. The Tibetan mission has been strongly opposed by a considerable portion of the British public, even when it was assumed to be a peaceful mission, and now that it has developed into what they call "a second Jameson raid," the opposition will be strengthened, and it will perhaps lead to the fall of the Ministry. The *Daily News* says, "No more wanton or discreditable business has been brewed by our pro-consuls in India since the time of Lord Lytton."

Tibet is nominally a Chinese province, and altho the British Government has claimed that it was acting with the approval of China, it is not at all certain that this approval will extend to such a massacre of prisoners as this, and the military measures which will have to follow it. Between the Russians in Manchuria and the British in Tibet, China may find it hard to keep her temper and preserve that strict neutrality into which the Powers have schooled her.

We do not lay much stress on the finding of Russian arms and ammunition on the Tibetan officers, whether these were bought or stolen or obtained as gifts. Evidently the Tibetans have not had so much advice and assistance from the Russians as the English papers would have us believe, or they would have shown more intelligence and discretion. Dorjieff, the mysterious Russian envoy at Lhasa, if he had the power he is credited with, should have given the Tibetans a hint that would have kept them from being slaughtered like pigs in a pen. But just two months ago Russia announced to the British Government that

> "such an expedition into Tibet is calculated to produce a situation of considerable gravity, which might eventually force the Russian Government to take measures for the protection of its interests in those regions."

In any event, "the forbidden land" of Tibet is now forcibly opened, and like "the hermit kingdom" of Korea, becomes at once one of the storm centers of the world. Tibet is the last fastness held against the curiosity and cupidity of the Caucasian, and the last stronghold of magic and mystery. The Mahatmas will have to move into the fourth dimension now this last habitation is taken from them.

False Prophets

In 1797 Count Joseph de Maistre, than whom no writer has more ably defended Papal absolutism, in answering the question, "Can the French Republic Last?" said:

> "We are pointed to America. I know nothing so provoking as the eulogies pronounced on that babe in swaddling clothes. Let it grow."

Thus the illustrious author expanded his thought:

> "Not only do I not believe in the stability of the American government, but the peculiar organizations in English America do not arouse confidence in me. The cities, for example, inspired by a miserable jealousy, cannot agree on any place where the Congress shall sit; no one will yield the honor to another. Consequently, it has been decided to build a new city, which shall be the seat of government. The most desirable place has been chosen on the banks of a river; it has been decided to call the city *Washington;* the locations of all the public buildings have been assigned; the work has been begun and the plan of the *Queen City* has been circulated in all Europe. There is nothing, of course, in all this that surpasses human ability; a city can be built well enough;

and yet there is too much deliberation about this, too much conscious planning; and you can wager a thousand to one that the city will never be built, that it will never be called *Washington*, and that Congress will never sit there."

But it was built; it was called Washington, and Congress still sits there.

Let us take another example. It was just after the conclusion of the Civil War that Dr. J. C. Nott, famous for Nott and Gliddon's "Types of Mankind," thus wrote from Mobile about the freed slaves:

"What must be the fate of this unfortunate race? I was born among the negroes of the South, have spent many years in the study of their national and civil history, and feel confident in the prediction that they are doomed to extermination—an extermination which is being cruelly hastened by the unwise action of a party that will not study and comprehend the subject it is dealing with. The negro has an instructive and unconquerable antipathy to steady agricultural labor, and must therefore be gradually supplanted by the whites. . . . Negro population, out of slavery, can never become dense. . . . Slavery is the normal condition of the negro, the most advantageous to him. . . . I see but one duty remaining for you [of the North] to perform, and that is to assist us in feeding and clothing colored paupers. The old, the infirm, the women and children, the worthless vagrants, will form a burden that we are unable to carry. . . . I say, then, that you have brought this state of things upon the South, in spite of remonstrances, and you must 'pay out' or see the victims of your policy starve."

But they have not suffered extermination; they did not starve; the country did not have to feed and clothe them; they showed no antipathy to agricultural labor; they have increased from four million to eight million souls.

So much for that false prophet.

We have given these examples out of no special interest in the prophets or the prophecies; they are now mere curiosities of past generations. But we give them for the lesson of this day. It is very dangerous to prophesy against Liberty. The prophet who sides with Liberty, who has faith in freedom of thought and action, who believes that the people can be trusted to move right without being driven—his prophecies will come true; while the man who prophesies against Liberty is sure to be discredited by time.

Who says that the right of one's own best private judgment in religion will lead a nation to ruin? Who says that self-government will never work in Haiti, or Cuba, or Mexico, or the Philippines? Who says that it is dangerous to give common people too much education? Who says that in our country liberty and license will bring us to destruction, if we do not restrict free immigration, and limit the suffrage? They are all false prophets; do not believe them.

Philippine Independence

We have received a copy of a petition, addressed to half a dozen as yet non-existent bodies, which we are asked to sign and support. It reads as follows:

"We, the undersigned, members of all political parties, join with the above named committee in urging upon the approaching National conventions the adoption of resolutions pledging to the people of the Philippine Islands their ultimate national independence upon terms similar to those offered to Cuba."

This petition we shall not sign nor support.

A long list of signatures overshadows the petition, among which are many distinguished names. Among them, of course, are Charles Francis Adams and Charles Eliot Norton. There are college presidents—Chase, of Bates; Eliot, of Harvard; Hall, of Clark; Hill, of Georgia; Hyde, of Bowdoin; King, of Oberlin; Schurman, of Cornell, and Sharpless, of Haverford. There are college professors—James, of Harvard; Laughlin, of Chicago; Seligman, of Columbia; Sumner, of Yale, and Van Dyke, of Princeton. There are clergymen of distinction—Cardinal Gibbons, Bishops Huntington, McVickers, Potter and Spalding, and plain but famous Reverends—Felix Adler, W. R. Huntington and C. H. Parkhurst. There are also men of political, literary, financial and miscellaneous fame—Carnegie, Judge Gray, Howells, Lummis, MacVeagh, Hoke Smith, Horace White, Edmunds and Gilder. The list, we say, is somewhat imposing, or would be if we did not know that they represent a decided minority of the college presidents and professors, the bishops and unmitered clergy, the statesmen, financiers and authors of the country.

The petition is addressed to the approaching convention of all parties. Possibly the Socialists and the Prohibitionists and the other small parties whose names one forgets may do what is asked, for they are in search of issues that will catch straying voters, and have a way of miscellaneous indorsing; but it is the Democratic Party which this gun is aimed at, for they know that the Republican Party will decline to do what is asked.

We also decline to approve. Think what is asked. It is that the great island of Mindanao and all the pagan and Moslem peoples be put under the rule of Luzon, or that part of Luzon which controls that island. It is that the Tagals shall rule over the Irrogotes and Moros and all the other tribes and religions. It is that some possible Aguinaldo shall be the Dictator over a hundred islands. It is that these fair and now peaceful i lands shall be given over to oppression and revolution. It is that political and religious liberty should come to an end; that native priests and Spanish friars should be let loose in bloody conflict; that the peaceful development of business and trade should be overthrown, and that general anarchy should alternate with dictatorial oppression.

But the petition says "*ultimate* national independence." What does that word "ultimate" mean? If it means anything, it means the condemnation of the policy of Presidents McKinley and Roosevelt and Governor Taft. It does not mean to tell the Philippine people that fifty years hence, when they have been educated to the American ideas of self-government, they may, if they will, put on the garments of adult independence, but that they shall be encouraged to expect that what we have yielded to Cuba immediately shall in a brief time be given them.

These names do not daze us. We are used to seeing a large contingent of scholars and statesmen who fear to point the future duty, who have outgrown their youthful enthusiasm and courage. We stand with President Roosevelt and Secretaries Root and Taft, and share their sober joy in a determination to give the Philippines self-government just as fast as the people can learn to exercise it. We will have no permanent subordination of colonies like India. We will produce a government of Filipinos as free as that of Canada or Australia, and as soon as possible. Already a self-government by their elected Congress, as complete as that of Porto Rico, is planned; and it will go further, in Porto Rico first and afterward in the Philippines. If, then, the people there want complete independence it will be time to raise the question, and we should be as likely to favor it there as in Canada or Australia; but now is no time to raise false hopes or to make futile and cowardly promises.

Minister Bowen's Protest

The papers report a protest by Mr. Bowen, American Minister to Venezuela and the representative of Venezuela in the contest before The Hague Tribunal, against a portion of the decision of the arbitrators. This is by no means a repudiation of the award of the court, which is loyally accepted, but a protest against a portion of the reasoning on which the decision is based. That decision we believe to have been unfortunate and such as will encourage strong states to bring force to bear on weaker ones. Mr. Bowen's protest will rob the decision of the force of an unquestioned precedent. It will be remembered that the court first tried to defeat the meaning of the protocols so as to defeat the provision that English should be the language in which the proceedings were to be carried on. Now the protest claims that the decision is based on an attempt to change the meaning of words in a document whose meaning was never in dispute. The question is as to the meaning of the expression "all claims against Venezuela" in a letter of Mr. Bowen left in the hands of Sir Michael Herbert January 23d, 1903, which the arbitrators say must be interpreted to mean only the claims of the three allied Powers, Germany, Great Britain and Italy, while Mr. Bowen protests and fully proves that it means all claims of these and the other non-allied Powers. We are glad, for the sake of precedent, that the protest has been made, and we trust that the precedent, which makes for violent action, will not be maintained in subsequent affairs of the sort.

Mr. Folk's Candidacy

If the clergy were ever justified in going into politics, they were last week, when forty-five ministers, representing every denomination and sect of St. Louis, united in an appeal to the people for the purification of the ballot at the coming election. The appeal reviews the brutal methods of the machine, condemns the excise law, the police system, and the "respectable" rich bribe givers. It has been sent to every voter in the State of Missouri and we are glad to hear it is having much effect. As the Democratic machine of St. Louis has already repudiated the city's most distinguished Democrat, Prosecuting Attorney Folk, it is hoped that this local hostility will be counterbalanced by the ministers' appeal to the State at large. Mr. Folk certainly deserves to be nominated by his party for Governor. If his party should decline to nominate him, it would thereby place itself on the side of the "grafters," whom he has successfully prosecuted.

Trade with the Philippines

The House ought not to accept and approve the Senate's curious doctrine that the Philippines are foreign enough to be outside of the tariff wall, but not foreign enough to enjoy the benefits of competition in ocean freight charges. If the islands are so clearly territory of the United States that they must be subjected to our coastwise navigation laws, at the cost of a large increase of freight rates, they should enjoy the same freedom of trade that is given to other places where those laws are enforced. Favorable consideration of the Frye bill should be preceded by the removal of our tariff on Philippine products.

Radium in Mineral Waters

The study of radio-active substances has led to methods of qualitative analysis as much more delicate than the spectroscopic as that is finer than the method of precipitation. The astonishing possibilities of this new process of analysis are shown by the detection in the mineral water of Bath, England, of radium salts, recently accomplished by R. J. Strutt, the son of Lord Rayleigh. Just as barium sulphate is less soluble than strontium, so radium sulphate is less soluble than barium, and it probably requires several hundred million times its weight of water to dissolve it. Yet in the residue of ten liters of the Bath water it was possible to detect and identify it. The residue left on evaporation was sealed up in a hard glass tube for a fortnight to generate a sufficient quantity of its emanation. It was then heated and the emanated gas mixed with air was passed into the receiver of an electroscope, which measured its radio-activity by the rate of leakage of electricity. The gas was then pumped back into a holder, and after a few hours tested again. The power of ionization on causing the leakage of electricity fell to one-half its original value in 3.5 to 3.8 days, which is the rate of decay of the radium emanation and very different from that of polonium and thorium. The deposit on the inside of the tanks at the spring was found to be much richer in radium than the dissolved salt. The amount of dissolved salts delivered by the water of the spring is estimated at about 1,000,000 pounds, and in this there could be not more than one-third of a gram of the radium salt. The volume of gas delivered by the spring is about 100 cubic feet a day, of which about one-thousandth part is helium; this amounts to about 1,000 liters of helium a year, which is what is to be expected from the disintegration of the helium contained. Mr. Strutt has detected radium in a number of minerals, such as samarskite from North Carolina and pitchblende from Cornwall, using not more than 10 to 50 grams for the test.

The Alphabet

The interesting article by Andrew Lang in this issue on "The Beginnings of A B C" should be read with some caution. Mr. Lang has been more a student of mythologies than of epigraphy. He goes beyond Evans and Petrie in his easy discovery of Greek letters on old Cretan and Egyptian pottery. And it is curious to find no mention of the Hittite and Cypriote characters with which Evans compares his Cretan hieroglyphs. A great deal of imagination may be easily exercised by scholars eager to make identifications. A cross on old pottery is not necessarily a *tau,* even if that was the

shape of the Phenician letter, and it may have had independent origin, with different meanings, or no meaning at all, in Egypt, Portugal, Panama and New Guinea. De Rougé's theory is not as absurd as it is represented, nor is it quite discarded, altho other origins than the Egyptian are suggested, which can be tested when we know the pronunciation of the Hittite and Cretan characters. We know now four independent ancient systems of writing that grew out of separate original sets of hieroglyphs, the Egyptian, the Babylonian, the Hittite and the Chinese, suggesting four original seats of culture. How many more there were we do not know, nor whether the Cretan and the old pottery marks were independent of all these. We wait for more material and more decipherment.

Doctors of Sacred Scripture

Pope Pius X does not seem inclined to revoke the powers of the Biblical Commission appointed by his predecessor, even if he does condemn the results of biblical study as given out by the Abbé Loisy and other French scholars. In an Apostolic Letter just issued the Pope recalls the purpose of the Biblical Commission, "which, while guided by the doctrine and tradition of the Church, was also designed to utilize the advance of erudition for the legitimate exegesis of the Bible, and at the same time furnish Catholics with aid and direction in Scriptural studies, and settle any controversies that might arise among them." The value of such a Commission depends on the spirit with which it does its work. It may be to develop, or it may be to repress, free investigation. It is a question what would be regarded as "legitimate exegesis." In this Pastoral Letter Pius X regrets that the liberality of Catholics does not yet allow him to establish in Rome a special institute of Scriptural studies; but he directs the Biblical Commission to provide for the examination of students of Scripture, who shall be candidates for the degrees of Licentiate and Doctor of Sacred Scripture. Candidates must already be priests and have received the degree of Doctor of Sacred Theology from some approved university or institute, and must pass a thorough oral and written examination, and defend a thesis at a public meeting in Rome. This is a most commendable scheme. We have a plenty of Doctors of Divinity, and Doctors of Sacred Theology; now we shall have Doctors of Sacred Scripture, students of the original and kindred languages, of the manuscripts and versions, of criticism higher and lower; and the result, no matter how "guided by the doctrine and tradition of the Church," cannot but be good. Why will not some Catholic millionaire of America found the Institute of Scriptural Studies at Rome, which the Pope desiderates? We can hardly ask Mr. Carnegie to do it, or Mr. Rockefeller.

A Veto Rejected

Under Senator Gorman's rule the Maryland Legislature has approved the constitutional amendment intended to perpetuate the control of the Democratic Party by disfranchising as many negroes as possible, and it has thus refused to receive Governor Warfield's veto message on the ground that he has no right of veto of such a bill. In this case it is clear that it is not the fear of negro domination but of Republican domination that inspires the action of the Legislature, for white men are vastly in the majority in Maryland. It is a rebellion against popular government as bad in spirit as that which creates revolutions in Colombia or Haiti combined with a will that denies freemen's rights to negroes. We are reminded of the action of a political association in Brazoria County, Texas, that has lately passed the following frank resolution:

> "*Whereas,* The negroes of Brazoria County submit to the control and authority of the white people of the county with a willingness that amounts to approval; and,
>
> "*Whereas,* They place themselves, their families and their small possessions submissively in our hands for protection; therefore, be it
>
> "*Resolved,* That we pledge ourselves to protect them as citizens in every right that the laws of the country give them, and that so long as they look to us for their protection and the protection of their property, and recognize the social differences existing between the two races, they shall find in us their friends and protectors."

Which means that those who do not sub-

mit to civic, social and political debasement are not safe in life or property.

We find the following startling statement in the *South American Journal* for December 26th in "*Impressiones de Viage,*" by John Samson:

"Some of the churches of Rio de Janiero are splendid, and I think I am correct in saying that the recently completed temple, 'Candelaria,' is the finest ecclesiastical building in South America. I have never seen anything so magnificent, yet so chaste in design, though I believe that in actual bullion value some of the cathedrals in Mexico and Peru would surpass it, Puebla, for example, where the pillars, over three feet in diameter, are of solid gold."

This, in so far as we rely upon it, explains what has often puzzled financiers, what became of the ten billion dollars' worth of gold which has been mined in the last 500 years. A good share of it has gone to the Puebla cathedral; for, assuming that the pillars are only twenty feet high, they would cost $886,000,000 a pair. This seems high for pillars, but probably they were got at a bargain sale, marked down from a billion.

In one of the States of the Union its highest legal officer reports that there were 222 homicides in 1903, and in the last fifteen years he reports that there were 2,781 murders in that State, or one to every 481 inhabitants. And yet it has churches, colleges and a certain public school system; and the leading Presbyterian paper of the State says:

"Universal education in any other than a pure democracy is sure to be fatal. It is not a democracy. It is a pure aristocracy, so far as social and political life is concerned."

Possibly there is some connection between an excessive number of murders and a denial of universal education and democracy.

There can hardly any better work be done for public decency than that which District Attorney Jerome, Democrat, is pushing before an unwilling Republican Legislature of this State for laws that will allow him to suppress the big and exclusive gambling hells in which millionaires play and lose high stakes to Canfield and Farrell and Kelly and their associates, who safely defy the laws made to convict the small pool sellers and crap shooters. It is a shame to the State that men high in political office, even State Senators, should be in Canfield's pay and lobbying to protect him. Mr. Jerome is said to be a reckless fellow, but is one of the healthiest, as he is one of the breeziest, of our teachers of political morals.

It was Christian missions that started the movement for Western civilization in Japan, which soon grew far beyond their means of instruction. Similar is the beginning in great China and in little Korea. In Korea there are now 30,000 Protestant Christians. In Northern Korea eight years ago there were but half a dozen little groups of Christians; now there are 235 meeting places. At Fusan, near the southern terminus of the railroad to Seoul, one Presbyterian medical missionary has treated fifty thousand patients in eight years. And American business influence is similarly beneficial in building the railroad, introducing the street railway into Seoul, and opening mines.

Dr. Timothy Richard, one of the most intelligent missionaries in China, says:

"Hitherto mission boards have been satisfied with starting elementary schools. If they had founded only one grand university instead of the hundreds and hundreds of petty primary schools, China might have been almost won to Christ by now."

We are not sure of that, but the greatest work of undermining faith in paganism in India has been by the universities. And in Japan it has been the higher education that has created the new empire.

The Russians seem to be really waking up on sea and land, and their torpedo boats are doing good service at last in repelling the Japanese attempts to close the entrance to Port Arthur. It looks as if we might really have a decently contested war.

Insurance

Your Wife's Salary

To the query, "What is your wife's salary?" there can, of course, be but one answer. Wives do not receive salaries. Generally speaking, they are merely allowed their board and clothes. They do not financier in the strict acceptance of the term, nor do they lay by anything for times of sickness, disability or old age. Their husbands do that for them, at least in theory, and the earnings of the wife go toward the care and support of the family. Many men are very thoughtless about such matters, but they are pretty mean, nevertheless, if they let matters drift along from year to year and make no provision, in case they are suddenly cut down, for her whom they have individually sworn to love and cherish. The law provides that the wife shall have a definite portion of the estate left by her husband when he dies, but this does not signify much if he leaves no estate. A thousand things may conspire together in such a manner that nothing remains as an estate. Business risks, bad investments, hard times, luxury, all these may account for the lack of residue, but they may leave the wife no estate. What then? Life insurance is a provision for the wife that is definite, sure and, as a rule, easily obtained. Few men will care to deny that a good wife deserves something definite and sure. Now, does she not? Is your wife not entitled to a salary? Does she get it? If not, why not?

Delusive Insurance

A Brooklyn member of the American Order of United Workmen has recently written a letter to one of the local papers in which he complains bitterly because his premium assessments show such a persistent tendency to increase. From his letter, as published, it appears that when he joined the order he paid $1.10 a month, or $13.20 per year, for an insurance policy of $2,000. His assessments were increased from time to time until they became $3.84 monthly, to which he made no objection. He does complain, now, however, because he says "when January 1st comes my assessment will be $8.40 per month, and I shall be forced to give up. That is a higher rate than the old-line companies charge on $2,000." This is another example of delusive insurance. The idea that life insurance that is not delusive can be maintained, notwithstanding the immutability of mathematical laws and quite in defiance of them, has in the writer of the complaining letter one more victim. In the beginning he got his insurance too low, and he was pleased. The figure at which he now obtains it is too high, and the result is his displeasure. The American Order of United Workmen, in trying to remedy the mistake of originally selling insurance for less than cost, does this man an injustice, from his point of view. If the Brooklyn letter writer had died some time ago his beneficiaries would have won out because of his taking off, always provided they had collected the insurance. He does not seem to be thankful that he is living, because through his survival he is called upon to share in making up for the losses arising because of certain policy holders, having died early, paid for their insurance much less than they should have paid. It is impossible to disregard the law of averages in sound life insurance, and it is at this point that the "fraternals" seem to have been and still are the weakest. The case of the Brooklyn A. O. U. W. member who writes the complaining letter is a very sad one, but it may be some small consolation for him to know that his experience is not unique.

The Mutual Life Insurance Company has issued to James C. Colgate, of the banking house of James B. Colgate & Company, the largest life insurance policy ever taken out by an individual—namely, one for a million and a half dollars. All of this amount except a quarter of a million has been reinsured in other companies. The Mutual Life has outstanding a number of policies of a million or more, including one on the life of George W. Vanderbilt.

....Announcement has been made that the German Government has placed fire and marine insurance amounting in total to $280,000 upon the exhibit which it will install at the St. Louis Exposition. This insurance will run for a period of ten months.

Financial

Copper Trust Profits

OWING to the quarrels of a group of financiers concerned in the combinations to which the gas business of Boston has been subjected, the public is getting information as to the highly profitable manipulation of the several properties that were combined in the Amalgamated Copper Company. Testifying last week in a suit growing out of these quarrels, Thomas W. Lawson, the broker and financier who built a yacht for the defense of the "America's" cup, said that for several years he had been associated in business so intimately with Henry H. Rogers, of the Standard Oil Company, that no written agreements or other papers had been used by them in transactions amounting to more than $100,000,000. "We had one deal," said he, "that netted more than $46,000,000 in profits, and concerning which no writing ever passed between us."

Altho he did not say so, it was at once seen that he had in mind the formation and promotion of the Amalgamated Copper Company, which was at first commonly known as the Copper Trust. Following his testimony there have been published statements in detail, apparently coming from persons familiar with the history of that Trust, which show that his estimate of the profits of the organizers and promoters may not have been too high. The Anaconda shares, bought by the promoters at an average of $30, were put into the combination by them at $60. Parrott Company shares, for which they paid $20, went in at $35; Butte and Boston shares, bought at $40, were exchanged for $100 in Amalgamated; for each share of Boston and Montana, bought at $300, $500 in Amalgamated was received. The entire profit, at these rates, was $45,250,000, or almost exactly the $46,000,000 mentioned by Mr. Lawson. It could be realized, of course, only by unloading the stock of the Amalgamated Company upon a trusting public. Thousands of buyers, in all parts of the country, remember with sorrow or anger how the unloading was accomplished while the shares were selling above $90, and rising at times even to $130. Profits of distribution may have exceeded $46,000,000, for much of the stock was sold above par, and some believe that "insiders" made large gains by short sales for the decline, when the shares, depressed by a cut dividend, were traveling the downward road toward $33. Possibly Mr. Rogers intends to testify in this suit; if so, the public will read with much interest his reply to Mr. Lawson. From the beginning this project of promotion and combination had the official support of names representing great forces in the world of finance. Owing to the wide distribution of shares among trustful investors of small means, the millions of profits were obtained at the cost of much misery and many suicides.

A ST. PETERSBURG paper says that the expenditures upon the Siberian railroad and enterprises connected therewith have amounted to $483,827,000.

....The English branch of the General Electric Company has obtained the contract for the equipment of the Yerkes underground roads in London, amounting to about $7,000,000.

....To protect existing steel factories and to invite investment in additional ones, Mexico, on April 1st, imposed a duty on steel rails and largely increased the duties on other steel products.

....The Steel Corporation has obtained another contract for rails to be laid in Korea, selling 10,000 tons at about $20 per ton. The price of the 40,000 tons sold to the Canadian Pacific was $21.25 at Montreal. For the domestic trade the price is still $28.

....Thomas Lyman Greene, vice-president and general manager of the Audit Company of New York, who died last week after a brief illness, was a man of exceptional attainments in the field of expert accounting and auditing. At the same time his knowledge of railway and corporation finance was thorough and accurate. For two years he was a frequent contributor to THE INDEPENDENT upon financial topics. He was notably conscientious in his view of an examining auditor's duty and responsibility with respect to corporation prospectuses and reports.

Vol. LVI NEW YORK, THURSDAY, APRIL 14, 1904 No. 2889

Survey of the World

Municipal Ownership in Chicago

At the election in Chicago on the 5th inst., the Mueller Street Railway act was accepted, and other propositions in favor of the municipal ownership of the city's railways were supported by very large majorities. This Mueller law, enacted by the Legislature in May, 1903, empowers any city in Illinois to "own, construct, acquire, buy and operate" the railways in its streets. It is not in force in a city until it has been accepted by a majority vote. Thereafter, any project of municipal operation must have the approval of three-fifths of the votes cast. Ordinances renewing old leases or making new ones for a term of more than five years are subject to a referendum vote. At last week's election the law was accepted by a vote of 152,434 to 30,104. Upon the question whether the Council should proceed without delay to acquire ownership of the street railways there were 120,744 votes in the affirmative, against 50,893 in the negative. Upon another question, "Shall the Council, instead of granting any franchises, proceed to license the street railway companies until municipal ownership can be secured, and to compel them to give satisfactory service?" the vote was 120,181 to 48,056. With respect to these last two questions the vote is not mandatory, but does express the force of public opinion in favor of municipal ownership. The franchises of one or two companies have recently expired; those of the others will soon be terminated. The city cannot raise the money to buy the railway property without a new grant of power from the State. The recent votes will serve to enable the city to make terms with the companies upon the basis of temporary licenses or short extensions of franchises. This appears to be the policy of Mayor Harrison, who says: "The unsatisfactory condition of Chicago's civil service, which of late has given rise to a succession of serious scandals, indicates that the addition of 10,000 street car employees to the municipal pay rolls would be injurious to the city government, and would not render less acute the existing evils of the traction system." The car service has been wretched, and the demand for municipal ownership is due in part to this fact and in part to a record of corruption in the past, a record which the acts of a dishonest Council and a weak Legislature (as in the case of the notorious Allen bill) have been prominent. A large majority of the present Council deserve the confidence of the people, and, so far as practicable, will act in accordance with last week's expressions of public opinion at the polls. Upon the question whether members of the Board of Education should be elected (instead of being appointed by the Mayor) the vote was 115,553 to 58,432.

Politics and Legislation

Opinions differ as to the effect of Mr. Cleveland's interview in support of Judge Parker's candidacy. That it excites opposition to the Judge in the Northwest and parts of the South is admitted; in the Northeast, however, it commends him to those followers of the ex-President who have feared that the Judge would be controlled by ex-Senator Hill. Mr. Cleveland said that the movement for Judge Parker afforded him

"the greatest possible relief and satisfaction," not only so far as his own personal comfort was concerned, but as a Democrat anxious for his party's supremacy "and delighted with the prospect of its return to sanity and patriotic effort." The Judge, he added, was a fit representative of "safe and conservative Democratic principles," and "the conservative element of the party" would "control at St. Louis." Mr. Bryan leaves no room for doubt as to his attitude toward the Parker movement. He says:

"It can be safely taken for granted that in case of Judge Parker's nomination and election, Mr. Hill would be the controlling figure in the administration; and that would mean that those who attempted to reach the White House would have to wade through peanut shells knee deep. Mr. Hill stands for everything bad that Mr. Cleveland stands for, and lacks the brutal frankness that has given Mr. Cleveland most of his popularity. But Mr. Hill's support, dangerous as it is, is not so detrimental to Judge Parker as the corporate support which is gradually gathering about him. . . . If Mr. Parker is nominated it must not be as a 'harmony' candidate—it must be with the knowledge that he represents the same element, the same influence and the same methods which during Mr. Cleveland's second administration led the Democratic party through 'the valley of the shadow of death.'"

Mr. Bryan thinks that Judge Parker would appoint "corporation men" to the Supreme Court, where they would stand with "the three judges appointed by Mr. Cleveland," who dissented from the decision in the Northern Securities merger case.—Instructions for Mr. Hearst were not given in the Kansas convention, but he claims 12 of the 20 delegates. The resolutions commend him "to good Democrats everywhere," and indorse the national platforms of 1896 and 1900.—It is understood that ex-Secretary Root will be the temporary, and Speaker Cannon the permanent, chairman of the Republican National Convention.—Ignatius A. Sullivan, who was elected Mayor of Hartford, Conn., two years ago by the labor unions and Democrats, was defeated for re-election last week by Judge Wiliam F. Henney, Republican, whose plurality was 550 in the heaviest vote ever cast in the city. In Grand Rapids, Mich., the recent disclosure of much municipal corruption has caused a political revolution, Republicans yielding to a Democratic majority of 900.—In the House the Committee on Irrigation opposes, by a vote of 8 to 3, the repeal of the desert land law. George H. Maxwell testified that for five years past the five transcontinental railroad companies had contributed $30,000 annually to the fund used by the National Irrigation Association, and that $20,000 had been added each year from other sources. The money was used to secure the passage of the irrigation law by a campaign of education. It had been said that these railroad companies desired that the desert land law be repealed in order that the value of their lands might be increased, but Mr. Maxwell denied that they directed the policy of his Association.—Consideration of impeachment proceedings in the case of Judge Swayne has been postponed until December 13th, and the Judiciary Committee has been authorized to take further testimony.

Mr. Hearst and the Coal Railroads

An important decision, broadening the powers of the Interstate Commerce Commission and sustaining the contention of William R. Hearst in his suit against the anthracite coal railroad companies, has been announced by the Supreme Court. Mr. Hearst first sought to induce the Government to prosecute the companies under the Anti-Trust law. The evidence he offered was submitted to Mr. Knox, in October, 1902, by District Attorney Burnett. No action was taken. Mr. Hearst then filed with the Interstate Commerce Commission a complaint, alleging that the companies, by means of their contracts with their subsidiary coal corporations and in other ways, were violating the Interstate Commerce law. At the ensuing hearing, the companies refused to produce the contracts in question. This refusal having been submitted to the Circuit Court, Judge Lacombe sustained the companies. His decision has now been reversed (on appeal) by the Supreme Court, all the Justices concurring except Justice Brewer, who dissented but offered no opinion. The court holds that it has jurisdiction and that the allegation that Mr. Hearst himself had suffered no damage is irrelevant. The Commission,

it says, has a right to know how the interstate traffic of railroads is conducted, the relations between them and the shippers, and the rates charged and collected. It sees no reason why the companies should be permitted to withhold the contracts and agreements in question. The argument that the Temple Iron Company contracts tend to show pooling in violation of the law has, the court says, a legitimate bearing upon the question. (Judge Lacombe had said that these would be relevant if the prosecution were under the Anti-Trust law.) It is clearly established by this decision that complaint may properly be filed by any citizen, and that the Commission must investigate, if such complaint relates to matters within the scope of its powers; also, that railroad companies must produce their contracts and books when the Commission calls for them. The Commission will not hereafter be compelled to use the methods of the detective in searching for evidence as to railroad contracts and agreements. The interrupted hearing will soon be resumed. Commissioner Prouty says that if the evidence should show a violation of the Anti-Trust law, the facts would be reported to Attorney-General Knox. Mr. Hearst's newspapers and friends have made all possible use of this decision in support of his candidacy for the Democratic Presidential nomination. In the House, Mr. Hearst has introduced a resolution calling upon Mr. Knox for the evidence submitted by him in 1902 as to an alleged violation of the Anti-Trust law by these railroad companies, and for District Attorney Burnett's report upon it. With the decision in this railroad case the Supreme Court handed down another, sustaining the validity of an ordinance of the Chicago Council, reducing the price of gas to 75 cents per thousand feet. In the litigation leading up to this decision, Mr. Hearst and his newspapers in Chicago had been actively interested in opposition to the combination of gas companies.

Senator Burton Sentenced

Senator Joseph R. Burton, of Kansas, convicted upon the charge that for pay he had exerted his influence at the Post Office Department in behalf of the Rialto Grain and Securities Company, was sentenced in St. Louis by Judge Adams, on the 6th, to be imprisoned in jail for six months and to pay a fine of $2,500. He is also disqualified for holding any Federal office. The judge said a careful review of the evidence had satisfied him that the jury had rendered a just and true verdict. He continued:

"Your conviction necessarily results in your punishment, but its importance, in my opinion, is not confined to its effect upon you. Your exalted station in life and the character of your offense give unusual significance to your conviction. It demonstrates that the law of the land is equal to any emergency and that it can be administered regardless of the personality or station of the accused. It also demonstrates to all the people that public office cannot be prostituted to self-serving purposes, and that public office is not a sure or safe passport to private thrift. The humiliation attending your conviction and the statutory disqualification resulting therefrom, which for ever incapacitate you from holding any office of honor, trust or profit under the Government of the United States, are in themselves heavy punishment for your offenses, and leave but little in the way of severity which could be added. It is neither my pleasure nor purpose to impose any unnecessary punishment. I think the majesty of the law will be sufficiently vindicated and the public welfare sufficiently safeguarded by imposing a single sentence, warranted as it is, on any one of the six counts of the indictments on which you were convicted."

A bill of exceptions was at once filed, and Mr. Burton gave bonds in $10,000, pending an appeal. On the 8th he returned to Washington, but did not take his seat in the Senate. If he should attempt to do so, a resolution of expulsion would be introduced. Some Senators hope that he will resign. It is said, however, that he will attempt to hold his office until the final decision in his case, on appeal, and that the Senate in the meantime will take no action, if he is not seen in his seat.

Census Estimates for 1903

Having decided to make annual estimates of population, in order that there may thus be established a basis for the computation of death and birth rates, the Census Bureau has issued a bulletin of estimates for the year 1903. According to this statement, the population of the United States, not including Alaska or the islands, was 79,900,389, which shows an increase of

nearly 4,000,000 since 1900. The estimates are based upon the assumption that the annual increase is one-tenth of the decennial increase between the last two censuses. By various tests this method appears to be more accurate than any other. New York leads the list of States, with more than 7,500,000; Pennsylvania's population exceeds 6,500,000, Illinois has passed 5,000,000 and Texas, displacing Missouri, has more than 3,000,000. In estimating the population of cities, allowance has been made for changes in area reported in answer to the Bureau's inquiries. New York in 1903 had 3,716,139 inhabitants; Chicago, 1,873,880; Philadelphia, 1,367,716. St. Louis had just passed and Boston had almost reached the 600,000 mark; Baltimore had 531,313; Cleveland was far in advance of Cincinnati (414,950 and 332,934, respectively); Buffalo had 381,403; San Francisco and Pittsburg were close competitors (355,919 and 345,043); Detroit, Milwaukee and New Orleans had just passed 300,000, and Washington had almost reached those figures. Of the entire population, 25,806,987 persons (an increase of 1,759,620 in three years) were assigned to the 438 cities and towns of more than 10,000 inhabitants. Massachusetts was first in the number of such cities and towns, having 47, with a population of 2,197,706. Almost exactly one-half of the urban population was in the North Atlantic States; nearly one-third of it was in the North Central States. During the last three years 37 per cent. of the cities have annexed suburban territory. In Mississippi, Vermont, North Carolina, South Dakota, Wyoming and Oklahoma there is no city having a population of 25,000.

Polygamy Again Forbidden

Polygamy, or "plural marriage," has again been formally prohibited by the Mormon Church. Just before the close of the annual conference of the Church, in Salt Lake City, on the 6th, and in the presence of the 5,000 Mormons who thronged the Tabernacle, President Joseph F. Smith read the following statement:

"Inasmuch as there are numerous reports in circulation that plural marriages have been entered into, contrary to the official declaration of President Woodruff of September 26th, 1890, commonly called the Manifesto, which was issued by President Woodruff and adopted by the Church at its general conference on October 6th, 1890, which forbade any marriages violative of the law of the land, I, Joseph F. Smith, president of the Church of Jesus Christ of Latter Day Saints, hereby affirm and declare that no such marriages have been solemnized, with the sanction, consent or knowledge of the Church of Jesus Christ of Latter Day Saints, and I hereby announce that all such marriages are prohibited; and if any officer or member of the Church shall assume to solemnize or enter into any such marriage he will be deemed in transgression against the Church and will be liable to be dealt with according to the rules and regulations thereof and excommunicated therefrom."

Thereupon Apostle Lyman offered a resolution declaring that the members of the Church, in general conference assembled, approved this statement and would support the courts of the Church in enforcement of it. Among those who spoke for the resolution (which in due time was adopted by unanimous vote) was Brigham H. Roberts, who was excluded from the House of Representatives. There never had been, he said, any compact between the Church and the Government, but one had been made between the State and the nation at the constitutional convention. In his opinion, the Church ought to approve that compact and also that part of the Constitution that prohibits plural marriages. It is pointed out by the Gentiles that the statement or declaration was signed and the approving resolution proposed by officers of the Church who recently testified at Washington that for some years past they had been practicing polygamy in violation of the laws of the State and the rules of the Church, and that it was their purpose to continue to do so; also, that these offending officers were sustained at the recent conference without a dissenting voice. At the Republican State convention, on the 8th, control was easily exercised by the faction of which Senator Reed Smoot is the leader. The delegates were instructed to vote for Mr. Roosevelt.

Cuba and Other Islands

At the beginning of the session of Congress in Havana, on the 4th, there was no quorum in the House, owing to the absence of the Nationalists, who

feared that the many contests in which they are interested would be decided against them if they should take part in the proceedings. To the courts 658 disputes arising out of the recent elections have been referred. There was great disorder in the House, and several politicians have been arrested. In his message, which was read to the Senate, President Palma explained that three months would be required for the examination and adjudication of disputed claims for army pay. The distribution of the $31,675,000 realized from the new loan will therefore be delayed. The public health has been excellent; the death rate having been only 20.82 in Havana (the lowest for 80 years), and not more than 15 for the entire island. No case of yellow fever or smallpox originating in Cuba was reported during the year. Statistics indicating prosperity were cited. There has been a great increase of the sugar crop; in two years the number of cattle has risen from 953,000 to 1,223,000. Exports of sugar have increased by $10,000,000; those of fruit by $950,000. The President hopes that the new agricultural experiment station, of which an American is director, will tend to diversify the agriculture of the island. He recommends an annual appropriation of $2,000,000 for the improvement of roads, and an increase of the Rural Guard from 3,000 to 4,000 men.—No action will be taken at Washington upon the Isle of Pines treaty before the end of the present session.—It is reported that Governor Hunt, of Porto Rico, will be appointed a judge of the District Court to succeed Judge Knowles, of Montana, who is soon to retire on account of his age. —The bill recently passed by the Senate, applying our coastwise navigation laws to trade between the Philippines and the States on and after July 1st, 1905, was passed in the House last week with an amendment changing the date to July 1st, 1906. Another proposed amendment deferring the application of these laws until 1909, was lost by only 4 votes. It is understood that prominent Republicans in Congress have promised to use their influence to secure a reduction of the tariff on Philippine products before the restrictions of this bill are imposed.

The Anglo-French Treaty

One of the greatest diplomatic triumphs of the century is accomplished in the agreement signed on April 7th between France and England, by which all the points of difference between the two nations in regard to their colonial interests have been settled by purely peaceful negotiation and mutual compromise without threat of war and without calling in any other nation or international court as arbiter. The agreement is received by almost all parties of both countries with remarkable unanimity of satisfaction, and Lord Lansdowne and M. Delcassé are universally applauded for their successful settlement of these long standing quarrels. It is understood that both King Edward and President Loubet exerted strong influence in favor of the agreement. The treaty comprises three separate instruments; one relating to Egypt and Morocco, one with Newfoundland and West Africa, and the third with Siam, New Hebrides and Madagascar. France is given practically a free hand in Morocco, with the exception that no fortifications are to be erected opposite Gibraltar, between Mellila and the mouth of the Sebu River. This will doubtless result in the establishment of a French protectorate over Morocco in spite of Spain, and opens the Empire of the Sahara to the Atlantic. France withdraws her protest against the British occupation of Egypt, and permits the money which has accumulated through Lord Cromer's administration, amounting to some $30,000,000, to be used for railways and irrigation works for the development of the country. Equal trade privileges are guaranteed in both Egypt and Morocco for thirty years. Great Britain guarantees the neutrality of the Suez Canal. France renounces her exclusive rights of fishing on the French shore of Newfoundland, but retains the right to fish for cod and lobster and to clean and dry fish ashore and to buy bait. The amount of indemnity to be paid to establishments on the French shore is to be settled by a

joint arbitration commission. In West Africa, France obtains a better route between the Niger River and Lake Tchad, the port of Yarbatenda on the Gambia, and the six Los Islands. The agreement of 1898 as to Siam is confirmed and made more definite, a joint commission will settle the land disputes in the New Hebrides, and Great Britain withdraws her protests against the French economic *régime* in Madagascar.

M. Combes's Triumph

The anti-clerical program of the Cabinet has been carried through the Chamber of Deputies without serious modification and there is no doubt that the bill will pass the Senate in its present form. The final vote in the Chamber on the whole bill was 316 to 269. As it now reads it prohibits the religious orders from engaging in teaching of any grade or kind in France. Ten years is allowed for the complete change from religious to secular schools and the religious schools are allowed to continue in the colonies, altho they may be closed there at any time by executive order. The congregations are to abolish their novitiates, except in so far as it may be necessary to keep them to train teachers for the colonial schools. The property of the teaching orders will be taken in charge by Government commissioners. Two days were given up to a fierce attack on M. Pelletan, Minister of Marine, on the ground that he intentionally or through inefficiency had allowed the navy to deteriorate and brought the service into disrepute. M. Pelletan offered to stand the criticism alone, but the Premier supported him and insisted on making it a Government issue, proposing that a commission be appointed, composed of non-partisan naval experts, to investigate the administration of the department under M. Pelletan and his predecessors. This was passed by the usual majority after the debate, and the Chambers adjourned till May 17th. The Government has taken advantage of the recess to promulgate the order, so long pending, to remove from the law courts the crucifixes and religious pictures, which in France are always seen on the walls above the judge's bench. This has roused great opposition among the people, and in some places the workmen have refused to take down the religious emblems. Among them are some of great artistic value, especially the picture of Christ on the Cross by Bonnat in the Assize Court, and a triptych ascribed to Memling, painted for Louis XI in 1476.

Spain

When it was announced that in his royal progress through his kingdom Alfonso would visit Barcelona there was fear lest an attempt to assassinate him would be made by some of the numerous anarchists in that city. The Conservative government under Señor Maura has put down strikes and riots with an iron hand. Deputies who attended a public meeting in commemoration of the republic were arrested, and the cry of *Viva la Republica* declared seditious and punishable, notwithstanding which decree the Republican deputies in Congress interrupted the session for many minutes with the prohibited cry. Since the Premier was to accompany the young King on his visit to Barcelona some manifestation of popular hatred was to be expected, but it is not certain that there was anything worse than hooting of Señor Maura and some rioting. There was a violent explosion while the King was passing through the streets, and it was telegraphed everywhere that an anarchist bomb had been thrown at the King, but this was officially denied and the explanation given out that it was the accidental explosion of gas works. Queen Isabella, grandmother of Alfonso, died in Paris on Saturday of the grip. She was the daughter of Ferdinand VII of Spain and was proclaimed Queen on his death when she was only three years old, in contradiction to the Salic Law. The Carlist rebellion broke out at once and her reign of thirty-five years was a troublous one, ending in the republic of 1868, when she was driven from the country. Her youngest daughter, Infanta Eulalie, visited the United States and was made much of at the time of the Columbian Exposition.

Peace in the Balkans

As far as diplomatic measures can insure it there will be peace in the Balkans this spring. With the suddenness of a summer sky all signs of a storm are cleared away. Turkey and

Bulgaria have come to terms; amnesty is granted; the reorganized police force will take charge of Macedonia; the Albanians are pacified; Boris Saraffof is quiescent. According to the convention signed between Turkey and Bulgaria on April 8th, amnesty is granted to all Bulgarians concerned in the Macedonian insurrection of last summer, except persons guilty of using dynamite, and Bulgarian trade and travel will no longer be interfered with or restricted by Turkey. On the other hand, Bulgaria is to put a stop to the organization of revolutionary raids on her territory and the smuggling of arms across the frontier into Macedonia. The opposition, which the Porte has offered to almost every detail in the execution of the Mürzsteg program by which the Macedonian *gendarmerie* was to be placed under the joint control of Austria and Russia, is suddenly withdrawn, ostensibly on account of the long and conciliatory note in which the two Powers explained the provisions of the convention, and how it is proposed to enforce it. It was agreed in deference to Turkish objections that no more than 60 foreign officers shall be engaged, and that, in exercising the right of discharging from the service any Turkish officers or men who were disobedient or inefficient, General de Georgis, the Italian chief of the *gendarmerie,* shall act through the Turkish authorities. The Sultan has conciliated the Albanians by abrogating the unpopular cattle tax, and removing Shemsi Pasha, whose harshness and cruelty aggravated the difficulty. It is reported that the Turkish loss in the recent outbreak was about a thousand and the Albanian 480 men. Shakir Pasha, with 12 battalions, is still at Baba Tepe.

The Russo-Japanese War

The first chapter of war history is closed this week by the completed occupation of Korea by the Japanese. It could hardly have been expected that, just two months after the outbreak of hostilities, Japan should possess herself of the land which for many centuries she had so long desired and so often fought for, and that this should be accomplished without a serious battle and with the loss of only a few men. The fifty, sixty or seventy thousand men which we were told were being poured into Korea by Russia have mysteriously vanished, and nothing has been found of the fortifications, which the Russians were said to have constructed in the fastnesses of Northern Korea. The first division of the Japanese army, consisting of 45,000 men, was concentrated at Anju to march on Wiju by three different routes, but on reaching this port they found it empty and undefended. They have now occupied the Korean side of the Yalu without opposition and are landing supplies at points well up from the mouth. This indicates that the Russians are not attempting to defend the Manchurian shore, but have established their line of defense on the higher ground at some distance further west. How far they will carry this policy of retreat, which served them so well against Napoleon, remains to be seen. So far the Japanese advance has been parallel with the coast, and since they have had undisturbed possession of the sea, troops and supplies were landed at the ports on the west of Korea exactly when and where they were needed, and at some points conveyed up the rivers into the interior. From Chinampo, which has recently been the important receiving port, a light draught steamer passes up the river to within five miles of Ping Yang, the military center, where there is a pontoon bridge. A second and a third Japanese army are in motion, but whether they will follow the first into Korea, or will land at Taku-Shan west of the Yalu or at Niuchwang is purely a matter of speculation. The Japanese censorship is strict, all letters from Seoul are opened, and no foreign correspondents are yet allowed at the front. General Kuropatkin has visited Niuchwang, where he reviewed 4,000 troops and inspected the new fortifications. There are said to be 30,000 troops now within easy marching distance of Niuchwang, and the harbor, which is merely the Liau River, is thoroughly protected by mines and by fortifications on both banks.

Kongo Atrocities

The complaints of misgovernment and abuse of the natives by the authorities of the Independent State of the Kongo, which were made by both missionaries and traders, among them Reverend Dr. Morrison, from whom an early account was published in THE INDEPENDENT of July 9th, and another article from the same writer in THE INDEPENDENT of December 3d, were met with the general denial on the part of the Kongo Government, in which it was claimed that there was no severe oppression of the natives, and only such occasional abuses of authority as are inevitable in governing a barbarous people. It was stated that the labor required of the natives amounted to no more than forty hours' work per month, which was paid for, and that this represented what in more civilized communities is the money tax for the support of government; that the African natives were naturally lazy and could only be civilized by first being taught to work. To get direct and indisputable evidence of cruelty practiced upon the natives, Mr. Casement was directed to investigate the conditions in the Kongo region. His report has just been published by the British Government, and from this we make the following extracts. Mr. Casement reports a number of instances coming under his direct observation of the practice of cutting off the hands of natives, as shown in the photograph published by us last summer.

"Perhaps the most striking change observed during my journey into the interior was the great reduction observable everywhere in native life. Communities I had formerly known as large and flourishing centers of population are to-day entirely gone, or now exist in such diminished numbers as to be no longer recognizable. Where formerly had stretched these populous native African villages, I saw to-day only a few scattered European houses, belonging either to Government officials or local traders.

"At F—— I spent four days. I had visited this place in August, 1887, when the line of villages comprising the settlement contained from 4,000 to 5,000 people. Most of these villages to-day are deserted, the forest having grown over the abandoned sites, and the entire community at the present date cannot number more than 500 souls."

"Steaming up a small tributary of the Lulongo, I arrived, unpreceded by any rumor of my coming, at the village of A——. In an open shed I found two sentries of the La Lulanga Company guarding fifteen native women, five of whom had infants at the breast and three of whom were about to become mothers. The chief of these sentries, a man called S——, who was bearing a double-barreled shotgun, for which he had a belt of cartridges—at once volunteered an explanation of the reason for these women's detention. Four of them, he said, were hostages who were being held to insure the peaceful settlement of a dispute between two neighboring towns, which had already cost the life of a man. The remaining eleven women, whom he indicated, he said he had caught, and was detaining as prisoners to compel their husbands to bring in the right amount of india rubber required of them on next market day. When I asked if it was a woman's work to collect india rubber, he said: 'No; that, of course, it was man's work.' 'If I caught and kept the men, who would work the rubber? But if I catch their wives, the husbands are anxious to have them home again, and so the rubber is brought in quickly and quite up to the mark.' When I asked what would become of these women if their husbands failed to bring in the right quantity of rubber on the next market day, he said at once that they would be kept there until their husbands had redeemed them. Their food, he explained, he made the chief of A—— provide, and he himself saw it given to them daily."

"On a Sunday in August I saw six of the local sentries going back with cap guns and ammunition pouches to E——, after the previous day's market, and later in the day, when in the factory grounds, two armed sentries came up to the agent as we walked guarding sixteen natives, five men tied neck by neck, with five untied women and six young children. This somewhat embarrassing situation, it was explained to me, was due to the persistent failure of the people of the village these persons came from to supply its proper quota of food.

"The agent apologized to me for his inability to give me meat during my stay, pointing out the obvious necessity he now was under of catching some persons without delay. He should certainly, he said, have to send out and catch women that very night."

The authorities of the Kongo State have issued a reply to Mr. Casement's charges, in which they question his fairness and reliability, and explain the decrease in population in certain districts by attributing it (1) to the sleeping sickness, (2) epidemics introduced by the Europeans and (3) to the abolition of slavery.

The Yellow Peril

BY ARCHIBALD R. COLQUHOUN, F.R.G.S.

[The following article, by one of the greatest living authorities on Far Eastern questions and the author of many books and articles on China, Japan and Siberia, takes about the same view of the "yellow peril" that THE INDEPENDENT took a few weeks ago in an editorial on the same subject. We are pleased to say that we expect to print several more articles from Mr. Colquhoun on kindred topics.—EDITOR.]

THERE are many people who, despite an entire sympathy with Japan in her reasons for declaring war, are still possessed by a lurking fear lest any great degree of success might make her a dangerous factor in world politics. In a word, the "Yellow Peril," that bogy embodied by the German Emperor in a world-famous cartoon, is at work among us, even among the people who have been first and foremost in urging the yellow peoples to adopt a Western civiliation.

It may be said at once that these doubts and fears as to the aggrandizement of a yellow race are not, on the surface of things, without foundation. One of the principal aims of Japan in the present conflict is to bind China to her, by fetters too strong to be broken, and there is a shrewd suspicion that in so doing she is actuated by something more than a mere desire to save the yellow races from domination by the white. To the conquering Slav, Teuton or Anglo-Saxon this may seem a dangerous doctrine, tho he can hardly count it an unreasonable one.

Let us see what progress Japan has made toward effecting the moral union which must be the foundation of any Pan-Mongol union. Interesting data on this point are supplied by a recent report of the "Society for the Diffusion of Christian and General Knowledge Among the Chinese." This society, by adopting a broad-minded view of Chinese needs, is accomplishing a little-noticed but very important work. It numbers some of the most distinguished Americans and Englishmen in China among its members, and altho some of the ablest Christian missionaries are among them, the work of the society is quite as much secular as religious, its aim being to enlarge the horizon of the Chinese and teach him to rise above the ignorant provincialism which is his bane.

Among the most interesting details of the work accomplished is the fact that thirty-five complete sets of the "Encyclopædia Brittanica" were sold to Chinamen in Shanghai, and had there been a Chinese translation hundreds of copies could have been disposed of. Still more remarkable are the examples given of questions, taken from various provinces, of examination papers set for the *Chu Jên,* or M.A. degree. In Kinagsi the students were asked to explain Free Trade and Protection—a question which very few M.A.'s in Britain or the United States would care to tackle at this moment. They were asked also, What is the bearing of the Congress of Vienna, of the treaty of Berlin, and of the Monroe Doctrine on the Far East? Wherein lies the naval supremacy of Great Britain? What is the bearing of the Siberian Railway and Nicaragua Canal on China? In Shantung: Define the relations of land, labor and capital. How best to develop the resources of China by mines and railways? How best to modify the civil and criminal laws in order to regain authority over those now under extra-territoriality privileges? In Fukien: Which Western nations have paid most attention to education, and what is the result? What are the government, industries and education of Switzerland, which, tho small, is independent of surrounding great Powers? In Kwangtung (Canton): How to promote Chinese international commerce, new industries, and savings banks, versus the gambling houses of China? In Hunan: What is the policy of Japan—only following other nations or what? In Anhui: How do foreigners get faithful men for their Government services?

Some of these are taken from the pamphlets issued by the society, but that such subjects should appeal to the *literati*

of China as worthy of study is in itself an eloquent commentary on the spirit which is at last awaking in China. As regards this spirit the society speaks with evident diffidence, disclaiming any responsibility for having "stirred up reform." Reform is in the air; China is seething with it, they say, and we are but endeavoring to turn it into favorable channels. Whence has come this spirit, so long lacking, despite the labors of many Europeans in the missionary field? I have no hesitation in saying that it is Japan that has breathed a new life into the decaying civilization of China.

The Japanese reformer in China is, of course, possessed of many advantages over his Western compeers. One of the most powerful weapons he has wielded has been the press, of which, tho so recently introduced in his own country, he had already learned the use in reaching people who would otherwise be outside the range of his possible influence. Before 1895 there were no newspapers in China save the English ones, one Ger-

ARCHIBALD R. COLQUHOUN.—Courtesy Harper & Bros.

man, and a few missionary sheets in Chinese, issued for the purpose of religious propaganda. The Reform movement of 1896-98 gave birth to a large number of newspapers in Chinese, generally of a revolutionary character, followed by others in French, German and Russian, which, however, had little effect on public opinion. The Japanese opened a new era by publishing in Pekin, Tientsin, Shanghai, and even in the interior, papers which, altho in the Chinese language, gave a view of Japanese development and of Western civilization from an Oriental point of view. It is obvious that these papers were likely to achieve greater popularity than any previously issued, and their influence has no doubt been enormous.

The practice of sending Chinese students to Tokyo (of whom there are already more than 1,000 in Japan, some of them supported by provincial subscriptions) and of obtaining Japanese teachers in many branches of education has increased rapidly, and Japanese have replaced the British or American teachers in most of the colleges. The visits paid by Chinese princes to foreign countries have inaugurated a new era in the history of the nobility. Formerly the reports of the Ambassadors abroad or of such Chinese officials as visited Europe or America were treated with indifference or contempt by the ruling Manchus, but this will hardly occur again now that Prince Chun has visited Germany (altho on an unpleasant mission) and that Prince Chen has been to England to attend the coronation, has patronized the Osaka exhibition, and has inspected the various institutions of Japan. Even the Mongol Princes have taken to traveling, and Japan is the Mecca to which their footsteps tend. We hear that a Chinese Prince is to go to the St. Louis Exhibition; so that East and West are indeed meeting at last! Several sons of high families have embraced the opportunity offered by the legations in Washington and London to gain acquaintance with the West and study the English language, and a very different fate awaits them from that which used to befall the unfortunate men who formerly, at great pains, acquired this knowledge. The most he could hope for in the old days was to become interpreter to a vice-regal yamen, and he was *persona grata* to neither his own people nor the foreigner.

Another powerful element in spreading knowledge has been the extension of the postal system throughout China. Newspapers, magazines and even books now penetrate to the remotest part of the empire—a reform due to the organization of Sir Robert Hart; so that Japan must not receive all the credit.

Can anything be more significant than one of the examination questions quoted: "Is Japan merely following other nations?" Here to my mind lies the secret of her success in fanning the embers of reform to a blaze. The intense pride of race which animates the Chinaman made it difficult for him to accept the *rôle* of imitator of the Western peoples, whom he regarded as barbarians, despite their superior equipment in practical matters. His first conception of Japanese renascence was that she was a mere pupil, to be tied to the chariot wheels of her teacher. Japan has now taught him otherwise.

It is customary for us to speak as if Japan in adopting a Western civilization had, in fact, sunk her own personality; but it is becoming increasingly evident that this is not the case. Her views of Western affairs would probably surprise and scandalize a good many of the people who have been wont to patronize her as an apt and intelligent pupil. Having grasped the world-conditions in which she was to play a part, she set about equipping herself for the *rôle* she desired to play; but her avowed ambition to be quit of leading strings at the earliest opportunity, the reticence and independence of her attitude and the steadiness of her aim have indicated clearly enough that she had no intention of becoming a mere Westernized appendage of the European or American continents. As a matter of fact, Japan, despite the adoption of Western dress by her Government, despite the organization of an army and navy on (improved) European standards—despite everything she has done to make herself efficient as a nation—has not adopted Western civilization *en bloc*. Her ideals, her sympathies, her attitude toward the great central facts of life remain what they were. The Japanese is

no travestied Westerner; he remains true to himself, to his race, to his traditions, while conforming to the demands of a dominant civilization.

He is teaching China this view of reform, and it is not a matter for wonder that some of the keenest foreign observers in China are rather uneasy as to the results of the lesson. It is certain that thus, and thus only, can the barrier of Chinese obstructiveness be overcome; but whether the results will be favorable to Western influences is extremely doubtful. From the point of view of the Christian missionary it is more than doubtful. Japanese influence makes rather for religious indifferentism than for any creed, but an association has been already formed of those who are professedly Buddhistic in religion and pro-Japanese in politics. It is the presentation of educational projects, either under the sanction of a common religion or from a purely scientific, utilitarian and frequently agnostic platform, which gives the Japanese their second strong hold upon the attention of the people.

The general opinion among the best informed on Chinese subjects is that the people are fast ripening for radical changes, and when we remember the extraordinary revolution wrought in Japan in a few years we need not be surprised at the quick growth of reform feeling in China. A large number of the older officials, particularly the nobles, are not in sympathy with the movement, which, they know, would be the death-knell to their pretensions and monopoly of political power. Nevertheless, they are to a growing extent pro-Japanese, being, indeed, between the devil and the deep sea, since foreign nations threaten them on the one hand and their own people on the other. In Japan they see the savior of China from rapacious Europe, but at the same time they dread the revolution she is working up in the long-suffering Chinese.

A very notable change has recently been taking place in the sentiments of the Chinese Government and people toward Russia. The machinations of Japan have effected their object in opening even Manchu eyes to the true nature of the "friendship" on which Li-Hung-Chang had taught them to lean. Occurrences in Mongolia and Tibet have given them grave cause for alarm, for they are perfectly aware that in losing control of Lhassa and opening the door to Russia they were forfeiting something far more important than a mere outlying dependent state of little economic value. The present move of the British into Tibet—a technical violation of territory which we had on a previous occasion evacuated rather than offend Chinese susceptibilities—comes at an auspicious moment for the rehabilitation of British prestige in Chinese eyes, and at the same time, taken in concurrence with Japanese successes on the seaboard of Manchuria, will turn the tide of feeling strongly against Russia. Nothing succeeds like success, and the opportunism which is the only policy left for a distracted China will lead her at a moment's notice to reverse a policy which has led to the present imbroglio. Unfortunately for the aspirations of anti-Western Chinese reformers (an expression which would have been impossible a few years ago, when reform and Westernization were synonymous terms), there are in the vast Chinese empire too many points of contact with Western nations, more particularly with Russia, to permit her to work out her salvation on independent lines like insular Japan.

It is for this reason that I am not by any means appalled by the prospect of the Yellow Peril. Were China a continent by herself, were there no great British empire in Asia, no vast American republic on the other side of the Pacific, no Holy Russian empire, no progressive Germany, no Suez or Trans-isthmian canal—in short, could we put back world-conditions for many centuries—I could feel, as felt Western civilization, a genuine thrill at the prospect of invading Mongol hordes—innumerable, invincible, sweeping across Europe like devouring locusts.

Personally, I consider the Japanization of China preferable to that partition which has so long been hanging over a moribund empire. If the Japanese can succeed in galvanizing China into life, it will be more to our advantage than if the European situation continued to reproduce itself, with alarming variations in the balance of power, in and around the Pacific. Whatever may be the ultimate

trend of her civilization, we have no reason to believe that Japan's influence will be exerted to our detriment. An insular people, reproducing in many features the situation of Britain, she is still debarred by world-conditions from following the British path of colonization and world-empire. Her avowed policy to preserve China intact and to open her to the commerce of the world is precisely our own, only she endeavors to obtain her objects by strengthening China, whereas certain of the Western Powers tried to achieve this by a process of exhaustion. The fears of an industrial invasion by the yellow man are better founded, but it must not be forgotten that the civilization which renders him efficient will in time bring its own nemesis by raising the standard of living, so that the principal objection to Oriental labor will be done away with. Meanwhile, we are able to protect ourselves by extraneous measures, which, however lacking in logic, are still effective from our own point of view.

Notwithstanding this optimistic view of Japan's mission in China, it is my earnest conviction that the Anglo-Saxon peoples cannot afford to be quiescent in the near future, if they desire to preserve intact the interests they have created. Japan will not be their cat's paw. They will have to take a hand themselves to get their chestnuts out of the fire. At any moment the death of the Empress-Dowager, the outbreak of revolution or the fortune of war might create a situation of the greatest delicacy in the Far East, and in any case the conclusion of the war, whatever its issue, will leave a host of points to be settled, in which Britain and America are deeply interested. It would be well if both countries were agreed as to the main lines of policy in any contingencies which may conceivably arise, so that they shall be able, in co-operation, to take up a firm attitude on disputed points and thus to guard against dangerous regrettable eventualities.

LONDON, ENGLAND.

Why Municipal Reform Succeeds in Chicago and Fails in New York

[To show the contrasts between New York and Chicago politics we print the two following articles under this single title. The first is written by a New York man and the second by a Chicago man. Both have thorough and intimate knowledge of the reform movements in their respective cities and both are settlement residents and political workers. They agree in a very significant way as to the fundamental causes as to Chicago's municipal progress as evidenced by last week's election and New York's recent backward step.—EDITOR.]

NEW YORK

CHICAGO is on the road to genuine democratic government. For the second time a direct vote of the people has been taken on the greatest of municipal issues: Shall the city own its transportation facilities? As before, the people have shown their belief in the direct democratic government by piling up 171,000 ballots and their confidence in their ability to run their own affairs by voting in favor of municipal ownership by a majority of 70,000. They also voted by a majority of two to one in favor of democratic government of the schools—the direct election by the people of the members of the Board of Education, instead of their appointment by the Executive.

This vote was not a vote for a "business administration." It was a radical vote in favor of direct legislation by the people, of direct election of public officials, instead of appointment, and of public ownership of public utilities—the three essential planks of every radical municipal program.

Only a few months ago New York "Reform" had an overwhelming defeat. Why? Because it was neither radical nor democratic. Its watchwords were the

hackneyed ones of "a business administration, honesty, efficiency and economy." According to these standards the Low administration was a success.

It was honest. Hardly the shadow of a scandal invaded the respectable precincts of the City Hall during the incumbency of Reform. The higher city officials were above the taint of suspicion, and there were few hints at connivance below.

The administration was efficient—in accomplishing the ends of Reform. Every department was before the end manned by enthusiastic and capable men of affairs or tried leaders in constructive reform. Major Woodbury was attacked; he has been retained by his political opponents. Police Commissioner Partridge was replaced by a man who made one of the most brilliant records of the administration in one year's time. Commissioners De Forest, Folks, Lederle and others were more than able administrators; they were innovators of the first rank. Comptroller Grout, after revolutionizing the business and financial methods of the city, ended by an achievement more imperatively demanded than all else, an increase of the borrowing capacity of the city by $100,000,000.

SETH LOW

The administration was economical. The assessments were raised, but pains were taken to show that the average citizen had not had his taxes increased. Every department cried out for money, but the Board of Estimate saw to it that that powerful ten per cent. of the people that pay taxes should in no case find grounds for complaint against "popular expenditures."

Waste having been eliminated by the installation of honest and trained men and the curtailment of expenditures, the pledges of honesty, efficiency and economy having been fulfilled, the administration passed to the fulfilment of another promise—enforcement of the law—a policy relatively inexpensive and universally popular with the taxpaying element. Prostitution was taken away from the tenements, street solicitation was curtailed, the saloons were regulated, gambling was restricted and made to go indoors. Police blackmail was decreased. Enforcible laws and ordinances were enforced.

Reform had also promised to "reach the people" by more schools, more parks, more public conveniences. The saving of public funds and the enforcement of law means little to people who do not pay taxes and who are not disturbed by the average violations of the law. The working people are interested in those municipal policies alone which have a direct influence on their daily lives.

The most advertised popular innovation of the late administration was the improvement of the tenements, the homes of the people. The new tenement house department, tho confessing itself relatively helpless with the old tenements, proceeded to enforce stringent provisions on the new. This had two results. Fewer tenements were built, and when they were finished the rents were found to have put them quite out of reach of the average workman. They are being used by the clerks and skilled artisans. The experience of Liverpool, Glasgow and London, which have been working for years on the housing problem, shows that more could hardly have been done without the adoption of an entirely new policy. The erection of tenements by the muncipality, which has provided homes for more than 100,000 people in these

British cities, requires a large expenditure of money. This municipal "Socialism" would hardly be tolerated by the wealthy taxpayers who form such a valuable element in New York Reform.

Similarly with other reforms—the money was not forthcoming. A vast amount of agitation resulted in the opening of four small parks and two small municipal baths. The need is for hundreds.

Next to nothing was done for municipal ownership. Public franchises were no longer sold privately, but there was not even an effort to give the people their money back in the form of 3 cent fares. It was only after every other resort had failed that plans were finally accepted to take over the ferries to Staten Island. After two years of Reform administration, the public service corporations of Greater New York, with a capitalization of $724,000,000, are infinitely better intrenched than before.

The schools were doubtless improved internally—in administration and quality of teaching force. But what the people saw was 87,000 children on half-time at the close of the administration against 55,000 at its beginning. This year the School Board, realizing the unwillingness of the administration materially to increase taxes for any purpose, made a modest demand for an appropriation only slightly greater than that of the year before. Even this pittance for the children was cut down until the increase failed to correspond with that of the population. Kindergartens, high schools, manual training schools, commercial schools, gymnasiums—more needed perhaps in New York than in any city in the country—were abandoned or put back, while there are still from fifty to sixty children in a class.

So it was with other departments that touch the people. Improvements were made, but in no case was the money forthcoming so that it could be said that the municipality was reaching them in their daily lives.

New York Reform has failed to "make good" its promise of reform "for the people," because it is not of the people. Undemocratic in its origin, it has been permeated with a fear of democracy and has tried every means to restrict it. District Attorney Jerome says: "Democracy is still on trial." Abraham Lincoln said: "Democracy has succeeded." In Chicago they have voted for direct election of the School Board. The New York charter puts the power of appointment and every other possible power into the hands of the Mayor out of fear of the representatives of the people. While Chicago has demanded and obtained a popular referendum on municipal ownership, New York Reform has offered the people an autocratic self-perpetuating rapid transit commission. While Chicago has been fighting for home rule, New York reformers have often stood for commissions appointed by the Governor of the State.

New York Reform has come from above. The people of the tenement houses have learned that government by the propertied classes means insufficient schools and a retardation of everything that the people demand from the city.

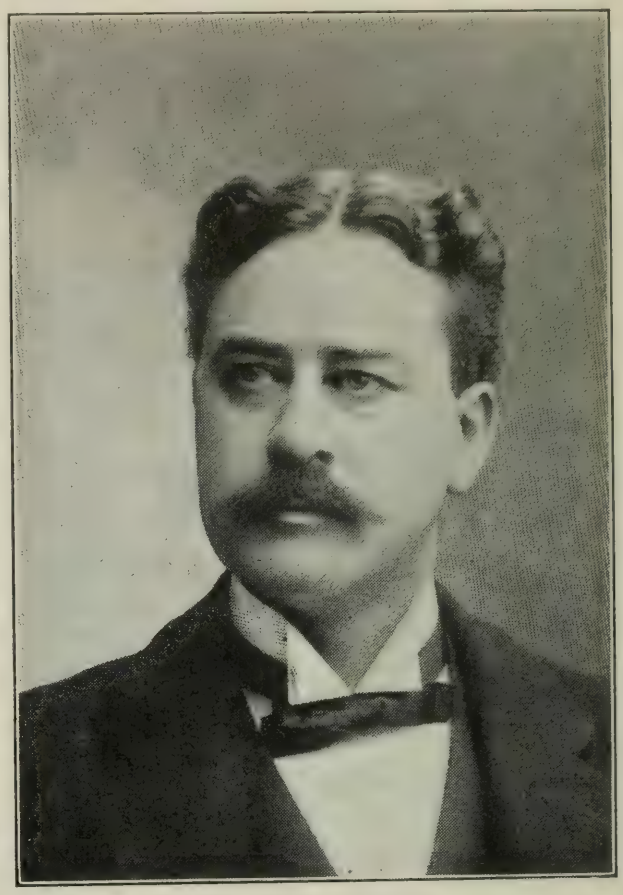
Reform in New York has been conservative and autocratic. Reform in Chicago has been radical and democratic. The working people have turned out New York Reform by overwhelming majorities. In the districts where the working class lives the vote was three and four to one against the "business" administration. By almost the same majorities the working people of Chicago have invited "municipal socialism."

There is no longer any excuse for ignorance of what the people want in municipal politics. Here is the program so clearly shown by the New York and Chicago results:

First. Democracy—the referendum on important issues. Election by the people, instead of appointment by the executive.

Second. Municipal ownership.

Third. Increased expenditures for the people.



Fourth. Increased taxation—of corporations, ground rents and the luxuries of the rich.

CHICAGO.

The Chicago situation is condensed in the personal history of Carter H. Harrison. He is the index to the whole book. He is the focus of all the rays of local politics. He proves how futile it is to study history as "the product of social forces" without at the same time study-

ing the personal characteristics of the men to whom those forces are both origins and consequences, parents and children.

Carter H. Harrison was born heir to the Democratic machine of Chicago. His father had been to his friends a demigod and to his enemies a demagog. He had held the interesting and by no means indefensible opinion that in a Democracy it was the duty of a public official to be, not the leader, but the executor of popular thought. Some of the people were good. He was their servant. More of the people were bad. He was more their servant. He did not believe that the maxim about the voice of the people being the voice of God lost its truth simply because the people had gone to the devil. He found his constituents anxious to disregard the laws which they had ordained. He did not pretend to be in advance of his generation. He did not pretend to be wiser than human nature. He was a political non-resistant. He allowed the people of his haphazard frontier town to treat the laws as they pleased. And out of this compromise with gambling, prostitution and general lawlessness he built the financial foundation of the machine which he transmitted to his own true son.

CARTER H. HARRISON

What did this son do when with the clear eyes of youth he beheld the sordid basis of his heritage? Well, he did not retire into the desert to meditate on the worldliness of the world. He went Margaret Fuller one better. She accepted the universe. He accepted the world. He became the greatest opportunist of his age.

For years he remained under tutelage. Great machinists like Burke taught him all they knew about the mechanics of politics. It did not matter to him that he seemed to the public to have a ring in his nose. Imperturbable, inscrutable, without enthusiasms, without confidants, he allowed himself to be placed on the throne and allowed the machinists who had placed him there to believe that without their services as a kitchen cabinet his fall would be a matter of about two minutes.

It began to be noticed, however, that the members of the kitchen cabinet were successively finding themselves out in the garbage box. Mr. Harrison never raised the standard of hopeless, despairing revolt. He never formed a "Young Democratic" party. He never got on the outside. He preferred to wait till he was strong enough to put the other man on the outside. Burke, the greatest of the machinists, was the last to go. But he went.

To-day Mr. Harrison is not only the head-piece, but the head of his party. As he had been elevated to power without passing through the ranks, he had never made the acquaintance of the wriggling grafters who fill those ranks. He had simply "accepted" them. They were part of the established institution which he inherited. Now, however, an awakened—or, at least, a somnambulistic—public conscience was demanding a change. Municipal government was to be a public service instead of a private scramble. The greatest opportunist of his age was not perturbed. It was necessary to retain the wriggling grafters. It

was necessary to appease the public conscience. The feat was colossal in its magnitude and colossal in its straddle, but it was accomplished.

A new kind of Chicago departmental head began to appear. The man who could qualify for a departmental headship had to be incorruptible, but unadventurous. He had to be not only himself above suspicion, but incapable of suspecting others. He had to be of an amiable, trusting, uninvestigating disposition. With the alchemy of his name he had to transmute his whole department into pure gold.

This was an improvement. But the public conscience continued to rub its eyes and to dream that it saw things. Hull House turned up a nest of wriggling grafters in the sanitary inspection bureau. The Citizens' Association turned up another equally verminous nest in the building department. A wealthy citizen began to dig a mine of investigation into the police department. This mine was just about to explode. The greatest opportunist of his age did not miss his opportunity. He anticipated the explosion. He called the reporters into his office. "Grafters? Why, of course, there are grafters. Everybody knows that there are grafters. There are grafters all around us. Let's get out and find them."

The old machinists spoke of this as "Harrison's fool graft interview." The newspapers, however, had long ago observed that when Harrison did a fool thing it was time to begin to watch for the discomfiture of his enemies. The council appointed a graft investigation committee. Some of the grafters were dug out and thrown away. Many of the city officials who had been in the habit of shaking down were given the sensation of being shaken up. The civil service commission, which had been devoting most of its energy to illustrating Whitman's line:

"Me imperturbe, standing alone in Nature,"

was galvanized out of its imperturbability. An investigation of the whole city government had been accomplished under the auspices of Carter H. Harrison.

But it is not only in this flirtation with the public conscience of Chicago that Mr. Harrison has succeeded in illustrating his coquettish opportunism. One flirtation is not enough for him. There is in Chicago not only a public conscience, but a social conscience. This social conscience is stronger against stock manipulations than against stud poker. It abhors street railway corporations more than it abhors houses of prostitution. It is more intent on regulating boards of directors than on regulating the city hall. It has amassed large majorities on election days when municipal ownership and the referendum have been put to an academic vote. It is a Jonah's gourd of popular enthusiasm.

Mr. Harrison's political opponents, calling for a business administration, have found—or, rather, they have had it thrust almost within the range of their vision—that the word "business" did not appeal to the mass of employees. Mr. Harrison did not use the word "business." Instead he persuaded the people that he was their protector against the kind of "business" that they saw in the public franchise corporations. He gave it out that municipal ownership was a beautiful thing. This divided the reformers. All of them were in favor of clean government. Not all of them were in favor of a "business" administration. They feared magnates more than they feared grafters.

In the last mayoralty election Mr. Harrison had behind him at least four elements; the regular Democratic machine; the more or less independent Democrats, whose public consciences had been soothed by gradual improvements in the city hall; the regular radicals, whose social consciences had been soothed by insinuations about municipal ownership, and the reformers, who, possessing consciences of both the public and the social kind, halted between two opinions, but finally inclined to the latter.

"Let us appeal to Springfield for a municipal ownership enabling act," said Mr. Harrison. "Let us," said the Republicans. "What a fool move on Harrison's part," said the machinists. "The traction question was the only one on which he had the Republicans beaten. Now he has put himself on exactly the same platform with them." But the Republican legislature showed few vestiges of

a social conscience. It seemed to regard municipal ownership as too beautiful a thing. It was not till after the election that it passed the enabling act. Meanwhile, Mr. Harrison, having by his fool move placed the Republican party in a position of antagonism to the social conscience, was for the fourth time elected Mayor of Chicago.

All this is very perplexing to the "business reformer." He notices that the city departments are complaisant and even venal in their enforcement of the law. He notices that from September 27th to October 27th, last year, there were 394 burglaries and holdups and only 87 arrests. He notices that gambling "clubs" grow wealthy. He notices that the most ancient profession in the world still continues to divide its filthy earnings with the police force. He notices that throughout the city administration there is a general belowparness. Yet when he puts up Gabriel on a "business" ticket he falls before a municipal ownership Lucifer. Truly an occasion for more banquets and more speeches! As one "business" reformer put it, "The last election was a sad commentary on the willingness of the people to accept a financial consideration in place of personal integrity, a street car system in place of an incorruptible executive."

Meanwhile opportunism does not make sad commentaries on the people. It simply obeys them. They want the public franchise corporations bearded and perhaps shorn. Let the public franchise corporations be bearded and perhaps shorn. "Business" reform may dine itself into dyspepsia and talk itself into aphasia, but if it cannot deliver the people at the polls, why should opportunism waste time with it?

Besides, if "business" reform should ever condescend to humor the delusions of the people and to array itself against the public franchise corporations, even then opportunism would be found in the middle of the carpet. Carter H. Harrison cannot be lost. When he accepted the world he accepted the good in it as well as the bad. If the people want to be good his principles as a Democrat make it necessary for him to put their goodness in force through the municipal machinery under his control. If he had to choose between the votes of 50,000 Christian Endeavorers and 40,000 gamblers he would probably choose the Christian Endeavorers after having had an indemnity company give bond for them to the effect that they would come out to vote even if it rained.

And this is where one of the two tines of the fork of opportunism will begin to enter into the soul of the unbending, undeviating moralist. The moralist will look on furiously, but impotently, while the opportunist shows how with the "good," instead of with the "bad," tine of his fork, he has improved the town as fast as the general indifference and the general lawlessness of the public would permit. He will show how in 1897 Chicago could not tell what its financial condition was, and how in 1904 Comptroller McGann had introduced such reforms that at a general meeting of the comptrollers of the country at Washington the Chicago system of accounting was acknowledged to be the best in existence. He will show how the most ancient profession in the world has been driven off the streets and out of the basements of the down town district into districts of its own. He will show how gambling has ceased to stalk and has begun to skulk. He will show how all the city departments have at his suggestion been swept out and tidied up by investigating committees. He will show how the gray wolves have been exorcised from the city council and how the Municipal Voters' League was allowed to do the exorcising without any public opposition from him even on behalf of his friends. He will show how the civil service law has been strengthened and extended. He will show how in almost every respect the city government is better to-day than it was when he became Mayor. And he will maintain that gradual irreversible improvements effected by straight politicians are more advantageous to the city than violent alternations between amateur municipal experts and professional reactionary corruptionists.

Control of the organization, concessions to the innovators—these are the two firm legs on which opportunism stands. Those of the innovators who are not radicals may be alienated, but the number of innovators who are radi-

cals is so large that the absence of the others will not be noticed. Reform without radicalism in a mayoralty election in Chicago is an impossibility as long as the Democratic machine candidate is willing to outbid his Republican rival for the radical vote.

This means two things. It means that reform in Chicago will be gradual rather than spasmodic. It will keep pace with the center of gravity rather than with the nebulous swirl of advance thought. It will carry the body of the people with it. It will represent "average opinion" rather than "the better element."

The second thing that the present situation means is that reform in Chicago will be tinctured with social democratic sentiment. It will coalesce with the diffusion of power among the people. It will fall in with the drift toward municipal ownership and the referendum. If we recoil from the dangers of such a course and rally around a purely "business" candidate, we shall have merely the satisfaction of registering our convictions. The machine and the radicals together are the voice of God, a special revelation, a majority.

With Marjorie in April

BY LEWIS WORTHINGTON SMITH

Sweetheart here on my shoulder,
Three years old next June,
Do you know that the grass is springing,
That April is coming soon?
I shall take you by lanes and by-ways,
Far off from the pavement noise
To a strange new land of wonder,
And a world of strange new joys.

Sweetheart here on my shoulder,
I shall find things for your eyes
To see with a sweet new rapture
And a rush of glad surprise.
I shall feel your soft hand tremble,
I shall hear your baby-cry
Of delight in each new-found treasure
And the blue of the April sky.

Sweetheart here on my shoulder,
We shall sing on, hand in hand,
With never a care or question
Or a wish to understand.
We shall both be happy, happy,
The long, long daytime through;
We shall both be happy, happy,
With the twilight stars and dew.

Drake University, Des Moines, Ia.

Has the Small Family Become an American Ideal?

BY LYDIA KINGSMILL COMMANDER

[Mrs. Commander attempts to give facts as she has found them to exist in the large city of New York. She does not give her own opinion on the subject opened by President Roosevelt. We are free to give ours, that a large family in any but the lowest strata of society is a beautiful institution, conducive to the noblest and most unselfish character and crowned with blessings to the parents in their old age.—EDITOR.]

THE decline in the American birth-rate has for some years been of considerable interest to those who are quick to discern national tendencies. Conventions of ministers of different denominations have repeatedly discussed the subject, and physicians have called it to the attention of the public.

But it was only when President Roosevelt sent out his trumpet-blast protest against what he termed "race suicide" that the nation, as a whole, became aware of the importance of the population question.

That the large family of the early days of this country has disappeared every one is aware. Benjamin Franklin was one of fourteen children, a number far from uncommon at that time, but scarcely to be met twice in a lifetime now. Franklin stated that eight was the American average family two centuries ago and, figuring on that basis, foresaw for this country a population of 100,000,000 by 1900.

Instead we have 76,000,000, of whom 11,000,000 are foreign-born and 13,000,000 the children of foreign-born parents. Only 52,000,000, a trifle over half the number Franklin predicted, have therefore descended from the early American stock. So far from eight being now the average family, that number is considered astonishingly large.

In fact, about the time of the President's famous utterance my attention was especially called to this question by the exclusion from a number of New York flat houses of two families, the one containing seven and the other five children, on no other charge than that the families were too numerous to be desirable as tenants.

Apropos of these incidents, I made some investigations and found that New York landlords had decided prejudices against children and that there was a striking absence of them in the better neighborhoods of the city. Six real estate agents, controlling flats renting at from $50 to $100 a month, in locations from about 80th Street to 140th Street, on the West Side of the city, practically refused to take more than two children, and plainly indicated that even they were not desired.

In visiting buildings it became evident that either the landlords will not take children or there are few to take in the well-to-do sections of the city. In a house on the Boulevard containing suites renting from $400 to $800, there were sixty families and only five children. Another, with rents from $700 to $900, had forty families and six children. In another, among thirty-five families there was only one child, a month old baby. In sixteen eleven-room suites in the next block only four children were found.

Two houses, side by side, each contained twelve eight-room flats. These were especially large apartments, there being one hundred feet of private hall running from the rear of the drawing room to the front of the dining room. The former room was 23 x 21 and the latter almost as large. The rents ranged from $800 to $1,200, indicative of incomes from $4,000 to $6,000; yet in one house there were three children, in the other none.

Altogether I visited twenty-two apartment houses, containing 485 families, in which were just 54 children, or about one child to every nine families. In downtown apartment houses, between 40th and 10th streets, I was repeatedly asked,

"Have you any children or dogs?" and informed, "We never take either." Four landlords said: "The only tenants I will accept are married couples without children." It indicates the existence of a numerous class of childless couples when large apartment houses are built and equipped for the express purpose of catering to them and to no one else. But even in the less expensive part of the city the family without children is preferred. In a house with fifteen flats renting from $16 to $18 a month the janitor proudly assured me there was not a child in the house.

To discover the causes lying at the basis of these conditions I visited forty-six New York physicians, men and women, practicing in different parts of the city, and gathered their opinions upon the question. Physicians are in a position to understand this matter because they get the confidence of their patients as no other class can. These doctors based their opinions on experience covering, in many instances, thousands of cases. Of the forty-six whom I visited several declined to discuss the question at all, and others were extremely guarded in their remarks. But thirty-eight had facts and opinions which they gave me frankly, with the understanding that their names were not to be quoted.

Of the thirty-eight physicians who were willing to discuss the matter, I asked: "What do you consider the ideal American family?" Thirty said, "Two children, a boy and a girl." Six said, "One child." One said, "Having a family is not an American ideal," and one said "Five or six." The last, whose report varied so entirely from every other, said she had not discovered any objection to family on the part of Americans. But she qualified her statement by the explanation that her position was possibly exceptional, her practice being in the upper part of the Bronx among people who have moved to that locality because their families are too large to live comfortably in the more crowded parts of the city. She said, too: "Probably my desires color the expression of the wishes of my patients. As I always strongly advocate five or six children, it may lead women to agree with me, at least during conversation. Besides, my views being well known, I probably attract women of similar opinions. I am inclined to think this is true because when I commenced to practice I was frequently consulted in regard to the size of the family, whereas now I seldom am."

The physician who claimed that having a family was not an American ideal (Dr. A. W.) has been practicing for fourteen years on the West Side in the upper Sixties. Her patients are women living in apartments on incomes ranging from $3,000 to $5,000. She said: "Among my patients I find that the majority do not want any children; certainly not more than one. I should say that as a rule the second is an accident, the third is a misfortune, and the fourth a tragedy. In all my practice, and it is a large one, this," taking from her desk a photograph of three children, "is my largest family, and the only one of the size. I once had a patient who had three children and adopted three of her brother's, left orphaned; but she was not a New Yorker, and she is the only one like that of whom I have ever even heard."

A few blocks distant is Dr. D., a physician of twenty years' experience and a specialist in gynecology. Her patients are similar in financial position to those of Dr. W., but the women are rather more domestic and less fond of society. She said: "Most Americans want one child or two; two, if a boy and a girl, are probably preferred. No one criticises that number or considers it too small. There is no doubt the large family has disappeared, never to return."

Altogether twelve physicians, practicing among people in comfortable circumstances, and generalizing in all from many thousands of cases, expressed practically these opinions—viz., that the large family does not exist and is not desired.

Nor do those doctors whose patients are less fortunately situated, financially, give a different report. Of nineteen physicians, the majority of whose patients follow the better paid trades and clerical work, such as bookeeping, etc., with from $20 to $35 a week, all agreed that no desire for large families is to be found.

Dr. J. has practiced for eight years mainly among women. He said: "Most of my patients are people in the middle

class financially. They have $1,000 to $1,800 a year. They are just the class always declared to be the bulwark of a nation. They have the vices of neither the rich nor the poor. They are steady, industrious, respectable and live comfortably. They do not want big families, tho, and they will not have them. They generally want one or two, but never more." Dr. R., who has been practicing for eighteen years among all classes, said: "I think most of my patients want children. I am often consulted by childless women who wish for family. But they never want more than one or two. I cannot recall in all my experience a woman who wished for and sought to have a family of five or six."

Dr. I., practicing twelve years among intelligent but not very prosperous people on the upper East Side, said: "I find few who wish to be childless. Most people want one or two children. A very few are willing to have three, and fewer still, four. More than that is considered too many. During my entire experience I have been looking for women willing to have all the children nature would send and have, in twelve years, found *only one woman.*"

The reports were all practically repetitions of this, variously worded. Nor was I able to discover that the poor were more eager to add to the population. It appears that they do so more inadvertently than through intention.

Nearly all the doctors I consulted either are now attending free clinics or have done so at some time in the past and are, therefore, familiar with the attitude of mind of the women forced through poverty to seek free medical attention. Dr. G. M. has been practicing for six years and has a free clinic for women every afternoon. She has been especially interested in this qeustion and has kept exact records of cases. She said: "The desire to limit or eliminate family is universal. Children are no more, or scarcely more, desired among the poor than among the rich, tho the poor are often less successful in avoiding them. I am consulted professionally in regard to this every day." Dr. A. L., who has done free clinic work for ten years, seeing an average of eighteen patients daily, said: "Whenever the woman of the poorer classes is the least bit above the lowest level, she desires to cease having children. No request is made of me oftener in the clinic than for advice along these lines." Fourteen other physicians having clinic experience confirmed these opinions.

There seems to be a general impression that our foreign population is entirely free from this tendency to restrict family; that they accept all that come without question.

Dr. Shrady, while he deplores the falling birth-rate among native Americans, says: "The Irish, the Germans and the Italians go ahead and have children." I therefore included among the physicians visited six practicing almost entirely among foreigners, and of the others six had a considerable number of foreigners among their patients. Dr. A. I. was educated in Europe and practiced there two years, and has practiced in New York for eleven years. Her patients are very intelligent but not especially well-to-do foreigners, Germans and Russian Jews. She said: "It is thoroughly American to restrict the population. It is a mistake to suppose that the foreign people keep up the population rate after they come here. Not to do so is one of the first things they learn. As soon as men and women have become thoroughly imbued with the American spirit they will not have a large family. I believe fewer foreigners than Americans are content to be childless, but they quickly accept the American idea of one or two, and think three or four a great plenty. Even the woman who was in the midst of contentedly having a large family in Europe will stop short once she gets to this country. She will, perhaps, have one or two after she lands, but by that time she will have learned the American lesson and there will be no more."

Dr. P. has practiced six years in Russia, two years in a dispensary in New York, and several years in private practice. Her patients in Russia were Jews in moderate circumstances, with a few rich. Her New York dispensary work was among the very poor of all nationalities. At present her patients are Russian Jews, with incomes from $10 to $30 a week. She said: "Jewish men still desire children, but some Jewish women

are as anxious to avoid them as Gentiles. They are, I believe, not quite so much opposed to children. Very few, tho some, want none. Many want only one, do not mind two, but object to more than three. Among the poorer I often find five or six and the mothers of such families seem satisfied."

"Did you find this tendency among your patients in Russia?" I asked.

"Scarcely at all," she replied. "A very few, among the wealthy, who had been to Paris, caught the idea. The rest never heard of such a thing. Yet women in the same class of life here restrict their family as a matter of course. Some of the same women who were having large families in Russia have come out here and quit at once. The mother of six said to me: 'I wish I had come to America sooner; I shouldn't have had so many children.'"

Dr. R. E., who has a mixed practice, partly American, partly foreign, intelligent people in moderate circumstances, said: "As far as I can see the difference between foreign and native-born is that the Americans grow up to the idea and foreigners have to learn it. In the interval between landing and getting the notion they naturally are adding to the population. But once they become Americanized, they are as opposed to indiscriminate reproduction as Americans. Intelligent foreigners adopt that idea sooner than ignorant ones."

The only physicians who gave me reports of unrestricted reproduction had patients among the unintelligent poor, or the really pauper class. A physician with a large practice among the very poor said: "Only the tenement woman, who has no sense of responsibility, and no care for her children after they are here, has children without regard to numbers."

Dr. H. M. has been practicing for six years as a charity physician for a mission church on the East Side. She has under her care about two hundred families, the majority Germans, with a few Irish and English. All the families get occasional help; some almost live on charity. Dr. M. said: "There is no 'race suicide,' numerically speaking, among these people. They are indifferent how many children they have. The most prolific couples on my list are a few Irish and low English, who are almost entirely maintained by charity, yet continue to produce. *I find that as the sense of responsibility lessens, the family increases.*"

Three other physicians doing charity work gave similar experience. A doctor practicing for seven years in the Italian quarter said: "The Italians have not adopted American ideas to any extent. They herd in their tenements regardless of comfort, and seem content to live in a garret or cellar. I never knew one to ask for no family or fewer children. They have from twelve to sixteen children and some as many as twenty-two."

Another doctor with experience among the very poor said: "My patients are largely foreign born and are distressingly prolific. Still those who begin to learn self respect and American ideas invariably wish to restrict their families. Those who produce incessantly and without attempt at check are always a class that we would better have excluded from the country. They are the poorest possible material for making Americans."

So far I have spoken exclusively of women in relation to the checking of population, as they are the ones most intimately and immediately concerned. But it does not appear that American men are more desirous than women of large families or to any considerable extent oppose the present tendency.

Fewer men than women seem to be satisfied with no children, but few, if any, have any desire for a large family.

Dr. D. S., who has been practicing for twenty years among a well-to-do class of people, said: "I believe the majority of men are pleased to have one child or two, providing their wives are willing, but they do not want many children any more than the wives. I never knew a man who would wish to have six or eight children to support. Some might take them without complaint if they came, but more would be very much disconcerted by every arrival over three or four. A great many men who would otherwise like to have children are willing to go without to please their wives."

Dr. P., quoted before, said: "Among Jewish men the desire for children is still very strong, but I cannot say that I think it any indication of stronger natural instincts or real affection in men than

women. It is simply the result of a desire to have what other men have."

Dr. A., practicing among a class of rich women, living easy, luxurious lives and not wishing family, said: "I find that most men like a child or two but not more. Yet the American man of today has no horror of a childless life. He is not domestic and patriarchal like European men. Of course, the very rich want heirs, but the average man is satisfied with or without and would much prefer none at all to an old-fashioned eight or ten."

Dr. J. S., practicing eight years among people in comfortable circumstances, incomes ranging from $1,500 to $4,000, said: "Men, probably, on the whole, desire children more than women. Naturally, they would; they get all the pride and miss the pain. But in my experience they are usually satisfied with two or three—often with one. Sometimes men welcome a large family and will seem pleased over every additional arrival, but they are the exceptions."

Dr. J., a specialist in gynecology, said: "I don't think men are as much interested in the question as women,—as, indeed, they naturally could not be. I have to get my opinions of them through their wives, and the reports vary. Some men are eager for family, some indifferent and some utterly opposed. I have even had several cases of women who desired children, but whose husbands would not consent. I do not think there is any considerable sentiment in favor of large families among men. President Roosevelt would find himself in a minority even among his own sex."

The opposition to large families is not only individual but social. Not only do people object to large families for themselves, they do not want others to have them. Americans disapprove of the large family as a social institution. They dislike to see it and condemn its existence. The producers of large families are considered rather in the light of social enemies than social benefactors.

A physician who has practiced in New York for over twenty years among well-off Americans, as well as having done a great deal of clinic work, said: "The large family is never anything but an unintentional misfortune at the present. Nowadays the mother of a large family feels humiliated. She is really an object of ridicule. People laugh at her at best, and blame her if she is poor. Society does not approve of many children. Unless people have plenty of money we do not excuse them for having a large family. We know that only ample means will enable parents to do justice to many children." Another doctor, who has practiced for six years among different classes of people, said: "I often have women say, 'Doctor, I can't have another. I'm getting such a family I'm ashamed. I don't like to be laughed at.'"

In a woman's club in New York, President Roosevelt's opinions on "race suicide" were discussed and his attitude generally condemned. Of thirty-four present only two agreed with Mr. Roosevelt. The remaining thirty-two indorsed the statement of one of the members: "There are thousands born that have no business to be born."

A review of the evidence gathered points to these conclusions:

1. That the size of the American family has diminished.

2. That the decline is greatest among the rich and educated, but also exists, to a marked extent, among the middle class and the intelligent poor.

3. That only the most ignorant and irresponsible make no effort to limit the number of their children.

4. That not only has the large family disappeared, but it is no longer desired.

5. That the prevailing American ideal, among rich and poor, educated and uneducated, women and men, is two children.

6. That childlessness is no longer considered a disgrace or even a misfortune; but is frequently desired and voluntarily sought.

7. That opposition to large families is so strong an American tendency that our immigrants are speedily influenced by it; even Jews, famous for ages for their love of family, exhibiting its effects.

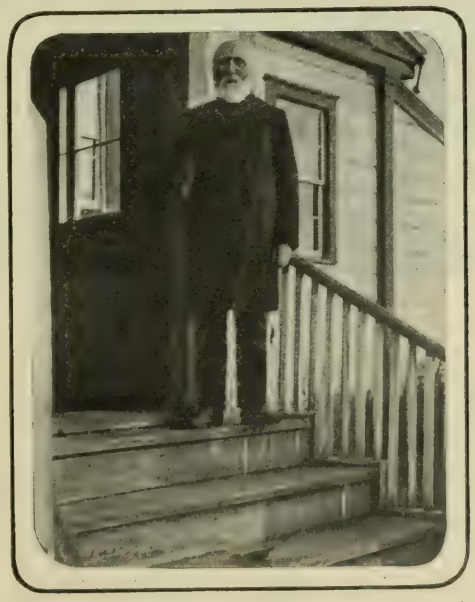
8. That the large family is not only individually, but socially, disapproved; the parents of numerous children meeting public censure.

New York City.

An Indian Arcadia in Alaska

BY GEORGE T. B. DAVIS

[The following article is the result of a trip made specially for the purpose of seeing at first hand the great work Mr. Duncan has done among the Alaskan Indians. —EDITOR.]



ON the point of an island facing a beautiful bay in the southern part of Alaska lies an Indian village which has a history stranger than an Arabian Night's tale. The town is called Metlakahtla and is to-day a thriving red man's city of 800 inhabitants, with handsome houses, wide sidewalks, numerous stores, a salmon factory and the largest church in Alaska. It is the most beautiful city of its size in Alaska, and has recently been called "the most peaceful, moral and industrious community in the entire United States." Yet—it seems incredible, but is a fact—less than fifty years ago these same Indians were fierce and cruel savages, famed as the most bloodthirsty tribes on the north Pacific coast.

A Typical Seven-year-old Indian Boy of To-day

Chiefly through the agency of a single man, who, at the peril of his life, went among them forty-six years ago, have these tribes been transformed from heathenism to Christianity and from savagery to civilization. The story of the difficulties and dangers that beset this man's pathway and of the gradual steps in the regeneration of the red men is far stranger than fiction, and it was to obtain it at first hand that I made a special journey of 3,000 miles solely to see and study this unprecedented achievement of an Indian community.

Eleven days full of fascinating interest were spent on the island as the guest of Mr. Duncan, the founder of the work, who is still hale and hearty at seventy-two years of age. I found a veritable island paradise, where the world with its mad rush is forgotten, and one lives as in a dream, seemingly transported back nineteen hundred years into a Christian community of the first century. The view of the broad bay and of the semicircular snow-capped mountains in the distance as seen from the village beach is probably unsurpassed by any scenery in Alaska, and it is amid this natural grandeur that the people live and thrive in peaceful, industrious contentment.

Mr. William Duncan, Standing at the Door of His Office

It was in 1853 that the idea of converting and civilizing these red men originated. At this time Captain Prevost, of the British Navy, was commander of the warship "Virago," which was one of a North Pacific fleet having its headquarters at Victoria, on Vancouver Island. One of the chief duties of the fleet was the policing of the Indian tribes scattered up and down the coast. On one occasion, while cruising in northern waters, the "Virago" was beached at Fort Simpson (the Port Simpson which figured prominently in the Alaska decision) in order that some repairs might be made to the ship. In the near vicinity of Fort Simpson—which was a heavily barricaded trading post—there resided nearly a dozen tribes of Tsimshean Indians, who kept the inhabitants of the Fort in constant fear of wholesale massacre. During the days spent among them Captain Prevost admired the fine physique of many of the warriors, but

was deeply stirred by their savage, heathen condition. The vices of the white men, added to the intertribal wars among themselves, were fast thinning their ranks.

On his return to England a few years later Captain Prevost wrote an earnest appeal for the *Church Missionary Intelligencer,* urging that a teacher be sent at once among these Tsimshean tribes. In response $2,500 was given to the Church Missionary Society, and a young man named William Duncan, was chosen for the perilous misison. Captain Prevost was just then returning to the North Pacific Coast of America in command of the warship "Satellite," and had offered the new missionary a free passage in his ship. On a seven days' notice the young man prepared his outfit, bade farewell to his friends, and set out to risk his life among savage Indians on the other side of the globe. After a voyage lasting six months Victoria was reached. Here Sir James Douglas, the Governor of the Hudson Bay Company in this region, endeavored to dissuade the young man from going farther north, declaring he would surely be killed by the fierce Indians about Fort Simpson, and urged him to work among the tribes around Victoria, where he would have ample protection. Mr. Duncan, however, declared he had been sent to Fort Simpson and there he would go, whether he lived or died after he arrived, while Captain Prevost said that if he was not allowed to go farther north he would carry him back to England when his ship returned. Their counsel finally prevailed over that of the famous Governor, and after waiting three months for a boat, Mr. Duncan reached Fort Simpson in October, 1857.

His first glimpses of Indian nature were enough to dampen the ardor of any save the most heroic. On the second day after his arrival, as he was walking on the gallery of Fort Simpson, he saw a slave woman ordered down to the beach by a chief and there slain in cold blood. A few minutes later two bands of savages, each headed by a half-naked medicine man, approached the body from different directions and tore it in pieces

A Bird's-eye View of Metlakahtla, Showing the Bay and the Mountains on Prince of Wales Island

with their teeth, the whole being a part of the religious ceremonies of the tribes. Again, within a week after his arrival at the Fort, Mr. Duncan saw another typical example of Indian character. Several chiefs had been warmly discussing some subject, and Legiac, the head chief of the Tsimshean nation, had left the conference in a bad temper. Wishing to give vent to his feelings, he presently saw a man from a distant tribe walking near the Fort, and raising his gun, shot him down. As the man did not expire at once, Legiac ordered two of his men to come up and fire twice into the body of the mortally wounded stranger. All this was witnessed from the Fort gallery, but the inmates dared not interfere.

A Partial View of the Town, Looking from the Church Tower

These instances give one a faint glimpse of the condition of things at Fort Simpson when Mr. Duncan first went among the Indians, but he was undaunted by such terrible sights. Of Legiac we will hear more as the story unfolds.

For eight months Mr. Duncan toiled day and night learning the Tsimshean language, with the assistance of Clah, a native who had free access to the Fort. Much curiosity was aroused among the Indians concerning the mission of Mr. Duncan, and ere long the rumor spread that he had come from afar off to bring them a message from God. One day an Indian came into the Fort to verify the rumor, and Mr. Duncan reports their conversation as follows:

"The Indian first asked: 'What do you mean by 1858?'

"I had to tell him that 1858 represented the number of years that we had had the Gospel of God in the world.

"He said: 'Why didn't you tell us of this before? Why were not our forefathers told this?'

"I looked upon that as a poser. He said to me: 'Have you got the Word of God?'

"That in the English language would be equivalent to saying: 'Have you got a letter from God?'

"I said: 'Yes, I have God's letter.' That would really be the idea that would reach the Indian.

"He said: 'I want to see it.' I then got my Bible. Remember, this was my first introduction. I wanted them to un-

The Metlakahtla Village Band and the Girls' Zobo Band

derstand that I had not brought a message from the white man in England, or anywhere else, but a message from the King of Kings, the God of Heaven. They wanted to see that. The man came into the house and I showed him the Bible. He put his finger very cautiously upon it and said: 'Is that the Word?'

"'Yes,' I said, 'it is.'

"He said: 'Has He sent it to us?'

"I said: 'He has, just as much as He has to me.'

"'Are you going to tell the Indians that?'

"I said: 'I am.'

"He said: 'Good, very good.'"

Having mastered the language, Mr. Duncan prepared a formal address in Tsimshean, stating the object of his mission to the Indians. He then gave notice to the people to gather at the houses of their chiefs, and on the same day the address was delivered in nine different places to over 1,000 persons. Legiac, the head chief, was so impressed by what he heard that he at once offered Mr. Duncan the use of his large house as a school room. His offer was gladly accepted, and a school numbering about 40 children and adults was carried on until Legiac went off on a hunting expedition. By that time the school had proved such a success that a special building was erected with the willing assistance of the natives.

When, however, the season for the ceremonies of the medicine men came around, Legiac—himself a leader in the performances—conferred with the other participants and sent word to Mr. Duncan that his school must close for the thirty days during which the ceremonies would continue. Mr. Duncan considered the matter and returned answer that he could not accede to the request. The leaders again held a conference and finally sent a message saying they would be satisfied if the school was closed two weeks; if, however, this was not done, serious consequences would follow. Mr. Duncan knew full well that it might mean death for him to refuse, but he returned answer that the school would not close a single hour.

A few days later, as he was about to open the afternoon session, a series of savage whoops were heard, and a number of hideously-painted medicine men sprang into the building, yelling and brandishing their weapons. The children

fled precipitately, leaving Mr. Duncan to face the intruders. At first they endeavored to frighten him with threatening words and wild gesticulations, but Mr. Duncan stood calmly and replied to them without yielding an inch. Seeing this, one of the Indians whispered into Legiac's ear that he was afraid to kill the missionary. Legiac was partly intoxicated and thereupon he grew more violent and drew nearer to Mr. Duncan with a knife concealed in his hand. As he stepped forward and raised his arm to strike he suddenly paused and let it fall to his side, while he drew backward and became less violent. What had caused the change? As Legiac had moved toward Mr. Duncan he had caught sight of some one standing on guard directly behind him with a revolver beneath his blanket. It was Clah, the Indian interpreter, who had entered the building unnoticed during the long harangue, and had taken his position behind the missionary, ready to shoot the person, be he brave or chief, that attempted the life of his pale-faced friend. After a little more talk the medicine men withdrew, leaving Mr. Duncan master of the situation, and thankful to his Creator for a truly miraculous escape.

After five years of unremitting toil Mr. Duncan succeeded in winning a considerable number of converts, but was constantly hampered in his work by the evil influences of the neighborhood. The vices of the white men and the deviltry of the red men faced the converts wherever they went and kept them from making rapid progress. In view of these conditions there grew in Mr. Duncan's mind the plan of establishing a model Christian city, where the influences would be good instead of evil. Seventeen miles from the Fort was the island of Metlakahtla, the site of an old Indian village, which offered an ideal location for such a city. The converts entered enthusiastically into the plan, and Mr. Duncan decided to execute it as soon as possible. He drew up and circulated among the Indians fifteen rules which every one who wished to live in the Christian city was compelled to sign. They were as follows:

1, To give up their "Ahlied" of Indian deviltry; 2, to cease calling in "Shamans," or medicine men, when sick; 3, to cease

Kitlan Tribe: A Group Showing Some of Mr. Duncan's Early Converts

gambling; 4, to cease giving away their property for display; 5, to cease painting their faces; 6, to cease indulging in intoxicating drinks; 7, to rest on the Sabbath; 8, to attend religious instruction; 9, to send their children to school; 10, to be cleanly; 11, to be industrious; 12, to be peaceful; 13, to be liberal and honest in trade; 14, to build neat houses; 15, to pay the village tax.

One afternoon several months later six canoes, containing forty Indian pilgrims, set forth from Fort Simpson for their new island home. It was a picturesque scene worthy the brush of a painter to behold these Indians, who had for centuries led wild, savage lives, now giving up home and friends for the sake of a quiet, civilized condition of existence. It had been raining during the day, but as the canoes left the shore a rainbow shone forth, giving fresh hope and encouragement to the missionary and his band of pilgrims. Going a few miles down the coast they drew up on the shore and held an evening service of prayer and praise, after which they encamped for the night. The next day the island of Metlakahtla was reached, and they entered heartily into the task of building their homes and setting up a temporary school and church building. Within three weeks they were joined by nearly 300 other Tsimsheans, including two chiefs, making a strong colony, which soon increased to above 500 members.

The village prospered beyond Mr. Duncan's fondest dreams. A salmon cannery was erected, where he taught the people the art of canning fish in white man's fashion; a water-power sawmill was built, altho one incredulous Indian declared that when he beheld water saw wood he would be ready to die; a co-operative steamer was purchased, and a co-operative store opened. Still in search of new industries for the Indians, Mr. Duncan visited England and learned spinning, weaving and rope-making, which were taught the natives on his return. As the years passed commodious mission buildings were erected, as well as a large church costing $12,000. The village became the wonder of all Alaska, and Indians came hundreds of miles to see the red men who lived like pale faces.

Group of Indian Girls in the Boarding School at Metlakahtla, with Their Teachers

Nor was the spiritual development of the community less remarkable than the material. During the year following the removal to Metlakahtla a Bishop of the Church of England visited the island and baptized nearly three-score adults, in addition to a number of children. Legiac

himself, head chief, multi-murderer, and attempted assassin of Mr. Duncan, had joined the colony and was among the number who came forward for baptism. When asked for his religious experience, he said:

"We must put away all our evil ways. I want to take hold of God. I believe in God, the Father, who made all things, and in Jesus Christ. I constantly cry for my sins when I remember them. I believe the good will sit near to God after death. I am anxious to walk in God's ways all my life. If I turn back it will be more bitter for me than before. I pray God to wipe out my sins; strengthen me to do right; pity me. My prayers are from my heart. I think sometimes God does not hear me, because I do not give up all my sins. My sins are too heavy. I think we have not strength of ourselves."

Thrak-sha-kawn, formerly a sorcerer and medicine man, gave the following testimony:

"I wish to give up all my wicked ways. Have been a medicine man and know the lies of heathenism. I believe in the Great Farther, who made us; in Jesus, who died on the cross that God would pity us. I want the spirit of God to touch my heart. We must all stand before God. God will measure our ways. No one to be his master but God. I will not keep my eyes on the ground any more, but will look up to God all my life."

For years Legiac stood fast in the faith at heroic sacrifice of power and possessions, altho great inducements were held out to him to return to the chieftainship of the tribes remaining at Fort Simpson. On one occasion the inducements offered him to return to the old life became so strong that Legiac declared he could resist no longer. Gathering his friends about him on the beach, he bade them a tearful and most dramatic farewell, saying that notwithstanding he knew he was doing wrong, he was entirely unable to help it, as forces stronger than his own will were pulling him away. His words were full of simple eloquence and his friends wept at his decision. As he silently entered his canoe and departed, they knelt on the beach and prayed that he might return. The whole scene was most impressive and one that it is impossible to imagine under any other circumstances. After paddling a few miles down the coast Legiac went ashore for the night. Wrapping himself in his blanket, he lay down and thought to fall asleep. But no sleep came to the chieftain that night. Like Jacob of old he wrestled all night long with unseen powers, and afterward declared he would rather suffer many deaths than pass through another such night. With the dawn came victory. He silently rolled up his blankets, turned his canoe about, and went back to Metlakahtla. He was welcomed with tears of joy, and throughout the rest of his life remained an earnest and loyal Christian. He was especially devoted to Mr. Duncan and delighted to assist him in his evangelistic work. Up and down the coast he was known as "Mr. Duncan's Grand Vizier." His death in 1869 was pathetic yet beautiful.

A Typical Indian School-girl

He had been on a fishing expedition up the Noss River, and, returning, had reached Fort Simpson, when he was stricken with a deadly form of the grippe, which was then raging among the Indians. From his sick bed he dispatched a messenger to Mr. Duncan bearing the following letter:

"DEAR SIR.—I want to see you. I always remember you in my mind. I shall be very sorry if I shall not see you before I go away, because you showed me the ladder that reaches to Heaven, and I am on that ladder now. I have nothing to trouble me. I only want to see you."

In rapid succession second and third messages followed, but the grippe was also raging at Metlakahtla, and it was im-

possible for Mr. Duncan to leave his score of patients. A few days later a fourth messenger arrived bearing the news of Legaic's death and the following letter, which was unfinished:

"My Dear Sir.—This is my last letter, to say I am very happy. I am going to rest from trouble, trial and temptation. I do not feel afraid to meet my God. In my painful body I always remember the word of the Lord Jesus——"

Here the letter ended abruptly, and there was also finished the life of a modern Saul, who became the apostle Paul of the Tsimshean nation.

After twenty-five years of successful work at Metlakahtla, during which the island had become famous in both the New World and the Old, and Mr. Duncan had become almost idolized by the settlement of nearly 1,000 people, a disagreement arose concerning the methods of conducting the mission. The Church of England Missionary Society insisted upon its elaborate ritual being introduced into the Indian services, and upon the use of fermented, instead of unfermented, wine at the communion table. Mr. Duncan believed the ceremonies would work havoc with the simple faith of the Indians, reminding them too strongly of their cast-off heathen rites; hence he refused to sanction the proposed changes. He also declined to break the laws of Canada, which made it a crime punishable by imprisonment for an Indian to touch wine or liquor.

The Church Building at New Metlakahtla, Erected Entirely by the Indians

Finding the society determined to carry out the new policy, Mr. Duncan resigned. He returned, however, at the earnest request of the Indians, and formed a native independent church, being followed by all but a small minority of the Metlakahtlans. The Church of England laying claim to some of the most valuable land in the village, it was decided to once more remove, and to seek a new home under the fostering care of the United States. In 1886 Mr. Duncan went to Washington to obtain permission to settle on an island in Alaska which the Indians had reported as suitable for a new colony. His request was warmly seconded by Henry Ward Beecher and other public-spirited men, and he was given permission to locate on Annette Island, or New Metlakahtla, about one hundred miles north of the old site.

In 1887 the exodus occurred, at great personal sacrifice, but with much joy at the thought of spiritual freedom and of becoming citizens of a free republic. The island was then a wilderness, but under the willing and skilled hands of the Indians a new city sprang up as if by magic, and it is to-day far more beautiful than was the old one.

The intellectual and social condition of the Metlakahtla Indians to-day is a continual surprise to the visitor. They are mentally far superior to the red men of the plains. They are clear reasoners, fluent talkers and wonderfully adept in mastering new arts and industries. Their energy seems inexhaustible, being doubtless the result of centuries of life in the open air. Many of those I met at Metlakahtla do double work and think nothing of it. After working all day at the cannery or sawmill they go home, eat a hasty supper, and then toil cheerfully for several hours over some private enterprise. For example, the blacksmith at the cannery, who by day hammers out iron bolts and bars, spends his evenings and early mornings engraving and molding silver spoons. The village photographer—who also leads the Metlakahtla Band and plays the pipe-organ in the church—does not disdain to work at the cannery during the day, while he develops plates for tourists by lamp-light. There are eight Indian stores in the village, but during my visit they were closed all day,

while the owners were earning good wages, and open only in the evening. The Metlakahtla Brass Band is far and away the best in Alaska, and boasts that under its different leaders it has taught ten other native bands.

The social life of the people I found to be less stolid and more emotional than expected. I saw considerable of the nine Indian girls who attended the boarding school supported by Mr. Duncan, and they certainly appeared to be as jolly and outspoken among themselves as an equal number of American girls would have been; while I was constantly delighted and astonished at the beauty and brightness and vivacity of the grandchildren of the original converts.

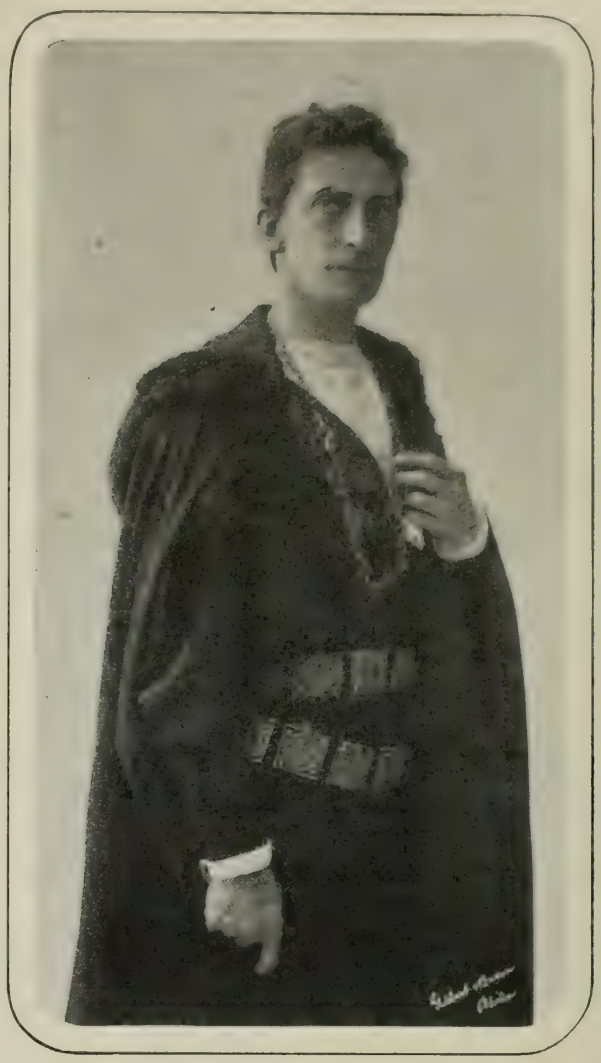
The city is governed by a native council, which is elected yearly, Mr. Duncan being the unofficial but virtual head.

The extent and variety of Mr. Duncan's activity at 72 years of age, and in view of all he has endured during the course of his 46 years of arduous labor, is remarkable. He still preaches twice each Sunday, besides being superintendent of the intermediate and junior departments of the Sunday school. On Wednesday evening he leads the mid-week prayer-meeting, and as the spiritual overseer of the people visits the sick, buries the dead, and settles all differences and difficulties. In addition to all this he is the active manager of the salmon cannery, the saw-mill and the chief village store; the sole judge of the people, and the mayor of the city.

When the investigating committee of United States Senators visited Alaska last summer they made a special trip to Metlakahtla, both to see what is doubtless the most remarkable Indian city in the world and to obtain Mr. Duncan's views on Alaskan conditions and needs.

Mr. Duncan believes mission work all over the world should be carried on according to the model Christian village plan. He declares the plan of separation is the divine one, as was shown in God's calling Abraham from Ur of the Chaldees and the Children of Israel from Egypt to Palestine.

CHICAGO, ILL.



Music, Art and Drama

The Month's Drama

Forbes Robertson's "Hamlet" is easily the foremost dramatic production brought out in New York this winter. It is, indeed, the greatest "Hamlet" seen in this country since the earlier days of Edwin Booth. Booth's "Hamlet" was always fine, but in his later years stage mannerisms grew upon him and detracted from the matchless grace and genius of the "Hamlet" of his youth. But since his time none of those who have attempted this great part in New York has approached Robertson. His appreciation of the character is subtle and intellectual; his acting nobly natural and simple, never prosaic or commonplace. It is impossible to praise too highly the beautiful naturalness of his method. It is the "Hamlet" of Shakespeare, and it is the "Hamlet" of this time and of all time. "Hamlet," as Robertson shows him, is a man any one may have known. Such natures, too intellectual, too emotional and too noble for this coarse world, pensive with the mystery of life and death, live in all ages, and Robertson comprehends them well. The fine intelligence with which the great soliloquies—those supreme tests of an actor—are given, and the splendid fire and passion of the scenes where the movement of the play is swift, like those, for instance, when the Ghost appears, entitle Robertson to very high rank as an actor. Mrs. Robertson played the part of "Ophelia" with grace and feeling, the entire company gave a good support, and

all the accessories of the play were characterized by taste and refinement. The American public may well be deeply grateful for so admirable a production of the greatest play ever written.

Shakespeare, indeed, has had unusual honors paid him at the New York theaters this winter. "Much Ado About Nothing" was produced by the Century Players, and "As You Like It" by the company of Miss Matthison and Mr. Greet; so that three of Shakespeare's greatest plays were running at one time in this city—an event which had not happened for a long while before. "Much Ado About Nothing" was admirably played by the Century Players. The "Beatrice" of Miss Jessie Millward, like all the work of that finished actress, was capital, and the company, as a whole, was of a high grade of excellence. Miss Matthison's "Rosalind" was intelligent, fresh and interesting, and the lovely old play was, in all respects, well produced.

Forbes Robertson as "Hamlet."

Miss Matthison's company followed "As You Like It" with a fine production of Goldsmith's "She Stoops to Conquer." This company has done excellent work this winter producing great plays and acting them well.

One of the objects of the establishment of the stock company of the Century Players was to produce, in addition to Shakespeare, some of the best plays of modern European dramatists. This attempt to elevate the drama was financially a failure, and the company was forced to disband. It was, perhaps, unwise to begin with "Rosmersholm," which, tho not so familiar as some of Ibsen's plays, is the most morbid and inherently disagreeable of them all. It was artistically and creditably played, and as a whole was very impressive, probably too much so, for the average playgoer has troubles enough of his own and prefers to read of suicides in the papers rather than to hear of them from the stage. Sudermann's "Battle of Butterflies," which was to have been given next, would have been more interesting to the public.

Henry Miller is a good actor. The play of "Man Proposes," in which he has recently appeared, is somewhat amateurish, but is upon the whole worth seeing.

It must be a very jaded playgoer who could not enjoy "Cousin Kate" at the Hudson. Ethel Barrymore enthralls us as she puts before us the archetypal woman, "full of whispers and of shadows." To realize that Ethel Barrymore *is* the play one need only to imagine her *rôle* being taken by somebody else.

The Ajax of Sophocles in New York

Seldom has a play of repute been produced in New York under more interesting and more unique circumstances than the "Ajax" of Sophocles, under the direction of Miss Mabel Hay Barrows. The play has never been given in any college in this country, and was brought

out for the "first time" by Miss Barrows at Hull House, Chicago, in December last. It was given in New York, as in Chicago, simply as a phase of the educational work of the social settlements. The thirty-one actors were all native Greeks with the exception of Miss Barrows, who took the part of "Tecmessa," and one other member of the cast, an Italian by birth but who had lived twenty years in Athens. Not one of the actors was a professional. All were drawn from the varied walks of life of the New York Greeks. The play was not given in a theater, but in Clinton Hall, the new Social Hall of the settlement workers on Clinton Street, on the East Side, in the very heart of the new Jerusalem of New York. The undertaking involved immense labor, but was supported by a committee of eighty, representing the highest intellectual and social life of New York.

The "Ajax" is a drama of immense power and worthy of the greatest efforts of the greatest actors. The remarkable thing about the four performances on the East Side was that the principal parts were taken with a dramatic power and reserve and the choral parts with a seriousness and unity which commanded the respect and commendation of distinguished critics, while fidelity to Greek tradition satisfied the exacting archeologist, except on disputed points of minor importance. To the hearer who had never read or even heard of Sophocles the representation was one of beauty and dignity. The music, set to old Greek modes by Willys Peck Kent and rendered by four clarinets, the chorus singing in unison, was fitted to the rhythm and the spirit of the lines.

One who reads the "Ajax" inevitably feels the pathos which Sophocles has put into the character of "Tecmessa," the wife of "Ajax." In Chicago Miss Barrows strictly followed the tradition of the Greek stage in excluding women from the cast, and assigned this part to a young man. The result was to show what the Greeks subsequently found out, that to do this is to sacrifice the literary delineation of the author to a mere stage archaism. In New York Miss Barrows took the part of "Tecmessa" herself, giving a more faithful reflection of the character drawn by Sophocles, which loses inevitably in anything but a purely feminine rendering.

Ajax of Sophocles.—The Meeting of Odysseus and Teukros (with bow), after permission was granted by Agamemnon for the burial of Ajax with sacred rites. The wife and son of Ajax appear at the immediate right of Odysseus. Fluters on the left and chorus on the right of illustration

Society of American Artists' Exhibition

No annual exhibition in New York gives us all the best work of the year, but the Society does show the highest average and reveals to us certain phases of the mind of the American painter that is cause for some thankfulness. At least we can learn that the American painter is free from the literary bias and the slavery of French classicism, even when his work has been founded upon it. In tone he is generally successful, whether he handles color in a high or a low key.

He is more often interested in the figure as a portrait problem than as a pictorial motive, and his occasional attempts to combine the two ideas are very often lamentable. Landscapes, again, are more often records of a realistically seen place under some effect of light generally well understood than visions of a beauty of which nature might be considered only the vehicle—there are few romanticists among the Society's exhibitors. For that reason the one or two who were admitted gain a certain value. To such a class belong two pictures, hung foolishly in the little west gallery—the "Parapet on the Brook," by Lewis Cohen, which is one of the few landscapes that is something besides a faithful study, and "The Sea and the Rock," by Benjamin Eggleston, which is a stirring picture as well as a good one. In this gallery also are two pictures by H. O. Tanner, the negro painter, which are almost the only historical pictures at the exhibition, and among the best. "The Christ on the Road to Bethany" is one of the most satisfactory canvases in its sincerity and the most deeply religious in sentiment seen in a long time. It has the breadth and the intensity which most American pictures lack. The "Daniel in the Lion's Den" makes less appeal but is a fine thing.

"Ajax" and "Tecmessa"

Of the landscape painters, who are of another school, Ochtman won the Webb prize with "The Autumn Sunrise," a picture less of a success than, in his way, he often produces. For the faithfully studied aspect of a very American landscape Carlsen's "Connecticut Hilltop" is a better picture. Big yellow maples have not before been so convincingly characterized, but the distance lacks movement, altho its simplicity of color is better in the way it fails than a more involved scheme might allow. There is a landscape in the south gallery, "Tree and Rock," by Edwin Adam Kramer, that suggests possibilities for its painter's future, tho it is weak in all respects except in conviction. Lawson's "Spring" is not so good as are some of his pictures. It is not a good landscape year. There are no conspicuously good marines.

With only four or five nudes in the show, it means much that there are two such very good ones as "The Green Cushion," by Cox—a little masterpiece of flesh painting—and the "Byblis," by Louis Loeb, an individual picture of great beauty of color and arrangement.

Portraits are very numerous and most of them are as bad as usual, but the presence of the great Sargent, "The Three Misses Hunter," seen in Philadelphia, is an event. Distinctly a noble picture is

Mr. Brush's group of five children and their mother, seen before, but altered in some ways since. Not as successful as his less complicated earlier compositions, it is still a splendidly sincere and moving picture. Macmonnies's round Madonna group is strangely pretty tho weak for him. Interpretative of the very essence of the sweetness of a child's personality is Janet Wheeler's portrait of Jane Gordon Coxe. This painter has a warm color quality that adds to the emotional value of her work. Hopkinson's portrait of Mr. Caswell and his little son is frankly good, even to the dog. Tho hard in some ways, it has only to be compared with such canvases as Thorne's portrait of the Gould children with their dog, and Butler's portrait of his wife and son, to shine conspicuously as an honestly seen work. The best thing yet shown by Henri—the portrait of the young woman in black—is, next to the Sargent, the most interesting event of the exhibition in the list of portraits. Portraits by Glackens, Ellen Emmet, Jean McLean, Matilda Brown, Montague Flagg, Johansen, of Chicago; Sloan, Chase, Miller and Jongers are of varying degrees of merit.

The prize figure picture by Curran is in his usual style. Very beautiful in color and sentiment are some pictures of East Side life by Jerome Myers—deeply felt impressions rendered with a fine eye for effective mass in tone.

The Julia A. Shaw prize goes this year to an unusually fine one of Bessie Potter Vonnoh's bronze groups, called "Enthroned"—a mother whose children nestle lovingly close—very broadly handled in spite of its small size.

"Ten American Painters"

The work of one little band of artists not represented at the Society was shown at Durand-Ruel's during March, and they carried their sensitiveness to surroundings to the point of changing the color scheme of the gallery itself from its usual insistent reds. Dull brownish pink velvet covered the fauteuils in the middle of the room, and the removal of the floor covering, altho queer little patterns in the marquetry obtruded, banished the hot reflections that always affected high-keyed work shown there. Seen in good color conditions thus, the paintings of these seceders from the society seemed sane and honest.

Such a piece of delicate painting as "The Rose Colored Bodice," by J. Alden Weir, is not paralleled in the exhibition in Fifty-seventh Street. The rose that suggested the name is not the deep pink one associated usually with the word, but the delicately tinted creamy one verging only upon pink. It was a poetic color thought that was expressed, not merely a literal view or a joy in technic. Benson is steadily improving. His "Woman in Black Hat" was a little too many-colored, but his whites were beautiful. Tarbell also was better this year in his heads. His orchard group had a raw literalness that hurt appreciation of its truth of values. Reid showed a predilection for a set of rather cold purples, but was not really well represented in this exhibition. Decamp's portrait of Mr. Baker was good, solid work. In his "Blue Locket" a very ugly forearm and hand insisted upon making more impression than the good quality of the picture as a whole. Hassam's usual mannerisms were present in his numerous landscapes, but the "Moonrise at Sunset" was beautiful, even tho the stiff-backed nude in the picture might only be called quaint. Metcalf's work had the least individuality, Dewing's perhaps the most. He had here only the lid of the White House piano upon the decoration of which he has long been at work, but he has understood perfectly his problem of painting a delicate dream for a gold setting, and the play through the colors in their tenderly sounded scale was exquisite. The dead poet-painter, Twachtman, was recalled by the presence of one of his "waterfalls." Only Simmons of the original "Ten" was unrepresented.

Arts and Crafts Exhibition

The Guild of Arts and Crafts of New York held its fourth annual exhibition and sale at the Guild House, No. 109 East Twenty-third Street, from March 22d to March 26th, inclusive. The exhibition was especially excellent in American keramics, the products of the leading pottery establishments and some very clever amateurs. In addition there was an excellent number of examples of various

other handicrafts—viz., basketry, bookbindings, batiks, bead work, embroideries, enamels, furniture, bronze and other metal work, porcelains, stencils, textiles, wrought leathers, wood carvings, etc. The exhibition was one in which the popularity of the arts and crafts movement as well as its persistency was illustrated. Typical examples were shown of the Dedham Pottery, with its characteristic crackle, the Van Briggle ware, Moravian, Merimac, Newcombe, Grueby, Losanti, Poillon and Volkman wares. New potteries by Miss Mason, Mr. Davis and Mr. Fry were interesting features of the showing. A number of small pottery objects made at the State School of Clay Working and Ceramics at Alfred, N. Y., were publicly exhibited for the first time.

The Guild of Arts and Crafts is an association of craftsmen co-operating to maintain a standard which shall be expressed in the union of the art of design with the art of production. To this end it has established workshops and salesrooms in a guild house in order that the educational and professional aims may be harmoniously developed.

Strauss's "Domestic Symphony"

At the final concert of the "Strauss Festival," given in Carnegie Hall on Monday evening, March 21st, the culminating point of Dr. Richard Strauss's visit to America was reached with the first performance anywhere of his latest orchestral composition—the "Sinfonia Domestica," which in the world of music had been a subject for speculation for a year past. Without going into the technicalities of its structural or thematic analysis it may be said at once that this work is as daringly original and as remarkable in its musical ideas and their exposition as anything that preceded it from the pen of this remarkable musician. In it, in some respects, indeed, the composer has advanced beyond anything attained to in his other works. Indeed, one shudders to think what any further advance could be beyond this sort of thing. It shows a profounder musicianship, a larger command over the resources of orchestral writing than anything Straus has yet done.

The full title of the piece as Dr. Strauss wishes it to stand, is "Sinfonia Domestica, Dedicated to My Dear Wife and Our Boy, Opus 53." It bears also the descriptive sub-title, "In one movement and three subdivisions: (a) Introduction and Scherzo; (b) Adagio; (c) Double Fugue and Finale." Its composer has gone far afield from the orthodox symphonic form and produced in reality another gigantic "tone-poem" of the order of his own invention. "Purely as music" it is big and noble and beautiful. There are dissonances in it, to be sure. There are some crashing discords. But there is melody in it that often flows smoothly in a current of limpid beauty. It is "psychological" or "dramatic" melody, not the melody of the dance or the march. Its themes are interesting and pleasing to the cultivated ear. They are wonderfully plastic, yielding under manipulation some amazing results. Much of the music is informed by a humorous intention, a cheery, mirthful spirit. It is sunny.

There should be no quarrel with the title of this work. If Beethoven could write symphonies "Heroic" and "Pastoral," Mendelssohn a "Reformation" symphony, Goldmark a "Rustic Wedding" symphony, Rubinstein an "Ocean" symphony, and Raff a series of symphonies named for the four seasons, why should not Richard Strauss write a "Domestic" symphony? And his treatment of it is in keeping with his theme. The score calls for an orchestra of 108 players and use is made of such novel instruments as the oboe d'amore and the saxophone. The whole band is employed now and again to work up a mighty and inspiriting climax. The critic who cried out against such a waste of tremendous orchestral resources and the composer's transcendent technic that "If he had been writing of the Judgment Day he could not have done more," must have been a poor, benighted bachelor, who could not appreciate the fact that happy domestic life is the grandest, noblest, lofetiest experience known to humanity, and is far worthier of poetic or musical delineation than the bloody butcheries of a Napoleon, however "heroic" such a figure may appear.

The whole work is music of the highest kind, created by a master musician,

Literature

The Reformation

THE second volume of the Cambridge Modern History * deals with the period of the Reformation in Europe. The limits of time are pretty strictly set to cover what we ordinarily call the Reformation proper, without including the preparations for reform that reach back into the two centuries preceding the sixteenth. These may be thought sufficiently treated in the first volume, but it is one of the natural consequences of the scheme of this whole great work that continuities of every kind have had to be sacrificed to its central idea of division of authorship. The result is that this volume, like its predecessor, is a thing of shreds and patches. It contains nineteen chapters written by thirteen authors. Individually these writers are men of good, some of them of first-rate, standing as historical students. The names of F. W. Maitland and James Gairdner are names to conjure with, but one cannot help feeling that this is precisely the use that has been made of them here, to carry weight sufficient to counterbalance the lightness of many of their collaborators. The opening chapter is written by the late Prof. F. X. Kraus, of Munich, and deals with the papal situation on the eve of the Reformation. The Catholic author presents in plain, uncontroversial language the degraded condition of the papal office and the pressure for reform that was making itself felt in many quarters. Mr. Stanley Leathes follows with two chapters on the conflicts of Charles V and Francis I and their continuation down to the Treaty of Cateau-Cambresis in 1559. The next five chapters treat of the German movement. That on Luther is by Principal Lindsay of the Glasgow College of the United Free Church of Scotland. It is a straightforward, rather conventional presentation, without special reference to the discussions as to Luther's personal and mental character, but leaving a clear impression of him as a sound mind, with a temperament open alike to the influences of enthusiasm and to the restraints of reason. The other four chapters, by Prof. A. F. Pollard of University College, London, trace the social and political development of the German Reform down to the Peace of Augsburg in 1555. Then follow four chapters dealing respectively with the Reformation in France, Switzerland, Geneva and the Catholic South, inevitably in each case only the briefest sketch and therefore leaving but a slight impression. The editors have found it necessary to apologize for their very natural wish to give as much space as possible to the English Reformation, but the reader is likely to find the four chapters on that subject among the most satisfactory of the volume. Dr. Gairdner deals with Henry VIII without personal *animus,* but with the intention of showing how the king's policy reveals a theory of government that meant more for England's development than any mere personal motives can account for. Professor Maitland combines with his treatment of the Anglican settlement under Elizabeth an account of the Scottish Reformation, which brings out the vital connection of these two factors in the new religious life of the kingdom. The Counter-reformation in the Catholic Church is described by Mr. R. V. Laurence in one chapter, an amount of space quite inadequate for this most important conclusion to any full discussion of the Reformation.

Criticism of a work such as this is necessarily limited mainly to its plan and scope. It is an experiment on a large scale in the field of co-operative historical writing. It rests upon the assumption that the problem of satisfactorily treating such a subject as the Protestant Reformation in one large volume by one author is insoluble, and that, therefore, there is nothing for it but a division of labor. This assumption, however, is not yet proven, and will not be until individual writers of equal ability with the best of these contributors have tried their

* THE REFORMATION. *Cambridge Modern History. Vol. II. Planned by the Late Lord Acton.* New York: The Macmillan Company. $4.00.

hands at the task. The real question is whether readers are going permanently to prefer a volume vouched for mainly by the reputation of editors and publishers to one that carries weight by the historical and literary character of one important author. The appeal here is the journalistic one; the enterprise is one of editing rather than of writing, and judgment must be passed upon a multitude of "contributions" rather than upon a work of consistent literary and scholarly skill. We cannot believe that, as between these two ideals of historical writing, the reading world will be long in doubt. Probably these volumes will fill a certain interim demand, but with the revival of good historical composition that is sure to follow the present activity in collection and interpretation the importance of the individual historian is going to reassert itself. Then we may look with confidence for a return to the interest in history that once gathered about the names of men who could really write it so as to command the attention of the best minds among their fellows.

A word of approval ought to be given to the excellent and full bibliographies, which, we are inclined to think, will be found by scholars by far the most useful part of the volume.

The Belles-Lettres Series.

THESE volumes* are the first two issues of Messrs. D. C. Heath and Company's new "Belles-Lettres Series." The idea of this undertaking is an excellent one—three hundred volumes containing the most important works of English literature, uniformly printed and bound, and, as we may hope after examining these issues, uniformly edited, a representative collection at once cheap and presentable, readable and scholarly. The whole subject is divided into six sections, as follows: Anglo-Saxon, Middle English, English Drama, Literary, Criticism, and Critical Theory, with sections fifth and sixth yet to be announced. We must confess that the plan of representing Anglo-Saxon, and even Middle English, in a series of this kind seems somewhat unpractical, unless such volumes are intended partly as text-books, tho there may be more of a demand for a popular low priced edition of the literature of these periods than we are aware of. Each section is provided with a general overseer, while the several issues have each its particular editor. The volumes before us are of a handy size, very neatly bound, and well printed in a large, clear type. The page, however, strikes us as rather small, at least for drama. And as this is a reading edition and the notes are few and necessary, it would be a decided advantage to have them at the foot of the page, where one could get at them without being obliged to turn forward every few minutes.

Of these two samples, furthermore, the editing is with a few exceptions unusually satisfactory. The introductions are not, to be sure, ideal pieces of criticism—in fact, a genuinely critical spirit is what they most lack; but where is that to be found nowadays? And in compensation they provide all necessary information in regard to the conditions under which the plays were produced, and afford in so far a point of view for appreciative reading. It may perhaps be doubted whether in the case of Jonson the partial return to the primitive text is an unmixed blessing, for since the capitalization and punctuation have been modernized we have neither one thing nor the other, and the sixteenth century spelling, whether of printers or authors, is not always a sufficient clue to the mysteries of linguistic growth. Occasionally, too, in their laudable endeavor to avoid a superfluity of notes the editors have fallen into the opposite fault. For instance, the only comment we can find on the allusion to Bayes in the epilogue of "She Stoops to Conquer" is the following in the glossary: "Bayes, a character in Buckingham's *Rehearsal;* here used for 'poet' or 'dramatist.'" But surely it is not a matter of indifference to the general reader that the Bayes of the "Rehearsal" was Dryden, who was then the laureate and to whom the name stuck for the rest of his life.

But these are small blemishes; and if we are to judge a whole by a

part, the series, as well by its accomplishment as its design, deserves the support of those for whom it was planned—those who are interested in "literature for literature's sake."

Social Diseases and Marriage. Social Prophylaxis. By Prince S. A. Morrow, A.M., M.D., Emeritus Professor of Genito-Urinary Diseases in the University and Bellevue Hospital Medical College, New York; Surgeon to the City Hospital, etc. New York and Philadelphia: Lea Brothers & Co., 1904.

At the end of his preface the author of this book says: "As regards the title chosen for this work, it may be said that the term social evil has been generally accepted and sanctioned by common usage, and it would seem appropriate that the diseases which are peculiarly the appanage of this evil should be classed as social diseases." Great advances have been made in the medical knowledge of the significance of these affections which are so serious for social and family life within the last twenty-five years. There has been need of an authoritative work to which those whose training did not give them this special modern knowledge could turn in order to find out the present attitude of the medical profession toward affections at one time thought to be of no more than passing consequence. This authoritative reference book is undoubtedly furnished by the present volume, which contains in language intelligible to the non-medical reader all that is now known of these diseases without exaggeration and yet without any prudish concealment of details necessary to complete the true picture. The question of race suicide and how much of it may be due to these latent evils in the social body is very thoroughly discussed, and the possible remedies, legal and social, pointed out. There is much that is appalling in a work of this kind, since it shows how widespread are the physical evils inevitably connected with the social evil. Such information is often supposed not to be quite proper for those who are not especially interested in medicine. The dangers, however, are constantly present in large city life, and it is a matter of the merest common sense that some knowledge of the means of avoidance and suppression should be afforded. This is especially true for young men who, in these modern days, with the universities unfortunately situated as a rule in large cities, are exposed not only to moral but to physical evils, of whose consequences they have no adequate notion and no possible means of obtaining the necessary information that would help them so much in the severe moral trial they have to face. Dr. Morrow's book will in this matter prove an undoubted source of ethical benefit of a very practical character.

Ultimate Conceptions of Faith. By George A. Gordon. Boston: Houghton, Mifflin & Co., $1.30 net.

It is impossible not to like Dr. Gordon's book and to like Dr. Gordon for it. He plunges *in medias res* and will not allow theology to be concerned with small affairs. He values his heritage as a New England preacher, and feels that the traditions of the Congregational ministry do not allow him to be a mere exhorter, but obligate him to have a consistent thought of the universe and to publish a system of reasoned belief for wide influence upon the Christian community. He is a loyal and devoted New Englander; he knows his Edwards and Taylor, and it is evidently his ambition to build on the foundation of the New England theology. Edwards and Ritschl figure in the index—an excellent addition to the book, by the way—in the proportion of ten to one, and it is the German who is spoken of with disparagement. Yet a broader, fairer man, one better informed, or one more truly appreciative of the significant in facts and in problems, it would be hard to find among preacher authors. Dr. Gordon does not mean by the title of his book that he has final statements of Christian truth to offer. His ultimate conceptions are ultimate in significance and importance; they are the "greater aspects of faith, which stand apart from the mass of minor things," "the vaster values of this life set in the life of God." It is helpful to one's courage to watch this attack on the last and largest realities, and to see a strong and lively optimism appear as the ultimate from history, moral principle emerge as the great, true word from the universe, and the

world become our Father's house. It is a new point of view when Christ is presented as the religious ultimate, tho the doctrine hence discerned is soundly orthodox, the "highest Christological tradition of the Church." The least satisfactory part of these Lyman Beecher Lectures, tho that on which the author lays great stress, is the argument for the Trinity in the final chapter. When we read of the "essential social nature of God," a "God with a society in Himself," and that "God is an infinite man," we must feel that Dr. Gordon has attempted what he declares is impossible,—"a psychology of God, a definition of the mode of the divine being;" and grateful tho we are for stimulus and uplift from his worthy thought and his manly spirit, we turn with fellow-feeling to the opening stanzas of Whittier's "Eternal Goodness":

"Who fathoms the Eternal Thought?
Who talks of scheme and plan?
The Lord is God! He needeth not
The poor device of man."

The Yoke: A Story of the Exodus. By Elizabeth Miller. Indianapolis: The Bobbs-Merrill Co., $1.50.

The days when Lowell wrote:

"He ought to let Scripture alone; 'tis self-slaughter,
For nobody likes Inspiration—and water!"

would appear to have passed. A large audience awaits the author who uses the Bible for the background of his story. In *The Yoke* we have another novel of the land of the Pharaohs, the Nile and the desert. Moses appears once or twice —a shadowy figure—Aaron and Miriam are on the stage several times, and the plagues that devastated the kingdom of the ruler who "hardened his heart" against the Israelites always come in the nick of time to help the minor personages of the story, who are entangled in the toils of a very good plot. A novel of such a period comes into competition with formidable predecessors, and suffers from it. The author has not that first hand knowledge of Egyptian archeology which gave Ebers's novels their importance, nor the strength of Glovatski, author of "Pharaoh and Priest." And we would throw aside these and all the other novels of ancient Egypt to read again that wonderful chapter by Andrew Lang or Rider Haggard where the Wanderer with the spear-point in his helmet sails out of the darkness up the blood-red Nile in search of "The World's Desire." Yet there is much painstaking work in the descriptive passages, the characters have character, and the tale is interesting. Certain flaws of diction somewhat jar upon the ear; as, "The Delta, thridded by the sea-hunting Nile," "the high-white light of Dawn was breaking upon the century-long night of Israel," "her figure had utter grace," "the marsh-hen was less apparent" (after it had been eaten!). It is worthy of note that all these quotations are from the first chapter. In many books the opening pages are decidedly the best, as if the author grew weary or careless toward the end of his task. *The Yoke* reverses the order and grows in interest as well as in care for details of diction.

The Rainbow Chasers. A Story of the Plains. By John H. Whitson. Boston: Little, Brown & Company, $1.50.

For accuracy of description and correctness of local color it would be impossible to beat this novel of the hundredth meridian. The author knows how the "Arkansaw Traveler" should be played, and how a real estate boom is worked. He depicts the prairie dog town, the mirage, the wild fire, the flood, the sod-house with the minuteness of a Dutch painter. The county-seat fight, the prohibition campaign, the mortgage industry and all the other peculiarities of Kansas politics and finance are included. A diligent search for errors by the reviewer, anxious to prove his competency as a critic, has resulted in the discovery of only one; that mammoth volume, vulgarly known as the "Herd Book," wherein are recorded the biographies of several thousand distinguished Kansans (at $12 apiece; $25 for portrait), is not by Webb Wilder, the author of "Annals of Kansas"; quite another kind of a book. Certain passages in the story, notably the narrative of the blizzard, are written very effectively. But something more is needed than accuracy of detail to make a story real. And this something is lacking. Therefore the story, tho sensational

in its plot and incident, is not interesting. The characters, tho lifelike, are not living. The style is poor, and there is nothing of the vividness and power of expression with which similar matter is treated by such authors as Kipling and Balestier in their description of rival towns in Naulahka, or William Allen White in his stories of Kansas politics. A word should be said in favor of the illustrations by Arthur E. Beecher, for they really illustrate the story and are equally veritistic.

A Bachelor in Arcady. By Halliwell Sutcliff. New York: Thomas Y. Crowell & Co., $1.50.

This is not one of those absorbing books which one feels the need of finishing at a single sitting. One can take it to bed and go tranquilly off to sleep in the middle of it, and if, next day, the maid mislays it in tidying the room, one does not greatly mind; it will be just as pleasant to finish it a week hence. Nevertheless, it has its own quiet charm. The bachelor who tells the story, a story of his life on his farm among the hedgerows of old England, is a man of wide sympathies and close observation. The birds, the flowers, his dogs and his cattle are all individuals to him, and he notes their characteristics with humor and true understanding. It is the kind of book that makes one feel that one would like to go and stay a while with the hero; to go hunting with him, to laugh with him over the absurd episodes of farm life, and, above all, to imbibe something of his mellow philosophy and delight in nature. One hardly knows whether to call it a nature book or a novel; probably the latter, for there is a daughter of a neighboring squire who slips in and out of the pages, and in the end the bachelor finds himself a benedict. The love affair, however, lacks conviction, and one feels that it was probably inserted in deference to the popular taste.

Cap'n Eri. A Story of the Coast. By Joseph C. Lincoln. New York: A. S. Barnes & Co., $1.50.

People ought to be very grateful to that particular upheaval of nature which gave to the world the little point of land called Cape Cod. It not only furnishes a delightful place in which to spend one's summer vacation, but out of its life have grown some of the pleasantest stories of coast life that were ever published. *Cap'n Eri* is a tale of three captains, who, having given up active sea life, have settled down on shore to keep house together—each of them being alone in the world. In time the duties of cooking and dish washing pall upon them; the house gets more and more dirty, and they are reduced to the expedient of advertising in a matrimonial journal for a woman to marry one of them and keep house for the three—first tossing up a penny to decide which of them shall be the socrifice. One of the letters received in answer is from a wholesome widow in a neighboring village, and it is she who in time marries Cap'n Eri, tho a good many things happen first. It is a regular Stocktonian situation, tho not treated in the Stocktonian manner. There is no hint of absurdity, but simple, original humor, and through it all that "touch of nature" which is the best appeal to almost every class of reader. Recent visitors to Cape Cod report that the bloom of that "local color" for which it has been famed is getting somewhat rubbed off by the constant influx of summer boarders; so one is the more glad to come across a book like this, in which Cape Cod types and Cape Cod atmosphere are preserved unspoiled.

Daphne: An Autumn Pastoral. By Margaret Sherwood. Boston: Houghton, Mifflin & Co., $1.00.

The very spirit of Italy breathes from the pages of this charming pastoral, and as we follow its heroine amid laurel and cypress, roses trailing over ancient ruins, and vineyards whence might have come old Massic and Folernian, it is easy to believe that the gods are not dead. Nothing less than Apollo, tho he appear clad in a brown golf suit, should be the hero of a romance which blossoms in the decaying amphitheatre of a palace of the Cæsars. And so it quite accords with our sense of the fitness of things to find him again on earth, keeping the flocks of a modern Admetus, allaying with his healing art the sufferings of the fever-smitten shepherd and the pain in a sprained feminine wrist, but busy the

while with the pagan witchery of his music in stealing the heart of a New York rector's daughter despite its defenses of a New England conscience and a High Church lover. It relieves the tension of supernatural awe cast over both reader and heroine by his earlier apparent omnipotence to find toward the end that this latter-day god is capable of very human grief and impotent despair when crossed in his love for a maid; but that, too, after all, is not so unlike Apollo.

Christian Thal. By M. S. Francis. New York: Longmans, Green & Co., $1.50.

The tiger woman in this story, with noble human elements in her, is the striking character in it. Defeated in an ambition to achieve a career for herself, this woman adopts Christian Thal with the determination to make him a great musical artist and to realize through him what she could not accomplish in her own person. But a beautiful maiden floats into Thal's life and exacts a love which to the tiger woman seems to threaten the art development of her *protégé* and which, of course, calls forth the hostility of her intense and powerful personality. This constitutes the situation from which the story is evolved. It is written with the even, sure stroke of the practiced writer, and, unlike many books which exploit the artistic temperament, it is morally wholesome.

Children of the Tenements. By Jacob A. Riis. Illustrated. New York: The Macmillan Co., $1.50.

The stories in this book have to do with many phases of life as seen in the crowded East Side and about Police Headquarters. They are true stories for the most part, tho, as the author confesses, he has sometimes woven a number of isolated episodes into a connected narrative. The heroism of firemen, the mutual helpfulness of the poor, the festivities of merry-makers, the infectious geniality that possesses all hearts at Christmas time, are some of the themes. One of the tales, "Little Will's Message," is a gem of simple and pathetic narration. As it reads, it is somewhat too good to be true, but let us hope that the main incident really happened, and that through the kindness of a captain of detectives the joys of Christmas did actually descend upon three little starving children of an ex-convict, huddled in a fireless room in the gas-house district. The other stories are of varying degrees of merit, and a number might better have been omitted altogether.

Pebbles

Nibs: "Didn't you say Jones was a corker?" *Fibs:* "Yes, he works in a bottling factory."—*Princeton Tiger.*

The toad is squashy and fat and brown,
He's covered with dimples upside down,
And when he's stepped on, in the road,—
Oh, Gee! I'm glad I ain't a toad!

The frog is really not so bad.
He paddles around on a lily-pad.
And tho he's slimy, he's nice and slim,
So, really, I wouldn't mind being him.
—*Yale Record.*

....A subscriber sends this in, who says it was written by her daughter, who is studying philosophy:

There was a young fellow named Bill,
Who did not believe in free will.
When asked to saw wood
He'd say, "Yes, if I could;
But I feel foreordained to sit still."

THE IDEAL SCHEDULE AS THE FACULTY WOULD HAVE IT.

A. M.
4.45—Arise, bathe, dress, and eat breakfast.
4.48—Having breakfast, etc., study three hours.
7.48—Study 52 minutes.
8.40—Chapel.
9-1—Lectures, lectures, recitations, lectures.
P. M.
1—Lunch.
1.04-1.37—Mild recreation, or familiar intercourse with classmates.
1.37-2.30—Recitation or lecture.
*2.30-2.37—Outdoor sports in season.
2.37-3.30—Lecture or recitation.
3.30-3.37—Conversation (about work) with instructor.
3.37-6—Laboratory work, recitations, or lectures.
6-6.05—Supper and Academic discourse with friends.
6.05-9—Study.
9-12—Work.
12-3—Grind.
3-4.45—Refreshing slumber.

* May be spent in library, if preferred.

Editorials

Two New Elements

It has been very humiliating to realize that, altho nearly eighty chemical elements are known to science, not one of them was discovered in this country. It was not a sufficient defense to say that all of them were discovered before the Americans entered the field. Within the period during which the last dozen of them have been isolated there have been as well equipped laboratories in the United States as anywhere else in the world. In fact, helium was first obtained by Dr. Hillebrand, of the United States Geological Survey, from clévite, before it was discovered by Prof. William Ramsay in England, but he supposed the gas he extracted to be nitrogen, which, in part, it was.

This week, Dr. Charles Baskerville, professor of chemistry in the University of North Carolina, announces to the Chemists' Club of New York that he has discovered two elements allied to thorium, and obtained like this element from monazite sand. Such discoveries are not made nowadays by accident, and this triumph is the result of ten years of exceedingly difficult and delicate work. He announced some years ago that what is known as thorium contained traces of another element, but it was only by the use of radio-activity as an instrument of research, according to the method we described last week, that the new element could be separated and purified, and then was found to be twin. He has prepared altogether about three grains of the salts. Professor Baskerville, working with Mr. George F. Kunz, one of the foremost mineralogists of the country, examined for their fluorescent properties under different kinds of radiation nearly all the minerals in the collection of the American Museum, and discovered in many instances that minerals of all kinds from particular localities possessed peculiar fluorescent properties, while the same minerals from other localities were unresponsive, indicating that the fluorescence was due to the presence of some element in minute quantities.

The new elements give out strong rays which penetrate wood or metal, act on the photographic plate, affect the eye like light and discharge electroscopes. Like the other radio-active elements, they probably have very high atomic weights and are similar to thorium, uranium, radium and polonium. According to the theory now held, large atoms like these are breaking up, giving off electrified particles and producing as products of decomposition helium and other gases.

A few years ago thorium was only known as a chemical curiosity. Now it is in almost every city home, for in the form of its oxide it constitutes about 99 per cent. of the Welsbach mantle, which, when heated in the gas flame to incandescence, gives off such a beautiful white light that gas is not likely yet to be displaced, as was once expected, by its rival electricity. It is probable that everyone who has a mantle burner possesses some of the new element.

It has been the custom recently for the discoverer of a new element to name it after his native land. Thus the three elements predicted by Mendeléeff were discovered by a German, a Frenchman and a Scandinavian, and therefore bear the names germanium, gallium and scandium. Madame Curie has no native land, for she is a Pole, but she followed the patriotic custom and named the element she discovered polonium. A Southerner is always more of a states-man than a nationalist, so Professor Baskerville calls one of his twin elements carolinium. The other he has named berzelium, after Berzelius, the Swedish chemist, who discovered thorium in 1828. It is unfortunate that the United States has no adjective. Americum would be am-

biguous, and columbium is already in use as a synomym for niobium, so we do not see how Professor Baskerville could have done better.

The Coal Railroads Case

THE decision of the Supreme Court in the case of the anthracite coal railroad companies is something that was to be desired for the promotion of justice and the good of the public. This is almost universally admitted. It is a decision that was obtained by Mr. Hearst. What were the motives that led him to begin and to press the prosecution we do not know. Some say he sought to increase the circulation of his newspapers, and to gain support for his political candidacy; others assert that he was moved by a desire to serve the public interest. Whatever his motive was, he has served the interests of the public, striving persistently with much determination of purpose, and paying all the costs. And he has done this work because the people's official representatives declined to do it.

What has thus far been gained? This decision touches the merits of the pending controversy only so far as it relates to the refusal of the companies to produce certain contracts and agreements. But it clearly establishes the right of any citizen—even if he be not directly injured by the alleged discrimination in rates or pooling of traffic—to file a complaint with the Interstate Commerce Commission and demand an investigation; it establishes the duty of the Commission to make inquiry in response to such a complaint; it empowers the Commission to demand the contracts, agreements and books of a railroad company with all the force of ample authority. Hereafter the Commission will not be constrained to rely upon chance information or the methods of a detective. If a company has undertaken to grant rebates or unlawful rates, no contract relating to these can lawfully be withheld from the Commission. The decision enforces publicity with respect to unjust agreements that tend to make monopolies. And the powers thus defined may also be exercised (as the statute says) by the new Bureau of Corporations.

It was in October, 1902, that Mr. Hearst, through his counsel, offered to lay before the Department of Justice documentary evidence that these coal railroad companies were violating the Anti-Trust law. That evidence included the contracts and agreements which the companies afterward, when before the Interstate Commerce Commission, declined to produce. The District Attorney at New York was instructed to receive it and to report as to its weight. He did so. No action has since been taken by the Department of Justice.

Assuming that the Government would not proceed against the companies under the Anti-Trust law, Mr. Hearst complained to the Interstate Commerce Commission, alleging that the same companies were violating the Interstate Commerce law by discrimination in rates, by pooling freight traffic, and in other ways. A hearing on this complaint was interrupted by the railroad companies' refusal to produce the contracts with the coal companies or those of the Temple Iron Company. In the Circuit Court Judge Lacombe ruled that the contracts were irrelevant in these proceedings, remarking significantly that those relating to the Temple Iron Company would be relevant "if the defendants were being prosecuted under the Sherman Anti-Trust act for entering into a combination, agreement, or contract in restraint of trade." It is his decision, sustaining the companies' refusal, that the Supreme Court has now reversed by an almost unanimous vote.

We have said that the official representatives of the people failed or declined to proceed against these companies. Ought the Department of Justice to have brought suit under the Anti-Trust law? This question may be answered in part by the argument of the Department's representative in New York, District Attorney Burnett, before Judge Lacombe, in which he asserted that the companies had combined by means of the Temple Iron Company "to suppress competition in the transportation of coal;" and in part by what the Supreme Court said in its decision of last week:

"As to the so-called Temple Iron Company contracts, it appears that in 1889 certain operators in the anthracite coal region organized a competing railroad, with a view to carrying their product from the coal region to market at tidewater. It became evident that this com-

pany was likely to succeed, and to construct a competing railroad from the coal fields to the sea. With a view to acquiring its property, five of the leading railroad carriers purchased the collieries whose proprietors were developing the new scheme. To pay for these, the charter of the Temple Iron Company was purchased and its capital stock was increased.

"The company issued a large amount of stock and bonds, and the contracting railroad companies agreed among themselves and with the Guaranty Trust Company of New York, as trustee, to guarantee a 6 per cent. dividend upon the Temple Iron Company stock and the payment of principal and interest of the bonds. This ended the building of an independent line, and the transportation of coal from the collieries is distributed among the carriers interested."

These remarks may indicate what the opinion of the court would be if it should ever be required to consider the bearing of the Anti-Trust law upon these railroad companies; but they relate to only one part—a kind of holding company—of what Judge Lacombe called the "machinery of the combination." Is there any one, familiar with the history of the anthracite trade, who is in doubt as to the existence of a combination agreement as to prices, freight charges, allotment and regulation of output?

We do not think a rigid enforcement, against railroad systems, of the Anti-Trust law as interpreted by recent decisions is to be desired for the public good. The interests of the people can be served more effectively by strict supervision and a regulation of rates. But if the Government leads the people to believe that it regards the law as a just and useful one, and shall then decline to enforce it where the people are convinced that unjust and harmful combinations exist, it must not be surprised to find Mr. Hearst receiving credit and enjoying popularity for such work as he has already done and for his purpose to do more of it. The situation is not improved by calling his followers "a Socialistic rabble." Many of them perceive his unfitness for the Presidential office, but are willing to overlook this for the reason that he is making their cause his own. He could not more surely commend himself to a majority of the American people than by attempting to enforce the law against a combination that always suggests to them the intolerable arrogance of a Baer.

A resolution of inquiry addressed to Mr. Knox, which has been introduced in the House by Mr. Hearst, gives the Attorney-General a good opportunity to send to Congress a frank statement in answer to certain questions which recent events suggest. For example, why the Anti-Trust law is not, and ought not, to be enforced against other combinations of parallel railways, which appear to be prohibited by the court's interpretation of it in the Northern Securities decision; why the criminal provisions of it, an application of which, Mr. Justice Holmes said, was a logical sequence of that decision, are not to be enforced; whether the law ought to be amended, as indicated by Mr. Justice Brewer's opinion, so that reasonable restraint of trade will not be forbidden; why the law cannot be used for the restraint of those combinations of manufacturers at which it was aimed, and whether he is still of the opinion that it could and ought to be made effective against such combinations by the imposition of that interstate transportation penalty which he once suggested, but which the Senate declined to consider. Such a statement is needed for the guidance of intelligent public opinion, and to make it there is no one more competent than Mr. Knox.

The Ideal of the Small Family

An article by Mrs. Commander, which we publish this week, presents an ideal which appears to prevail, but which it is not wholly pleasant to face, that of the small family. She tells us that, so far, at least, as the large city is concerned, and the higher and middle classes in it, the large family has become unfashionable; that married people, on the testimony of physicians who know, want two, or at the utmost three, children, or none at all; and that it is the improvident and most worthless class of the population that are freely productive, but whose children die in large numbers. She tells us, on such testimony, that the same ideal of small families is speedily accepted by foreign immigrants, Jew and Gentile. It is not regarded as "nice," she says, to be burdened with a large family. The fashion, when it allows any children at all, seems to be that of the man who said he would not take a mil-

lion dollars each for his two children, and would not give six cents for another.

These are provident parents, or possible parents, but is not their foresight much too short? Is the French ideal better than that of our grandparents? Is it better to have no children, or only one or two, than to have such families as created our nation? We would present a few considerations bearing on this subject.

Is it well that the human race should continue in existence through marriage and parenthood? Is it true that a man is better than a beast, and that it is well that the big, brainless brutes that ruled the elder age have been supplanted or are now themselves ruled by reasoning men? Is it well that the cultivated and populated earth should revert to the mastership of forest and python and tiger? Are men and women better worth raising than cattle?

If this question is answered with reason, let possible parents answer another. If all who live to reach the age suitable for parenthood should marry, how many children should each couple have to keep the population simply stable, without loss, supplying their own places for the next generation, and the places of those who die before reaching the age of marriage? And if a considerable number, for good reason or bad, shirk the privilege of marriage and parenthood, how many more children would be required for each family merely to supply the loss, with no increase of numbers?

Another question. If it is best, if it is a collective duty, that the world should be populated; if it is true that man is incomparably the supreme product of nature, on whom individually does the duty rest of supplying, through parenthood, this population? Is it a duty principally for the provident or for the improvident, for the superior or for the inferior, for the moral and intelligent and prosperous, or for the vicious and ignorant and penniless classes of our people? Is there an ethical consideration which should hope that the children of the honest, comfortable, conscientious classes should outnumber the children of the slums?

Once more, is the character which is implied and cultivated in the avoidance of the privilege of parenthood superior to that which comes from the acceptance of its responsibilities and burdens? If it be true, as students of ethics now tell us, that the sense of duty, of obligation to our kind, of that which makes conscience and right, has grown out of the obligations of the family relation, developing from the self-sacrifice and protection of beasts even for their mates and their offspring, is it not to be supposed that the care of children will best develop those qualities that make man and woman unselfish and noble; and is not this worth much consideration by those who are truly provident for the higher values of life? And do we not find that the office of father and mother actually develops these higher qualities of unselfishness and helpful self-sacrifice out of which grow the sweetest satisfactions of life, and which supply the finest examples for the honor and emulation of the young? Are not the parents who devote themselves to the training of children, and who must do it if they are worthy of children, more to be respected than those who, wilfully denying themselves the privilege of self-sacrifice, exhaust their energies in their own pleasures?

And yet again, is it not more than "nice," is it not grand and beautiful to see a family of many children growing about the household hearth? Should not the mother and father who have the power and will to raise and train such a family be proud to do so? There is task and suffering and sacrifice in it, but is not the fair product many-fold worth it all? What strength and honor like that of a father and mother thus ruling their household? What glory like the old age which is protected and crowned by the families of sons and daughters who bring their children to pay loving respect and support to declining years? That is the proud privilege of those who disdain not the pains and labors which ally man nearest to the creative majesty of God.

What, then, are the considerations that are producing the false ideal which Mrs. Commander observes and records? Why do we leave the maintenance or the increase of our population to the immigrant, or to the improvident or worthless, while those who can produce and train worthy children remain unmarried, or marry late in life, and have few children or none?

A chief reason why so many of the very

best women, who would make the best mothers, remain unmarried, is because there are not enough good and worthy men to provide them husbands. The fact is that there are two good, pure, high-minded women to one such man. Many such women do not meet the man worthy of them who can seek them in marriage, and they will not marry a man whom they cannot respect. They do right. The only remedy for this evil is the cultivation of nobler principles in our young men. This is the business, never too hopeful, of our schools and churches. There is no other remedy.

A kindred reason is the prudent selfishness of young men. They say that they cannot afford to marry on a small income as their fathers did. This "cannot" is simply a *will not*. It is what the theologians used to call a moral inability, wholly culpable. They pretend that young women are not willing to marry on a moderate income; but the real fact is that they are too selfish to deny themselves the liberties and the ease which marriage would abridge, and they prefer the despicable position of a nursling incumbrance on their father's family to the only dignified position for a grown man, that of head of a household; for an unmarried man is but half a man. And this results in late marriages, if the parties marry at all, and by that time prudence easily seems a duty, and children are few. Or, if they marry earlier, and they are well mated in love of comfortable ease, the restraints of home are too irksome to allow children to interrupt the pleasures and excitements of society life. They think it vulgar to have children grow up around them.

Those fathers do wisest who encourage their sons to marry early, who help them to do it, and who bid them seek their young partners who are fitted by ability, culture and character to be the willing mothers of worthy children. Those mothers do best who teach their daughters that they may hope to marry in the prime of their youth, and that their dolls suggest the mother love which they will give to their own children. Those parents are guilty of a great wrong to their children, to society and to the world who desire to keep their grown up sons and daughters about them, and do not teach them to forego the luxuries acquired by years of toil, that they may begin also in a humble scale of life, and also live frugally and honestly and nobly for their children and their children's children.

The Feminine Air

In the report of the Moseley Education Commission just published in London, the Commissioners remark on the late age to which coeducation of the sexes is continued here. They observe a result which they seem to deplore. Says Professor Armstrong:

> "The American boy is not being brought up to punch another boy's head or to stand after having his own punched. In a healthy proper manner there is a strange, indefinable feminine air coming over the men, a tendency toward a common, if I may call it, a sexless tone of thought."

We understand that in the English schools, where female teachers are disallowed, it is considered a good part of masculine education to train boys to punch each other's heads, and to enjoy having their own heads punched. Possibly this branch of education is not sufficiently encouraged in the United States, and we commend this point to the attention of our college presidents; and yet we wonder if Professor Armstrong attended one of the masculine school functions called a football game. It would have appeared to us that in this game, which represents the most honored branch of high school and college pedagogy, there is all of that healthy modicum of offensive vigor and patient endurance of pushes, punches and kicks which might be desired by an English education. Indeed, it has been proudly claimed that the American game is more manly and less feminine than the English.

That "feminine air coming over the men," and that "sexless tone of thought" are worth thinking of. We would like to know what it means; indeed, we can believe that the complaint is partly justified by the facts. But exactly what does it indicate? We know that in a tribe that lives by war the "feminine air" is very different from the masculine. It is submissive; it does not swagger about with weapons on edge for a fight. We

have observed this malign and leveling influence of civilization and culture, that it makes men more feminine, and women more masculine. The men that stop punching lose the air of punchers; they become peaceable and mild—may we say more Christian? That comes in time to produce a "sexless tone of thought," a harmonization of the interests and ideals of men and women, perhaps too much in line with the Beatitudes.

That old and wise moral philosopher, Cicero, somewhere remarks that he likes to see an old man who preserves something of the fire of youth, and a youth who possesses something of the gravity and foresight of age. Is it not a kindred excellence when the extremes of a sexful condition of society are merged in the comparatively sexless tone of thought which makes men more gentle, and women more independent than a cruder period cultivated or allowed? We may be pardoned for not being impressed by the value of the criticism, and for believing that the prolonged period of coeducation has a good result for decency and good order if it makes less of the ability to punch and be punched, and more of the courtesy and civility which belong to decent society. We less fear the feminization of our young men than we do the possible infection of the young women in coeducational institutions with some of the lawless and rude customs with which boys too often celebrate their class rivalries.

The Anglo-French Treaty

BEFORE the treaty between Great Britain and France was signed, its provisions were allowed to become public so far as to assure the two Cabinets that it would meet popular approval. Our readers have already been informed of its nature, and what we have now to consider is its effect on the politics of the world beyond the signatory Powers.

The things settled are of no very great importance, except as they have been the occasion of friction. The French occupation of a fraction of the Newfoundland coast was a small matter, and so was the non-acquiescent French sentiment over the British control of Egypt. Now this is accepted, and England will be free to use the surplus of Egyptian funds for economic purposes. French interests in Morocco are recognized, but England loses no commercial or strategic advantage. The chief French gain is in access to Lake Tchad and the interior of Africa by a new seaport; but none of these matters were worth fighting or quarreling over.

The chief advantage of this new treaty, following the treaty of arbitration, is that it assures friendly relations between the two countries. This jealousy, not to say hostility, was wholly unreasonable. They are closest neighbors, and multitudes of Englishmen spend their winters in France. The quick and complete reversal of the bitterness lately existing is evidence how little real reason there was for it.

But the *rapprochement* of France and Great Britain seems also to indicate the weakening of the bands that tied France to Russia. France leaned on Russia for protection against Germany, and Russia has used France for her own ends. Since the war of 1870 France has become the greatest colonizing Power in the world after Great Britain, and has created a navy second only to the English. With her increased strength and with the new good will of Great Britain, France does not so much need to depend on Russia. Indeed, her interests and those of Russia are not the same.

It is not strange that the Russian war party is troubled by this new development. Russia is now engaged in a most serious war, and may need the help of France. But that help she will not get, for France and Great Britain are agreed to limit the scene of war. Russia must fight her battle with Japan alone, and under serious disadvantages. If she wants moral aid, or anything more, she must look to Germany. Russia feels that Great Britain is her one foe, who disputes with her the Empire of Asia, and who stands in the way of possession of Pekin. Great Britain and Japan stand together to protect China from dismemberment, and doubly angry is Russia that at this hour of her trial the British are moving on Tibet. That France should just now ally herself with Great Britain seems to the war-lords of Russia like desertion and treachery.

But yet it makes for the peace and welfare of the world, for Russia is not with

but against the world, and will continue to be until the well-meaning Czar begins really to rule. Germany can hardly do anything to help Russia. She may supplant France in the alliance of the latter with Russia, but she will give no substantial aid. Russia may try to combine the Continental nations to withstand the Anglo-Saxon Peril, which they now pretend to fear even as do they the Yellow Peril; but without France and Italy and Spain and Holland and Belgium and Scandinavia and Switzerland, which will have no part in a commercial boycott, Great Britain and the United States have no reason to fear. Russia is just now like an overgrown whale pursued by a venturesome sword-fish, and the other fishes of the sea are glad to agree to keep out of the way of the thresh of tail and the thrust of sword.

Farm Colonies

THE drift of the city countryward is finding a new expression in co-operative colonizing. Colonies have, as a rule, not succeeded well in the United States; but those undertaken with a clear understanding of the social problem are getting a permanent hold upon the soil. The Salvation Army organized its first colony in the United States in 1898. Its object was not to gather a group of sympathetic reformers, men with crotchets in their heads, and endeavor to work out a harmonious result; it aimed merely to give an opportunity for worthy families to become home-owners, under favorable conditions. The real problem of poverty does not concern unmarried individuals, but families that have children to feed and for whom clothing and education must be provided. There are thousands of these families, huddled together in single rooms in the tenements of our larger cities. They sleep on the floor as a rule, and with inadequate clothing. Their food is of the cheapest sort and unfitted to sustain physical vigor. The colonizing efforts of the Salvation Army are based on the idea that families should not be broken up in the effort to save individuals—that the congestion of city life can best be relieved by moving whole families to neighborhoods where they can be taught better methods of production. Mr. Booth's maxim is

> "Place the waste labor on the waste land, by means of the waste capital, and thereby convert the trinity of waste into a unity of production."

At Fort Amity, Colorado, the colony farm consists of two thousand acres, along the line of the Atchison, Topeka and Santa Fé R. R. This farm is situated in the valley of the Arkansas River and is capable of almost unlimited expansion. The soil is rich and the climate is superb. The market for farm products is of the best, as the principal cattle markets of the Western States can be reached, while shipments of beets and melons can be made to Eastern markets. Alfalfa thrives in this section as almost nowhere else in the world, producing the best of butter and honey, and fattening the cattle with three or four croppings a year. The prairie soil produces magnificent crops of fruits, berries and vegetables. There are about three hundred colonists, including men, women and children, and the experiment is in every sense of the word a success. An orphanage has been erected at a cost of $20,000, based on the theory that orphans, marrying as they grow up, form the best of colonists. A credit association has been established—the first in America—on the plan of the Raiffeisen village loan associations of Germany. It is proposed to establish a sanitarium for laboring people. Adequate school houses have been erected, but these are to be united into a large union school. With all the rest postal money order service has been established. There are other colonies established in California and in Ohio. About twenty miles from Cleveland the owners of a beautiful strip of land, fringed with wood, deeded the same to the Salvation Army, while other citizens of Cleveland donated twenty thousand dollars in money. This colony is at present in its incipient stages, but promises to be most important in its results.

It must be understood that the object is not simply charity toward a few people, but is intended to be an experiment in the way of drafting surplus population from the larger cities. It is understood by social reformers that the tide countryward has so far taken hold only of the well-to-do classes, and has had very little

effect upon the very poor. The steam age herded these people where labor was most easily obtained, very decidedly weakening the power for individual enterprise. The deepest difficulty in the way of inducing the day laborer to leave the city is not lack of rapid transit, but the lack of capital for enterprises that are open before him in the country. He is alike without taste for, and experience in, agricultural affairs. The Farm Colony undertakes to meet these difficulties by moving families instead of individuals, and by such loans as will enable them to get a start in land culture. This scheme has proved to be a wise one. The family will in the long run prove to be an economic organization—the wife and children furnishing unpaid labor.

Mr. Booth reports:

"A father cultivating his own land, while the children are earning money by picking berries for a neighboring farmer; the wife looking after the home, the poultry, the cow, and preparing the meals—all busy, all earning money, and self-supporting."

The Army only had to start this family with a cottage, a team, agricultural implements and seed.

The mistake of undertaking to create a strictly farming population has not been made. A better plan was learned from recent efforts to colonize Jews. All the colonies failed until the trades were taken as well as farm laborers—that is, until a complete community was founded, where all sorts of enterprises were carried on together. Some of the colonists at Fort Amity and elsewhere are carpenters, masons and teamsters. All of these find abundant employment, and at the same time are creating for themselves landed homes, with cottages and barns. Most of the colonists have more or less household goods. These are shipped for them, and the settlement is made upon plots of from ten to twenty acres each—each plot having a house and agricultural tools. Horses, cows, pigs and poultry are furnished for a beginner. This creates a debt against the colony. In return he is set at work upon irrigating ditches, fences, etc., at $2 a day, half of this being credited on his debt and the other half going to his living expenses, until his land begins to bring an income. At Fort Amity every colonist had discharged his entire debt early in 1902—that is, inside of four years. The result is that each family is at present living in a neat stone cottage, with at least twenty acres of land, without debt and with social surroundings of a stimulating sort. Land values are, of course, going up, and at Fort Amity are double what they were in 1898.

Considering the general experience of colonizing efforts, it is natural that the Salvation Army should be pressed with such questions as these: What do you think will be the outcome of any general effort along these lines? Have we to select our colonists very carefully, or are we on the road of a very general movement? Are the colonists willing to meet their liabilities? The answer to the first question is given by General Booth that no success in colonizing may be looked for unless on a large scale—sufficiently large to make the settlement interesting and lively—not a mere hamlet or group of houses. There must be no effort at conformity of political or religious views. The work must be sufficiently large to carry the incidental supervising expenses, and there must be on hand experienced and devoted men and women to supervise it. To another question the reply is that colonists are not only willing but eager to pay off their debts and make the colony a success. But were this not so, the rise in land values would afford protection against loss. "Experience shows few outlets for capital so free from risk as colonization schemes honestly and sensibly managed." This statement is made after an experience with severe drought, insect pests, interest paid on borrowed capital, and considerable difficulty in securing a market.

Farm colonies under the supervision of the Salvation Army have been created in South Africa and Australia, as well as in England. It has been found advisable in all the English colonies to make large grants of land and annual grants of money to aid these efforts. In Rhodesia three thousand acres have been turned over to the Army, and Western Australia has set apart twenty thousand acres. Charles Roper reports that, after a thorough examination of the working of these colonies, he is convinced that modern society has hit upon "a great discovery in the way of eliminating the poorest classes." Some time ago the sug-

gestion was made that our own Government should take up colonization in connection with its scheme for extensive irrigation. If it be worth while to spend two millions in placing water on a tract of arid land, why not spend twice that sum profitably in placing colonies upon the land? A more formal effort is now before Congress, in the form of a bill to create a Colonization Bureau, under the direction of a Commissioner of Colonization, in connection with the Department of the Interior. It is provided that poor families may have from $500 to $1,500 in cash, or materials, advanced to them by the Government, to enable them to create homes. In addition forty acres of irrigated and eighty acres of non-irrigated land may be assigned to any *bona-fide,* worthy family. The subject is certainly one of the most important recently taken up by political economists.

Senator Burton

It was "a just and true verdict," said Judge Adams in sentencing United States Senator Burton, of Kansas, to prison for six months. Further, it was a healthy verdict. It is a warning to other legislators that they must not sell their services in promoting legislation for money. Then, by parity of reason, if not of enactment, they must not sell their services for any other personal favor, as for assistance in re-election. They must not help on questionable bills for pensions or local appropriations, or questionable appointments to office, with the view of securing a return to a five thousand dollar legislative job for two or six years. The principle is the same, even if the law is not as explicit. It was a terrible scandal when the Star Route frauds were exposed, or earlier, when Oakes Ames, of Massachusetts, and James Brooks, of New York, were called before the bar of the House for censure of their conduct in the Credit Mobilier affair. This conviction of Senator Burton may now make some others tremble, and persuade some other thrifty legislators to keep just within the letter of the law.

Professor Bowne's Acquittal

We do not question that the Rev. George A. Cooke thought, or thought he thought, he was doing God service when he brought charges of heresy against Prof. Borden P. Bowne. We also presume that Mr. Cooke was egged on to his attack by older men, possibly a bishop or two, whose conscience retains its stubbornness while losing its intelligence. They are men who do not know that the world moves, and that theology also learns something with the years. We are by no means sure that Professor Bowne is orthodox after the full pattern of the Wesleys. Possibly in the early days of Methodism he would have been condemned and silenced; but it indicates both the strength of the current and the essential soundness of the new theology that Dr. Buckley should have been Professor Bowne's enthusiastic advocate before the New York East Conference. We give our heartiest congratulations first to the Conference and to the Methodist Church, which it represents, that it has almost unanimously refused to sustain the assault against reasonable Christian faith; and next to Professor Bowne, who represents the scholarship and intelligence of his Church, and whom we are happy to remember as having been for a number of years before he went to the Boston University a valued member of the editorial staff of THE INDEPENDENT.

Berea College

Somewhat, we imagine, to the surprise of the President and trustees of Berea College, they found courage at their meeting the other day to resolve to contest the constitutionality of the act just passed by the legislature of Kentucky forbidding the instruction in that college to be carried on as it has been from a period before the Civil War. The college was started for the definite purpose of educating any youth that would come, of whatever sex or color, and the experiment was a success. The white youth, in their eagerness for education, came from their mountain homes, and learned that they were not contaminated by sitting in classrooms with those of a darker skin. Considerable money was given to the college definitely pledged to colored education. But the late policy of the college has been to seek white patronage, while not particularly encouraging colored applicants. It has been freely declared, and as roundly denied, that President Frost's inner desire was to make it a white college and

send the colored students elsewhere. Meanwhile the wave of growing virulence excited by the progressive elevation of the late slave race reached Kentucky and led to the enactment of this law forbidding co-education of colors in any institution, or their education within forty miles of each other by any such institution. The record of the officers of Berea in opposing this act is correct, but it was charged that they were not much disappointed or grieved at their failure, and they certainly began planning how to accommodate themselves to the sentiment which they had for fifty years been opposing. But the protests of some of the trustees have persuaded President Frost and the board that it is best to fight the law in the courts. Its constitutionality is most doubtful, and a similar law was overturned by the Florida courts. Whether or not it may come within the reserved power of a State to annul the long exercised rights of an incorporated institution, it is plain that it is a moral outrage to forbid youth any longer to attend a school to which they have been freely admitted for half a century.

President Roosevelt to the Publishers

The purpose of the Periodical Publishers' Association of America is acquaintance and fellowship and mutual aid in matters of common concern. Their first dinner in Washington was an occasion notable for the presence of the best known author in the United States, and one of the most prolific, Mr. Theodore Roosevelt, and for an address by him. He deprecated every utterance in the press of discourtesy toward other nations, anything that would produce irritation or would be resented if spoken of us. Naturally the responsibilities of his office compel Mr. Roosevelt to observe the evil of national boastfulness or truculence. It is interesting to observe the ethical direction to which the President's speeches tend. It is a happy thing for the country that he preaches honesty, fairness, justice, courage and self-restraint, as well as practices these virtues. In this address he dwelt on the principle, so familiar in biblical teaching, that "a man whose morality is expressed merely in the non-infringement of law is a pretty poor creature." That rule of willing extra-legal service is what has sometimes been called the second-mile morality, referring to our Lord's command that if an officer impresses one to go with him a mile, he should go with him twain, adding something of good will to what is strictly required. A good citizen is one who gives more service to the State than the law demands, and does not take in business every possible legal advantage.

A new and quite interesting point in the interpretation of the Civil Code of Hammurabi, that code which is a thousand years older than Moses and the earliest of all known documents in the history of legislation, was brought out by Prof. D. G. Lyon, of Harvard, at the meeting of the American Oriental Society last week. Three words in the introduction to the Code, "*ina pi matim,*" he translates "in the language of the country," instead of simply "in the land," as other commentators have given it. That is, Hammurabi declares that he promulgated his Code in the vernacular, the common language of the people, and not in the old Sumerian, the language of the scholars. Doubtless the laws had existed in the old language, but the King claims credit for having compiled and published them in a language anybody could understand. And it is notable that the words are spelled out, in the easiest way, without contractions. Hammurabi did not believe in "Law Latin." He wanted all knowledge brought to the common people.

The report of the Committee on Territories, admitting Oklahoma and the Indian Territory as one State, and New Mexico and Arizona as a second, deserves general approval. It is time they became States, but we do not want four small States after the pattern of Nevada and Wyoming.

We are glad that Secretary Moody has thought it worth while to reply to the mischievous falsehoods which represent the "Mayflower" as the "President's yacht." She has never been diverted from her duties for his use, and he has never traveled in her but 94 miles, and on Government business.

Insurance

The New President of the Home Insurance Company

ELBRIDGE GERRY SNOW, Vice-President, was last week elected President of the Home Insurance Company in place of John H. Washburn, who declined a re-election. Mr. Snow was born at Barkhampsted, Connecticut, in 1841. He first studied law, but soon turned his attention to insurance. In 1862 he became a clerk in the main office of the Home Insurance Company, where he remained for nine years. In 1871-2 he was interested in an insurance agency of his own, and afterward returned to the Home Insurance Company and became State agent for Massachusetts, with headquarters at Boston, where he also formed a partnership under the firm name of Hollis & Snow, for doing insurance business. In 1885 he was elected Secretary of the Home Insurance Company and returned to New York. In 1888 Mr. Snow was made Vice-President and held that position until his election as President last week. The two Vice-Presidents are Emanuel H. A. Correa and Frederic C. Buswell. Mr. Correa was born in the West Indies, educated in Europe and came to New York in 1872. Just after the Chicago fire he took a position with the National Board of Fire Underwriters, where he remained until 1879. He then entered the service of the Home, and became Assistant Secretary in 1898 and Vice-President in 1902. The two Secretaries are Areunah M. Burtis and William H. Cheney, and Assistant Secretaries, Henry J. Ferris and Clarence A. Ludlum. Just a year ago the Home Insurance Company celebrated its semi-centennial. Besides Mr. Washburn and Mr. Snow its Presidents have been Simeon L. Loomis, Charles J. Martin and Daniel A. Heald. The Directors of the Home are: Levi P. Morton, Cornelius N. Bliss, John H. Washburn, Benjamin Perkins, Elbridge G. Snow, George H. Hartford, Henry F. Noyes, Lucien C. Warner, Dumont Clarke, James B. Van Woert, John Claflin, Cord Meyer, Levi C. Weir, John H. Flagler and Emanuel H. A. Correa. Levi P. Morton, ex-Vice-President of the United States, is the sole survivor of the original Board of Directors. The assets of the company are over eighteen million dollars, the net surplus over six and one-half million dollars, and the surplus as regards policyholders over nine and one-half million dollars.

Progress of the Travelers Insurance Co.

The Travelers Insurance Company, of Hartford, celebrated its fortieth birthday on April 5th. It began business in 1864, basing its methods upon those of an English pioneer, one of whose tickets for £1,000 in favor of the founder and first president of the Travelers, James G. Batterson, is still preserved as a highly prized relic of the company. The first premium received by the Travelers was two cents, for which the company insured the life of one James Bolter while journeying from the Hartford Post Office to his home in the same city. From such a beginning the Travelers has grown step by step until now, after forty years of

Financial

Steel Corporation's Earnings

SOME had predicted that the Directors of the Steel Corporation, at their meeting last week, would reduce the dividend on the preferred stock. But the regular quarterly dividend of 1¾ per cent. was declared, altho a statement published at the same time shows that net earnings of the quarter ending on March 31st were not sufficient to meet this payment and the fixed charges. For the quarter the deficit was $1,857,120. Owing to the improved prospects for business, however, the Directors were warranted in drawing upon the surplus for that sum. It is true that the net earnings for the quarter were the smallest on record, having been only $13,208,886, against $25,068,000 in the corresponding quarter of last year, and $26,715,000 in 1902. Up to this time, the lowest quarterly net return had been $15,037,000, in the quarter ending with December last. The quarterly decline is shown as follows:

Quarters.	Net earnings.
Ending June 30th, 1903	$36,642,308
Ending September 30th, 1903	32,422,955
Ending December 31st, 1903	15,037,182
Ending March 31st, 1904	13,208,886

These are not encouraging figures. But those which show recent monthly net earnings are of a more promising character, indicating a turn for the better:

Month.	Net earnings.
July, 1903	$12,384,647
August	10,918,174
September	9,120,134
October	7,675,141
November	4,069,901
December	3,292,140
January, 1904	2,868,213
February	4,540,673
March (estimated)	5,800,000

Here are plain signs of a turn of the tide, and with them should be considered the official report that the great company's unfilled orders on hand have been increased from only 3,215,123 tons on December 31st to 4,136,961 tons on March 31st. The Corporation is getting its share of the benefits due to the recent quite perceptible improvement in the iron and steel industry.

THE bank exchanges of the United States in March were the smallest for that month in four years, being 12½ per cent. below those of March, 1903. In New York the reduction was 20 per cent.; outside of New York there was a very slight increase over the clearings of last year.

....John C. McKeon and John C. Van Cleaf were last week elected Vice-Presidents of the National Park Bank of New York. Mr. McKeon was born in Illinois in 1858; and in 1882, while in charge of the tax books at the County Clerk's office at Ottawa, Ill., he met James H. Eckels, whose warm friend he became. As Comptroller of the Currency, Mr. Eckels in 1893 appointed Mr. McKeon National Bank Examiner for Chicago, and in 1896 he appointed him Receiver of the National Bank of Illinois. When the Commercial National Bank of Chicago was reorganized in 1898, Mr. Eckels, who became President, invited Mr. McKeon to be the first Vice-President, in which capacity he had charge of the loans. Mr. Van Cleaf, the other new Vice-President of the Park Bank, was born and educated in New York, and after an experience in the credit department of a commercial house, he entered the credit department of the Park Bank seven years ago, and in 1902 became Assistant Cashier. With a capital and surplus of ten millions, and deposits of more than eighty millions, the Park Bank, of which Richard Delafield is President, has long been known as the great commercial bank of New York.

(*Continued from page* 871.)

life, it is the largest accident company in the world. Much of the first success of the company was due to the untiring energy of the late President James G. Batterson. The present president of the Travelers' Insurance Company is Sylvester C. Dunham, who cast in his fortunes with the Travelers in 1885. Mr. Dunham was orginally the counsel of the company, later its vice-president, and on October 14th, 1901, following the death of Mr. Batterson, was elected president. The first vice-president and right hand man of the executive officer is John B. Lunger, who has shown himself a great force in building up the Travelers Insurance Company.

Vol. LVI NEW YORK, THURSDAY, APRIL 21, 1904 No. 2890

Survey of the World

Mr. Carnegie's Hero Fund

It became known at the end of last week that before his recent departure for Europe Mr. Andrew Carnegie transferred to a commission $5,000,000 in Steel Corporation bonds, and thus created a fund for the benefit of "the dependents of those losing their lives in heroic effort to save their fellow men, or for the heroes themselves if injured only." This project was conceived by Mr. Carnegie immediately after the disaster in the Harwick coal mine (where nearly 190 men lost their lives), and was suggested in part by the heroism at that time of Selwyn M. Taylor, a prominent mining engineer, who was killed while leading the rescue party, and of a miner named Lyle, who met a similar fate while striving to save his imprisoned associates. This $5,000,000 is to be known as The Hero Fund. The commission is composed of twenty-one residents of Pittsburg and vicinity, its President (Charles L. Taylor) and its Secretary (F. M. Wilmot) holding similar offices in connection with the Relief Fund established by Mr. Carnegie for the benefit of persons employed in his steel works. In a long letter to the commission, setting forth his purpose and directing in what manner the fund should be used, Mr. Carnegie said:

"First.—To place those following peaceful vocations, who have been injured in heroic effort to save life, in somewhat better positions pecuniarily than before, until again able to work. In case of death, the widow and children or other dependents to be provided for until she remarries, and the children until they reach a self-supporting age. For exceptional children, exceptional grants may be made for exceptional education. Grants of sums of money may also be made to heroes or heroines as the commission thinks advisable, each case to be judged on its merits.

"Second.—No grant is to be continued unless it be soberly and properly used, and the recipients remain respectable, well-behaved members of the community; but the heroes and heroines are to be given a fair trial, no matter what their antecedents. Heroes deserve pardon and a fresh start.

"Third.—A medal shall be given to the hero or widow or next of kin, which shall recite the heroic deed it commemorates, that descendants may know and be proud of their descent. The medal shall be given for the heroic act, even if the doer be uninjured, and also a sum of money, should the commission deem such gift desirable."

The commission is directed to guard most carefully against interfering with municipal pensions for policemen and firemen or municipal rewards for heroism. In such cases the medal can be offered, and something more may judiciously be done with the approval of the city authorities. Out of the surplus grants may be made in case of such an accident as that at the Harwick mine, but in such a way as to stimulate the generosity of the community. By a two-thirds vote, parts of the surplus may be given to those suffering from want by reason of no fault of their own:

"The field that will be embraced by the fund is Canada and the United States and the waters thereof. The sea is the scene of many heroic acts. No action is more heroic than that of doctors and nurses volunteering their services in epidemics. Railroad employees are remarkable for heroism. All these and similar cases are embraced. Whenever heroism is displayed by man or woman in saving human life the fund applies."

Every year a full report of the commission's awards must be published in at least one newspaper in each of the cities of Pittsburg, Washington, New York, Ottawa, Montreal, Winnipeg, Chicago, St. Louis, New Orleans, St. Paul, Jacksonville, San Francisco and Denver.

Political Conventions and Platforms

Immediately after the New York Republican convention, Governor Odell was elected chairman of the party's State Committee. It is understood that he does not intend to give up his other office. This change and the general course of the convention marked the transfer of power in party management from Senator Platt to the Governor. The platform spoke of the Senator's "splendid services" and "inspiring and potent leadership." It "directs" the delegates at large to use all honorable means to bring about Mr. Roosevelt's nomination. To "direct," it has been explained, was regarded as more forcible and imperative than to "instruct." The President was very warmly commended in the platform, and the acts of his administration were heartily approved. In a brief paragraph "the principle of a protective tariff" is supported. The "protection and permanency of all civil and political rights of our citizens, without discrimination as to race or color," is demanded; and the platform calls for protective legislation that shall give to American-built ships the larger part of the carrying trade in our foreign commerce. There was no reference to Trusts or to the President's enforcement of the Anti-Trust law, except in the sentence:

"We commend Theodore Roosevelt for the fearlessness and good judgment with which he entered upon the solution of problems of social economy and government."

But the subject was not neglected in the address of the permanent chairman, Congressman Payne (chairman of the House Ways and Means Committee), who, after commending the President's intervention in the coal strike, said that he had fearlessly enforced the Anti-Trust law:

"His party's position against Trusts and combinations that restrain trade and fair competition has been no secret. It has always proclaimed that it makes no war on honest corporations formed for an honest purpose, for legitimate business, employing labor, building up industry and promoting trade and commerce. It is a relentless foe to all combinations that rob the people. Now that the law is upheld, our opponents clamor for the commencement of a general crusade for the ruin of all corporations, good, bad and indifferent. The Republican party is an enemy to unlawful enterprises only. It will not commence an indiscriminate slaughter against those which promote prosperity and provide wages for the workers by lawful methods. The administration will proceed with careful investigation. It will indulge in no gallery play. Those engaged in lawful business have no cause for alarm. Unlawful combinations only will be attacked. In a word, the law will be impartially enforced."

In the Massachusetts Republican convention, the only contest was upon the question of reciprocity with Canada, raised by Eugene N. Foss, whose resolution in favor of such reciprocity was rejected by a great majority, after a speech by Senator Lodge, who declared that the resolution was a reflection upon the Republican Administration and virtually asserted that Mr. Foss was a Democrat. The latter, as a candidate for delegate-at-large, received 178 votes out of 1,309. The platform supports protection, saying that tariff schedules are neither sacred nor immutable, but that revision can be safely intrusted only to the party of protection. Reciprocity with Canada, it asserts, is a mere phrase until the concessions offered or demanded are stated in detail. The acts of the President, including enforcement of the Anti-Trust law, are approved, and it is asserted that the Federal Government should prevent discrimination at the ballot box against any one on account of race, creed or color.—A large part of the platform adopted last week by the Democrats of New Jersey is denunciation of Trusts and of tariff duties which give them "unfair advantages." The President is attacked for his action relating to Panama and for his alleged encroachments upon the province of Congress. Judge Parker is said to be the choice of the delegates. A small minority of Hearst men bolted. In a separate meeting they adopted resolutions declaring

that the convention represented Trusts and railroads, and that the delegates at large were agents of the Republican party.

The Talk of Politics

Some think that Mr. Bryan would bolt if Judge Parker should be nominated. In an article opposing the Judge's candidacy Mr. Bryan says:

"If the party is to return to its wallow in the mire of plutocracy, it might just as well openly declare its purpose and renominate Mr. Cleveland. Parker, alias Belmont, could not be substantially different from Cleveland, alias Morgan, and either would mean that organized wealth would continue to plunder the people as mercilessly as it does now."

The Secretary of the Democratic National Committee, C. A. Walsh (of Iowa), publishes a long statement hostile to Judge Parker, saying that the latter's supporters desire to "put the machinery of the Democratic party again in the hands of the corporations and of those who amass gigantic fortunes through special privileges in legislation and departmental favoritism."—Congressman Bourke Cockran, of New York, who represents a Tammany district, remarked in the House last week that Mr. Cleveland was a man "whose friendship means destruction, whose touch means paralysis, and whose support means dishonor." Mr. Cleveland's attitude toward the negroes continues to be a subject of desultory discussion in the House. On the 12th inst. Mr. Bartlett, of Georgia, read a letter received by him, in which Mr. Cleveland speaks as follows of assertions made by Thomas E. Watson concerning the presence of Frederick Douglass at his wedding reception, and a bill for mixed schools in New York:

"I cannot afford to devote a great deal of time in denying such foolish tales. I shall, therefore, attempt to cover every phase of the subject now and for all. It so happens that I have never in my official position, either when sleeping or waking, alive or dead, on my head or on my heels, dined, lunched, or supped, or invited to a wedding reception any colored man, woman, or child. If, however, I had decided to do any of these things, neither the fear of Mr. Watson nor any one else would have prevented me.

"When I was Governor a movement was made in the Legislature to abolish separate colored schools in New York City. I opposed the measure and it failed. I do not find that I interposed a veto, and have forgotten the course the matter took; but I know that whatever I did was in favor of maintaining separate colored schools instead of having them mixed."

Mr. Scott, of Kansas, showed, however, that the bill abolishing separate colored schools did not fail, but became a law on May 5th, 1884, while Mr. Cleveland was Governor, and with his official approval.

Washington Topics

The Supreme Court, Chief Justice Fuller and Justice Harlan dissenting, has upheld the order of July 17th, 1901, by which Postmaster-General Smith excluded the so-called serial "libraries" from mails of the second class. Each issue in these "libraries" was a complete book, and they had been carried at the rate for magazines and other periodicals, or one cent a pound. The actual cost of carriage was not less than 5 cents. The Department had repeatedly asked for legislation that would definitely place these publications in the class for which the rate is 8 cents a pound. Mr. Smith decided to place them there by executive order or ruling. Several publishers protested and brought suit. After expressing the opinion that the order was a reasonable one, the court declines to interfere with the discretion vested in the Postmaster-General. Justice Harlan argues that Congress, having repeatedly withheld the suggested legislation, intended that these publications should be carried at the lower rate. He finds the ruling objectionable because it made or amended the law by executive order. It is estimated that in the year preceding the order 200,000,000 pounds of the publications affected by it were carried at the one-cent rate.—In the Senate Mr. McComas introduced a bill extending the coastwise navigation laws to the Panama Canal zone. This excited opposition on the ground that in the zone the United States has neither sovereignty nor ports. The pending bill for the government of the zone was passed, Mr. Hale withdrawing an amendment requiring that men and supplies for the canal be carried only in United States ships.—For some time the Democrats have been demanding a thorough investigation of the Post Office Department by a special committee of

Congress, asserting that the Republicans were withholding their consent because they feared the disclosures of fraud that would attend such an inquiry. Republicans replied that the demand was made for political purposes, and that any specific charge would be promptly investigated, altho no inquiry in addition to the Bristow investigation was needed. In the Senate last week Mr. Lodge said: "In our own time and in our own way, when we think it proper to do so, we shall provide for an investigation." It is now expected that the Republican leaders will authorize a sub-committee of the Post Office Committee to sit during the recess and inquire as to any specific charges that may be made. All members of the House whose names were in the recent report concerning additional allowances to postmasters and the renting of post offices have been exonerated by the report of the special committee of inquiry.—The special committee appointed in the Senate to investigate the charges against Senator Dietrich has reported that he was not guilty of corrupt conduct or of violating the law. Upon these charges he was indicted in Nebraska.—In the House the Foreign Affairs Committee has introduced a bill (prepared by Attorney-General Knox) to cure such defects in the Chinese Exclusion law as may be due to the approaching expiration of the treaty with China.—It has been decided by the House Republican caucus that an attempt to pass the bill for two new States shall be made at this session. Concurrent action in the Senate will probably be deferred until next winter.—At the request of Senator Tillman, action upon the nomination of Dr. Crum, the negro who was appointed to be Collector at Charleston, has been postponed until December.

Shocking Accident on a Battleship

By an accident on the new battleship "Missouri" 32 men were killed (29 of them instantly) on the 13th inst., while the gunners were engaged in target practice about ten miles from Pensacola. One of the twelve-inch guns in the after turret had been discharged three times. In preparation for a fourth shot the shell and two bags of smokeless powder had been inserted; the third bag was near at hand, and the breech was open. In some way the powder in position was ignited, the turret was filled with flame, and all of the 25 persons in it were instantly killed. Another charge of powder was coming up the hoist, and two charges (360 pounds each) were ready in the handling room below, adjoining the magazine. All these were ignited, and only three persons in the handling room escaped with their lives. The ship was saved by the heroism of two or three enlisted men, one of whom, named Monson, hastily entered the magazine, closing the door as he went, and was nearly drowned there by the prompt flooding of the compartment. Another, named Knight, received fatal injuries while protecting the magazine. The ship was headed for the beach, because it was feared that she might sink, but her course was changed by Captain Cowles just in time to prevent her from grounding. Among the killed were five officers—Lieut. W. C. Davidson, Lieut. J. P. V. Gridley (son of the late Captain Gridley, who commanded Dewey's flagship at Manila); Lieut. Thomas Ward, Jr.; Ensign E. A. Weichert, and Midshipman W. E. T. Neumann, son of the late Paul Neumann, who was King Kalakau's legal adviser. Ward and Neumann were classmates and intimate friends. Neumann was soon to marry Ward's sister. Both will be buried in the old Naval Cemetery at Annapolis. The cause of the accident may never be surely known, for all who were in the turret were killed at once. Probably, however, a fragment of the canvas bagging that had inclosed the preceding charge of smokeless powder was burning in the breech when the powder that exploded was introduced. In striving to make a record for rapid firing of the big guns, in competition for a trophy offered by the Navy Department, the limit of safety appears to have been passed. The "Alabama" has a record of only 38 seconds between shots; the "Wisconsin's" gunners surpassed this by ten shots in 340 seconds. In such work the breech must be opened immediately after a discharge, and another charge of powder must be inserted at once. Other charges must be near at hand, as they were in this instance. Two days after this accident the "Texas" made a new record with a twelve-inch gun—11 hits out of 12 shots in 10 minutes; but it is reported that her

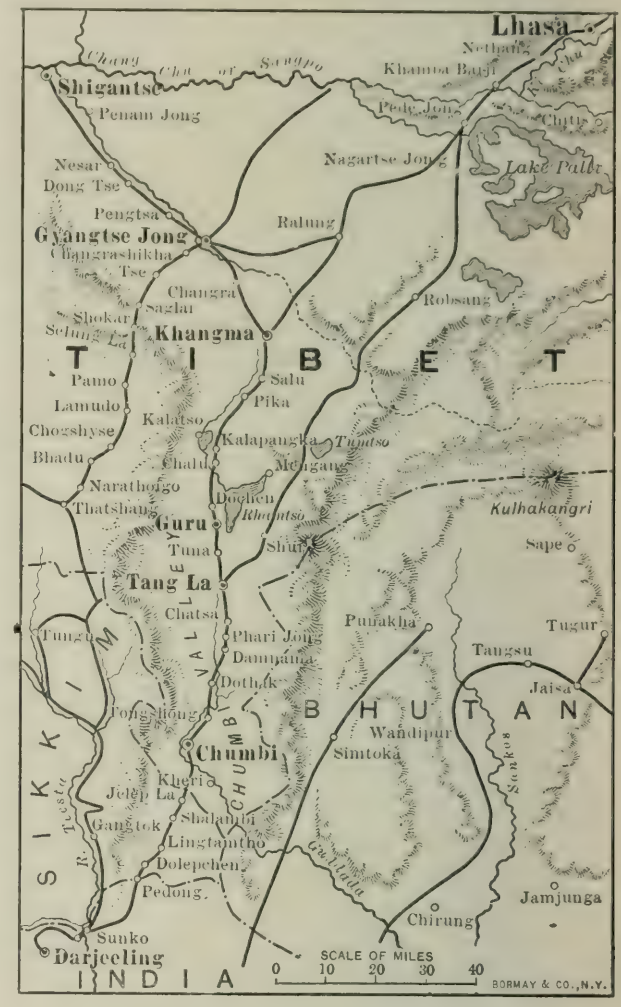
gunners narrowly escaped the fate of those who were killed on the "Missouri."

The Philippines and Other Islands

In Mindanao, the Moros of the Lake Lanao district are again on the war-path. Having declined to meet General Wood for a friendly conference, the Sultan of Taraca and his followers fired upon a marching column of American troops and were punished by the destruction of all their forts. Two American soldiers were killed. A few days later, on the 11th inst., while approaching the Moro camp, Capt. David P. Wheeler (West Point, '98, of Ohio) and Corporal Heyvelt were stabbed by their Moro guides, receiving mortal injuries. Captain Wheeler's death has been announced.—The Frye bill, as finally passed by Congress, postpones until July 1st, 1906, the application of our coastwise navigation laws to trade between the Philippines and the States. By a party vote the House has passed a bill authorizing the Philippine Government to borrow $5,000,000 for public improvements, and to guarantee the income, up to 5 per cent. of the actual cash capital, of money invested in new railway projects. But the annual liability must not exceed $1,500,000. Municipalities are authorized to borrow, for sanitary and other local improvements, amounts not exceeding 5 per cent. of their assessed valuation.—The contesting factions of the Cuban House of Representatives have at last permitted a quorum to assemble. Contests arising out of the recent election are to be referred to a committee.—The recent report of the Board of Health of Porto Rico shows a death rate of nearly 27 per thousand. Of 25,552 deaths reported in the year, 9,485 (or 37 per cent.) were those of children under five years of age. A great many of these deaths were due to infantile tetanus, a disease caused by unsanitary customs and entirely preventible. There were also 6,708 deaths due to anæmia, due in part to the extreme poverty of the people. "Chronic semi-starvation," says the Board, "is the ordinary condition of the poor in Porto Rico, and in their case the slightest cause of malnutrition may be sufficient to turn the scale against them in the struggle for existence."

Attempted Assassination of Maura

King Alfonso has denied that there was any attempt to assassinate him during his visit to Barcelona, altho a detailed report of the throwing of a bomb while he was passing through the streets was sent all over the world, and he was the recipient of numerous telegrams congratulating him on his narrow escape; but his Prime Minister was not allowed to leave "the hotbed of anarchy" without receiving a token of his unpopularity. At half-past twelve o'clock on April 12th, as Señor Maura was returning from the funeral services in the cathedral for the late Queen Isabella, he was attacked by a young man, who leaped upon the carriage step and attempted to stab him in the heart; but the weapon, which was made from a common kitchen knife, was caught by the heavy gold lace on the Minister's coat and only a slight wound was inflicted. The name of the would-be assassin is Joaquin Miguel Artao. He was at once seized by the police, altho he attempted suicide by dashing his head against a wall, and an accomplice, Matios Ortel, has since been arrested. Both are anarchists and members of a secret society called the "Lovers of Liberty." Artao was employed as a domestic. A year ago Señor Maura was attacked in Madrid while riding in a carriage with Señor Silvela, by a mob of students who were infuriated at his energetic suppression of the student riots at Salamanca. Eight policemen and a number of students were wounded in the Madrid riot.



King Peter and the Assassins

The assassination of King Alexander and Queen Draga, June 11th, 1903, resulted in the boycott of Servia by the Powers. Russia, Austria, England and other nations refused to recognize Peter I so long as he tacitly approved of the crime, which gave him his throne, by keeping at his court the leaders in the regicide. Most of the embassies have been withdrawn or allowed to lapse. It was expected that as soon as he felt himself secure the new King would punish the conspirators, and so re-establish cordial relations with the Powers. This expectation seemed to have been fulfilled when, on April 1st, it

was announced from Belgrade that all the regicide officers had been removed from their posts. Further explanation of this action very materially modifies the general approval with which it was at first received, for it appears that the criminals were mostly punished by promotion, and that while they are banished from court, they are still in positions where they can make their power felt Colonel Machin is made chief of an important military department in control of the national defense. Damian Popovitch is put in charge of army division of the Danube. Lieutenant-Colonel Mitschitch is the only one of the leaders who is dismissed from the army, and this is at his own request. On the other hand, it is reported that four superior officers who publicly opposed the conspirators have been discharged with him. The revolution has resulted in no practical benefit to Servia. The finances are in as bad a state as under Alexander. Life and property are no more safe, and the press is stringently muzzled. General Grouitch, President of the Council of State, is a feeble man, and his two sons were among the conspirators. Stojan Protitch, Minister of the Interior, is a man of more energy, but also connected with the regicide. In the Skupshtina the "Young Radicals," numbering 62, approved of the assassination; the "Old Radicals" accepted it. Both branches of the Radical party are what would be called very conservative elsewhere. Besides there there are 15 "Liberals" and one "Progressionist" to make up the number of 150 delegates.

The British in Tibet

Whatever we may think of the ethics and politics of the British invasion of Tibet, we can appreciate the benefit derived from it in the extension of our knowledge of the geography of this mysterious region. The map we publish this week gives in detail the route of the British from Darjiling to Gyangtse, where at present the mission is halted to await negotiations before advancing toward Lhasa. Their disastrous attempt to check the British at the Hot Springs near Guru does not seem to have discouraged the Tibetans from further opposition of the same ineffectual sort. At the village of Samonda, near Kalapang, a band of two hundred Tibetans was encountered, who offered to parley and then treacherously opened fire on the British officers who came forward for that purpose. The Tibetan matchlocks and Martinis manufactured in Lhasa appear to be more dangerous to the users than to their opponents. None of the British were hit but in the resulting fight a number of the Tibetans were wounded

Map of the British March into Tibet

and seventy made prisoners. The treatment of the wounded and prisoners taken at Guru is reported to have made friends of them. The wounded come voluntarily to the medical officers for treatment, and some of the released prisoners refuse to go home and wish to join the British force. The inhabitants of the Chumbi Valley continue friendly and apparently rejoice in the defeat of the soldiers from Lhasa. At Guru was found an arsenal and storehouses containing clothing and grain. Evidently a determined effort to resist the invaders had been planned, for

it is estimated that there were 2,000 men behind the defenses on the road, with a reserve of 1,600 in Guru, and a force of 2,000 stationed behind fortifications on the other side of Lake Rham, in the expectation that the British might take the direct route to Lhasa. The new Amban, the Chinese representative at Lhasa, writes to Colonel Younghusband that he wishes to meet him, but that the Dalai Lama refuses to give him transportation and a guard. It is expected that both the Amban and the Tibetan authorities will go to Gyangtse for conference with the British mission. Dorjieff, who is considered by the English as a Russian envoy, has been given one of the highest positions in the Tibetan Government, that of Dzasak, or Master of Ordnance and Treasurer to the Dalai Lama. In the House of Commons Mr. Brodrick, Secretary of State for India, stated positively that the British mission into Tibet was undertaken with the previous knowledge and consent of China, the sovereign power. The expense of the expedition has been so far about $100,000 a month.

German Southwest Africa

The rising in the German colony in Danaraland is by no means quelled. On the contrary, both columns of the expedition have had to do some very hard fighting against native forces, sometimes outnumbering them ten to one, and have lost heavily both in officers and men. The small forces dispatched to South Africa are now perceived to be altogether inadequate. The Emperor, when the outbreak was first reported, favored sending at once six thousand men under the command of a general, but he was overruled by the colonial and military authorities. If this policy of energetic action had been followed in the beginning, it is probable that the natives would have been overpowered and discouraged, but the present predatory warfare may be continued by them indefinitely. The chief force of the Hereros, numbering 3,000, was encountered at Onganjira, a short distance to the east of Okahandja, where they occupied a strong position on a hill fronting the northwest. The Governor of the colony, Colonel Leutwein, was in command with both Duerr's and Estorff's divisions. After eight hours' fighting the position was forced and the natives retired toward the northwest. This would take them in the direction of Glasenapp's column of only 350 men, and as these have not been heard from since, it is feared that they have been overpowered. On April 13th the Hereros took the offensive, attacking Colonel Leutwein's column near Oviumbo. After ten hours' fighting they were repulsed with great loss. On account of the number of officers and men wounded, the Germans also found it necessary to retreat, and fell back to Otjosasu.

The "Petropavlovsk" Destroyed

Admiral Togo has made his eighth attack on Port Arthur, on April 13th, and altho he begins his report with his customary phrase, "as previously planned," the result must have exceeded his greatest expectations, for the flagship of Admiral Makaroff was blown up and one Russian destroyer sunk. It was one of the most skillfully devised stratagems in naval warfare. At midnight two destroyer flotillas and a torpedo flotilla, accompanied by a merchant vessel, succeeded in spite of the Russian searchlights in laying a number of mines just outside the entrance to the harbor. Several of the Russian torpedo boats were outside the harbor and on their return in the morning they were attacked by the Japanese, and one of them, the "Strashni," was sunk after a desperate fight against the four torpedo boats which surrounded her. The other Russian vessels escaped into the harbor through the aid of the "Bayan," which made a brave sortie against the Japanese fleet. The plan of the Japanese was to entice out the Russian fleet, lead them over the hidden mines, and then cut off their retreat by interposing an ambushed fleet. As bait four unarmored cruisers, the "Chitose," "Yoshino," "Kasagi" and "Takasago," under Rear-Admiral Dewa, approached the port and retreated as the Russian fleet emerged. This consisted of the battleships "Petropavlovsk," "Peresviet," "Poltava," "Pobieda" and "Sevastopol," the cruisers "Novik," "Diana' and "Askold," and the torpedo boats. When

the Russian fleet had been drawn about fifteen miles from the port, Admiral Dewa signaled by wireless telegraphy to Admiral Togo to attack them in the rear. The fleet under Admiral Togo was stationed thirty miles out and was composed of the swiftest Japanese vessels, the "Hatsuse," "Mikasa," "Asahi," "Shikishima," "Yashima" and "Fuji." As soon as these were sighted the Russians retired toward the harbor, and the "Petropavlovsk" passed over one of the hidden mines and was instantly destroyed. The first explosion seemed to lift the gigantic vessel out of the water; it was followed by two others, perhaps from magazines or boilers; the ship turned completely over, thus imprisoning the seven hundred men on board, and drowning such as had not been already killed. Great admiration and regret for Admiral Makaroff, who was killed on the bridge by the first explosion, are expressed in all countries, including Japan. A still greater loss was inflicted on the whole world by the death of Vassili Verestchagin, the Russian artist, who was Admiral Makaroff's guest on board the "Petropavlovsk." He was born in 1842, studied under Gérome, and devoted his life to painting the horrors of war for the purpose of promoting peace. His military pictures cover the Russo-Turkish war, the Napoleonic campaign against Russia, the Sepoy rebellion, the Philippine and Cuban wars and the Boxer insurrection. All of his work was done from careful sketches on the battlefields, and he has been through many campaigns. Americans are quite familiar with his work from the visits he paid here in 1887 and 1902. He was proposed as a candidate for the Nobel prize, awarded to the man who has done most for the promotion of peace.—The Grand Duke Cyril was on the bridge of the "Petropavlovsk," but escaped, tho with some serious wounds. The staff of Admiral Makaroff, numbering fifteen or sixteen, were all killed. Of the men 52 are reported saved out of the total of about 700. Vice-Admiral Skrydloff, now at Sevastopol, has been appointed to succeed Admiral Makaroff, and he will proceed at once to Port Arthur. He was born in 1844 and received the highest military distinction in the gift of the Czar, the cross of St. George, for bravery in the Russo-Turkish war. From 1901 to 1903 he was in command of the Pacific squadron.

Korea The palace of the Emperor of Korea at Seoul was completely destroyed by fire on the evening of the 14th. The origin of the fire is not certainly known, but it is supposed to have been due to the heating apparatus, which was being repaired. The value of the property destroyed is estimated at $1,000,000, but since the national archives were burned, the loss cannot be computed. The Japanese fire brigade did efficient work in preventing the spread of the flames to the foreign legations, which are close by. The European building outside the walled inclosure was saved, and in the library of this the Emperor took refuge. He prefers to stay here while the palace is being rebuilt rather than go to the Klong Box palace, where the Queen was assassinated in 1895 and from which he fled to the Russian legation.—All is quiet along the Yalu. The only conflict reported is a skirmish on Somalind Island, opposite Wiju, where, according to a report from General Kuropatkin, a Japanese patrol of fifty men were landed and were nearly all killed by Russians in ambush. General Kuroki's army corps of about 100,000 men is now entrenched on the Korean side of the Yalu, and a railroad is being constructed to connect this river frontier with the capital. About seventy miles of the railroad from Fusan to Seoul have been completed. The Russians are said to be holding Antung on the Manchurian side of the Yalu with a force of 20,000 men, but their main lines of defense are further west. There is reported to be a great deal of sickness in both armies. General Kuropatkin has prohibited the use of wireless telegraphy by newspaper correspondents in Manchuria under penalty of being treated as spies. Any neutral vessels equipped with apparatus for wireless telegraphy which are arrested by the Russian vessels will be confiscated. The dispatch boat of the London *Times*, the steamer "Hairnun," was stopped and searched by the Russians a short time ago, before this order was issued, and now it appears the correspondents must abandon the apparatus with which they sent the very complete descriptions of Togo's attack at Port Arthur.

Garrison and Non-Resistance

BY COUNT LEO TOLSTOY

READING the biography of Garrison I have again lived through the spring of my awakening to the true life. Reading the speeches and articles of Garrison, I clearly recalled the spiritual joy which I experienced twenty years ago when I learned that the law of non-resistance, to which I was inevitably drawn by becoming conscious of Christianity in all its importance, and which opened before me the great, joyous ideal of the realization of Christian life, had already in the forties been not only recognized and proclaimed by Garrison (of Ballou, I learned later), but also laid down by him as the basis of his practical activity in freeing the slaves.

This joy was at that time mingled with surprise as to how this great evangelic truth, expounded by Garrison fifty years before, could be so forgotten that I had to express it as something new.

My surprise was especially strengthened by the fact that not only those opposed to the progress of humanity but even the most progressive people were either perfectly indifferent or even opposed to the proclamation of this law, which underlies every true progress.

But with the lapse of time it became ever clearer and clearer to me that the general indifference and opposition to the law of non-resistance, which were evinced then and are still evident to-day, are but the symptoms of the great importance of this law.

"Our motto," wrote Garrison, in the middle of his activity, "from the very beginning of our moral fight, was: 'My country is the world; my countrymen are mankind.'"

Garrison, as a man enlightened by Christianity, starting out with a practical aim—the struggle against slavery—understood very soon that the cause of slavery was not a casual, temporary seizure of several millions of negroes by the Southerners, but an old and universal, anti-Christian recognition of the right of violence of some people over others. The means toward the recognition of this right was always the evil, which people considered possible to outroot or to lessen by rude force—that is, again by evil. And, realizing this, Garrison pointed out against slavery not the sufferings of the slaves, not the cruelty of the slave-owners, not the equal rights of citizens, but the eternal Christian law of non-resistance. Garrison understood that which the most forward champions against slavery failed to understand,—that the sole irresistible means against slavery was the denial of the right of one man over the liberty of another, under any circumstances whatever.

The Abolitionists attempted to prove that slavery was illegal, unprofitable, cruel, degrading, and so forth; but the pro-slavery champions, in their turn, proved the untimeliness, the danger and harmful consequences, which would arise from the abolition of slavery. And neither could convince the other. But Garrison, understanding that the slavery of the negroes was but a private case of general violence, put forth the general principle with which it was impossible to disagree,—that no one, under any pretext, has the right of ruling—that is, of using force over his equals. Garrison did not insist so much on the right of slaves to be free as he denied the right of any man whatever, or of any company of men, to compel another man to do anything by force. For the battle with slavery he put forth the principle of the battle with all the evil of the world.

The principle laid down by Garrison was uncontradictable, but it interfered with, and even destroyed, the foundations of the existing order of things, and, therefore, those that were satisfied with their position under existing conditions were frightened when this principle was proclaimed and actually put into practice. They attempted to pass it in silence, they hoped to attain their aim without the principle of non-resistance, which, it seemed to them, would destroy the well-built structure of human life. And as

the consequence of this failure to recognize the illegality of violence came the fratricidal war, which, solving the question externally, carried a new, perhaps even greater, evil of degradation, accompanying every war, into the life of the American people.

The essence of the question remained unsolved, and the same question, only in a new form, stands now before the people of the United States. Then the question was how to free the negroes from the violence of the slave-owners; now the question is how to save the blacks from the violence of all the whites, and the whites from the violence of all the blacks.

And the solution of this question in its new form will come about, of course, not through lynching the negroes, nor through any artificial and liberal measures of American politicians, but only through the application to life of that same principle which was proclaimed a half a century ago by Garrison.

A few days ago I read in one of the leading magazines the opinion of an intelligent and clever writer that my recognition of the principle of non-resistance is a sad and partly comical error, which, taking into consideration my old age and some of my deserts, one may pass with condescending silence.

Just such an attitude toward this question I met in my conversation with the remarkably clever and progressive American, Bryan. He, also with apparent intention to show me my error in a gentle and respectful manner, asked me how I would explain my queer attitude as to non-resistance, and, as usual, brought forth the seemingly uncontradictable argument about the murderer who kills or outrages a child. I told him that I uphold non-resistance because, having lived seventy-five years, I have never, except in conversations, met that fantastic murderer, who before my eyes wanted to kill or outrage a child, but I have constantly seen not one, but a million murderers outraging children and women and adults, old men and old women, and all working people, in the name of the permitted right of violence over their equals. When I said this my kind interlocutor, with his peculiar quickness of perception, did not give me a chance to finish, but began to laugh and found my argument satisfactory.

No one has seen the fantastic murderer, but the world moaning under the burden of violence is before the eyes of all. And yet no one sees, no one wants to see, that the struggle which can free mankind from violence is not a struggle with the fantastic murderer, but with those real murderers who employ violence over people.

Non-resistance means simply that the remedy of mutual influence of judicious people over one another should consist not in violence, which can be admitted only with regard to the lowest organisms, but in judicious conviction; and good of mankind should strive to this that all people wishing to serve for the substitution of force by judicious conviction.

It would seem, it is perfectly clear, that during the past century fourteen millions of people were killed and the works and lives of millions of people are still being spent on altogether unnecessary wars, and all the land is in the hands of those that do not work on it, and all the productions of the work of the people are devoured by those that do not work, and that all deceits which reign in the world exist but because violence is permitted for the sake of suppressing that which certain people imagine to be evil,—and that, therefore, it is necessary to try to substitute violence by conviction. And in order that this shall be possible it is necessary to renounce the right of violence.

But, wonderful thing, the most progressive people of our circle consider it dangerous to deny the right of violence and to substitute it by conviction. These people, arguing that it is impossible to convince the murderer not to kill the child, consider it impossible to convince the working people not to take away the land and the fruit of their toil from those that do not work, and therefore they consider it necessary to hold them by force.

And, therefore, however sad it is to say it, the only explanation as to the lack of understanding of the significance of the principle of non-resistance consists in the fact that the conditions of human life are so polluted that those who judge

of the principle of non-resistance suppose that the application of it to life and the substitution of violence by conviction would destroy every possibility of a well-constructed society and the conveniences of life they are enjoying.

But they fear this in vain; the principle of non-resistance is not the principle of violence, but that of consent and love, and therefore it cannot be forced upon men as a duty. The principle of non-resistance, which consists in substituting conviction for rude force, can only be adopted by free will. And in the measure in which it is adopted freely by men and applied to life—that is, in the measure in which people renounce violence and establish their relations on judicious conviction, only in that measure is true progress accomplished.

And, therefore, whether people want it or not, only in the name of this principle can they free themselves from enslaving and oppressing one another. Whether people want it or not, this principle lies at the foundation of all perfections in human life that have taken place and that are to come. Garrison was the first to proclaim this principle as a rule for the construction of human life. This is his great desert. If he did not then attain the peaceful emancipation of slavery in America, he pointed the way toward the emancipation of all people in general from the rule of brutal force. And, therefore, Garrison will forever remain as one of the greatest factors and champions of true human progress.

YASNAYA POLYANA, RUSSIA

"Spring O' The Year!"

BY SUSIE M. BEST

Mr. John Burroughs says the meadow lark sings "Spring o' the Year!" in April.

OH, tell me now, what is this song that I hear,
That trills in my ear;
"Spring o' the Year! Spring o' the Year!"

Oh, who is the messenger telling it clear
(Tho woods are still sere),
"Spring o' the Year! Spring o' the Year!"

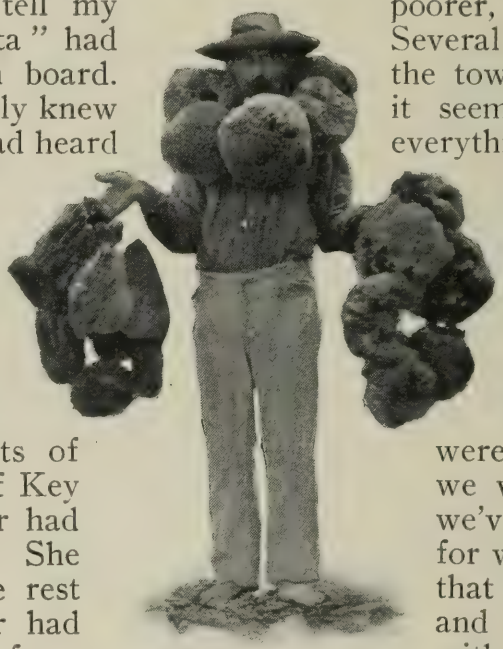
It comes from the meadow, it comes from the mere
Now far and now near;
"Spring o' the Year! Spring o' the Year!"

Oh, jubilant carol! What wo can appear,
What destiny drear?
"Spring o' the Year! Spring o' the Year!"

I surely but dreamed of the brine of a tear,
There's nothing to fear!
"Spring o' the Year! Spring o' the Year!"

Oh, courage, my heart; oh, my soul, be of cheer,
And harken, and hear,
"Spring o' the Year! Spring o' the Year!"

CINCINNATI, OHIO.



Fifty Years of a Sponge Fisher's Life

BY CARLOS BARKER

[The friend of THE INDEPENDENT who obtained the following article by Mr. Barker for us writes: "I am sending you the sponge fisher's story just as it came to me. He did not write it down, of course, but 'talked' it."—EDITOR.]

I WAS born in a palm-thatched shack under the tamarinds, on the green shores of Pelican Harbor, Bahama Islands. My father was an English sailor, but my mother was a Cuban-born Spaniard. I've got the dark look of my mother; I suppose I'm none the fairer, either, for a long life on sunburnt waters.

I couldn't have been five years old when a bad piece of news came to our little home. I remember, my two brothers and myself were playing out in the shade of a cocoanut palm when some one came running to tell my mother that the "Perdita" had gone down with all on board. Small as I was, I instantly knew what that meant. We had heard such tidings before of other vessels, and we knew how to take in the meaning of the dreadful words at once.

Grass, Sheep's Wool and Yellow Sponges

Life did not change very much for us then. We only went from the tamarinds and cocoanuts of the Bahamas to those of Key West, where my mother had a brother, a widower. She kept house for him the rest of her life. My father had been constantly away from home, and now my uncle, likewise a sailor, was nearly all the time gone, leaving his three children to my mother's care. So things were much the same with us, except that there were more playmates and a bigger house to come back to when play was over.

But playing-time is short with folks like us. School days came very early to my little brothers and myself. There are good English schools in Key West, and my mother had not forgotten her English husband; so she sent us to them as early as we could be admitted.

"For you are not Conchs, remember," she charged us, her eyes flashing and voice ringing; "and you must never let them call you so. You are English, and I want you to speak English, and speak it well, besides reading it and writing it, like your father before you!"

Since I've seen more of the world I've come to know that Key West is a strange town, unlike any other. There's an English part to it, and a Spanish part, the Spanish being bigger, but poorer, and, alas! much dirtier. Several languages are spoken in the town; Spanish most of all, it seems to me. But, above everything else, our island-town is American; that's why so much money is made and lost in it, and so many business enterprises spring up.

And what did my mother mean by saying that my brothers and I were not Conchs? Well, but we were, I think. At least, we've mostly been called so, for we've sponged with crews that talked the Conch lingo and we've spoken it regular with them. Yet we were taught good English and I speak it all the time in my own home.

You see, the name Conch was given, generations ago, by our neighbors on the main shore of the States, to the Spanish-speaking, mixed-blood people of Key West. You know the great, slimy thing that crawls around in a conch-shell? Dig him out, and he looks like a lump of muddy, nasty jelly. Some of our poorest people along shore no doubt eat these, but the dish isn't known on better tables.

I suppose the name was an insult at first; my mother said so, and felt it like a knife, because the Key Westers were said to use conchs as a staple article of food.

Anyway, the name Conch has clung, and most of us don't care at all for it now. There's a funnier name than that among us: when one of us marries into a mainland family the children are called "Loggerheads." In my life-time lots of the Conchs have married about Tampa and Cedar Key; so lately the Loggerheads in our crews are numerous.

Interior of Sponge House

I told you my school days commenced early. They ended early, too. One day, when my uncle came home from a long cruise I ran down to the wharf to meet him. But for an hour he was too busy to notice me. He was talking excitedly to José and Manuel Silvas, two turtlers we knew well and they were handling and passing back and forth among the three some wet, dirty-looking objects that I did not recognize. When I got very close I found out that these dirty objects smelt very bad. How well I've come to know that smell in the half of a hundred years that's rolled over my head since then. Most of the months of those years I've been out on the water, with the deck of my boat piled up with these same dark-looking, nasty-smelling objects.

For, you see, these were sponges that José and his brother had found out on the reefs when they were looking for turtles; and they were showing them to my uncle because his judgment and knowledge were much respected among all the sea-faring people that came in to the Key West wharves. The Silvas brothers kept telling my uncle over and over that there were wide fields of this strange growth out in the waters they had been turtling in, and my uncle, Alejandro Piestra, was running forward in his mind to the possibility of harvesting these and finding a paying market for them. Small as the incident appeared, a great United States industry had its beginnings right there.

As nearly as I can remember this happened about 1853 or 1854, and within a

Drying Sponges; Cheyney's, Tarpon Springs

few months my uncle had fitted out two or three small boats for the sponging fields of José and Manuel. I was scarcely eleven years old, but he put me on one of the boats.

"It's going to be a money-making business, Elena," said he to my mother, in his far-seeing way; "not now, perhaps, but one of these days. Let the boy learn it from the start and grow into it."

Even so it has been. At that time all the sponges used in the United States were imported. Now our own markets, with their big demand, are almost wholly supplied from our own waters, and there's a large export of the grass sponge to England every year.

But it's only in the Florida waters that sponges are found, and nearly altogether on the west coast of the peninsula. The water is too deep and too cold on the Atlantic side, and the hurricanes too destructive to sea life. Sponging doesn't pay in the Atlantic.

The sponge fields in the Gulf of Mexico are big, and they are pretty widely worked in the last few years. We call St. Mark's the northernmost tip of the fields, and they reach clear down to the reefs about Key West, stretching out fifteen or twenty miles from shore all the way. But they differ in fertility, just as the farmer's fields differ. The grounds that give us the richest yield lie between St. Mark's and Anclote Keys, and they are worked by a large force of men.

Yes, this is the finest and most valuable of all Florida's maritime industries, for it keeps several thousand men employed and a handsome fleet of vessels cruising along the western shores of the Gulf, and the yearly harvest means considerably over a million dollars to the State.

In those early days we had the awkwardest sort of sponge hooks and no water glasses, nor anything else to make our work easy or successful. I can't say we did succeed, either; we were not in the right place to succeed, even if we'd had good boats and the implements we use now. There are not enough sponges along the reefs we were on then, nor are

the ones gathered there of fine enough quality. But even with all odds against us, we were by 1858 or 1860 bringing in some catches that sold quite well, and drew other folks' eyes to our business. Some more men began to fit up boats, as my uncle had done, and to send out sponge-fishing crews. In a few years turtlers, mullet-fishers and many others that followed the sea were leaving their old work and turning to the new, because it offered so many more chances. The gamble in it drew the Conch, you see. Soon the boats were getting bigger and finer, and every year they pushed up further north, until at last they got to St. Mark's, and the sponges ended.

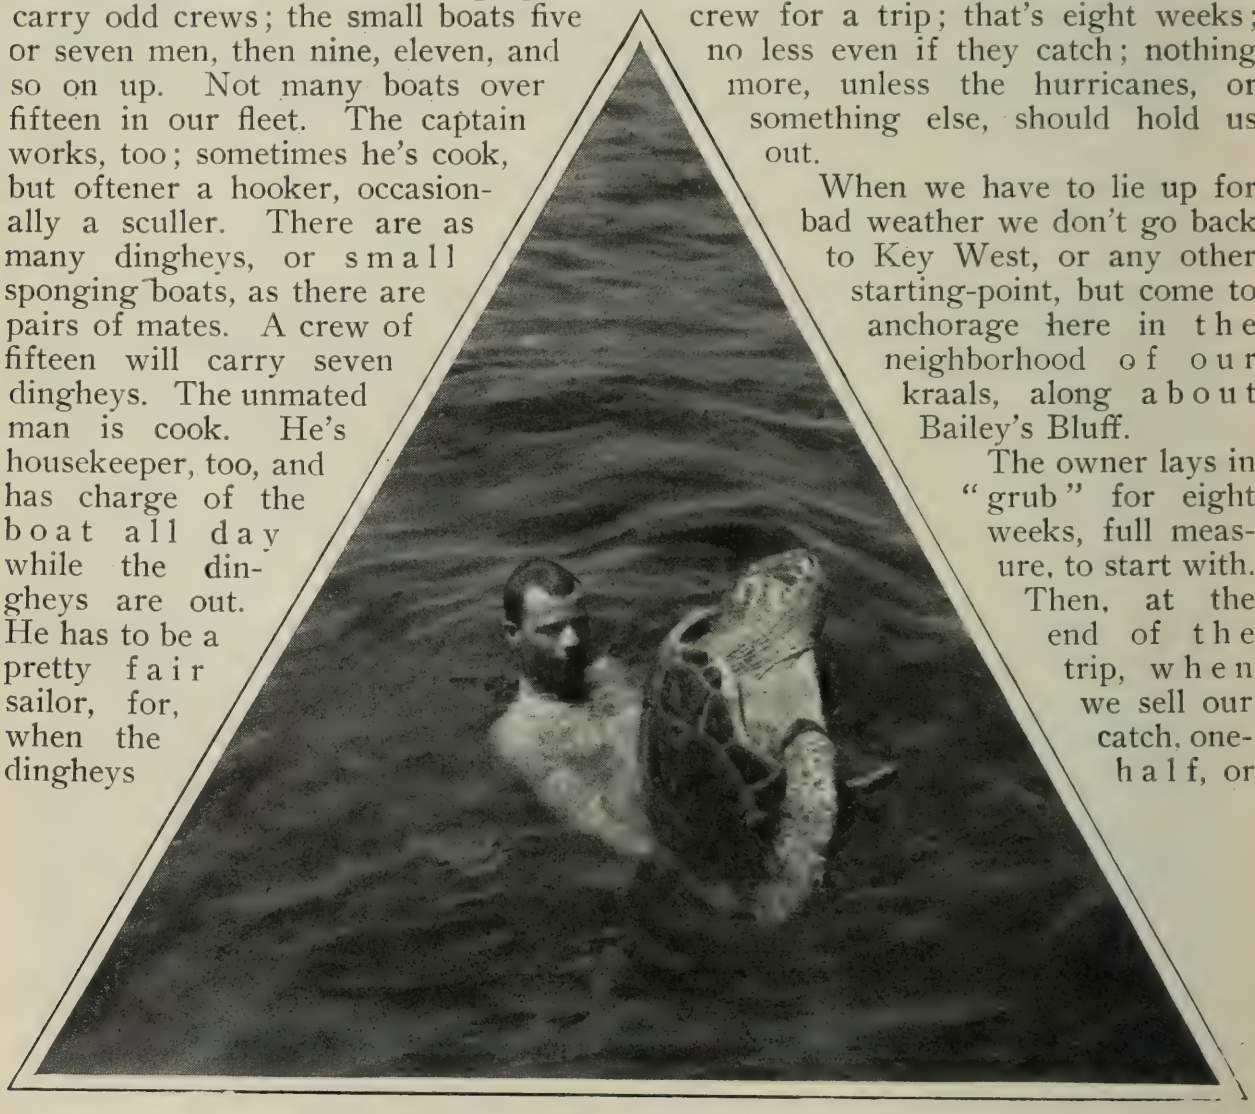
Somebody soon invented a hook for catching hold of the sponge and pulling it loose from the rock or coral bed at the bottom of the sea, where it grows. The sponging glass had come early. This looks like a common water-pail, except that it has a glass bottom. It is tied with a rope to the side of the dinghey, and the hooker, laying himself breast down across the thwarts and facing the bow, looks over the side into the water through this glass-bottomed bucket, held in his left hand, while his long hooked pole is in his right. His mate, the sculler, is in the stern of the dinghey, and if he's as good at his business as he ought to be, is sculling so easily and smoothly that the boat glides like a fish. The hooker up forward holds his water-glass plunged several inches below the surface all the time: that's to lose the ripple and so have a clear view.

At first, when we didn't have glasses, we brought up many an object that wasn't a sponge, and many a sponge that was worthless. We were fishing in shallow waters in those days, too. But nowadays some of our poles are 45 feet long, for fishing deep, where the finest sponges grow. An expert sponger rarely ever makes a mistake in his catch. The minute he sights his sponge he lets loose his glass to grab his pole with both hands; he aims true, gives a peculiar little twisting movement, mostly with the wrist muscles, and, dollars to doughnuts, he lands his catch in the bottom of the dinghey. If it's a fine, big sheep's-wool, worth something like $1.00 or $1.50 to us, maybe he and his mate take a minute to mirate over it; then back to business quick as a wink. The hooker faces down again, and reaches for his water-glass, which, of course, would have been lost if it hadn't been tied to the boat.

Near View of a Few Kraals; Fish Nets Drying in Foreground, Some of the Sponging Fleet in Background

All of this looks easy. But when the new men try it they find it about as hard a job as they've ever tackled. Very few spongers are good hookers and scullers, too. It takes much more experience and skill to make a hooker. I sculled from the time I was twelve years old, but I never got to be a first-class hooker until I was away 'long in years.

Do our men pair off for a whole season at a time? Mostly,—just like what some visitors to the kraals tell me about the "dory mates" at cod fishing, in waters up North. But sometimes the mates don't agree, and the Captain has to change them. It strains the hooker awfully if the sculler is rough, besides making it impossible to get a good catch. So there's plenty of room for quarreling over it.



No, our boats don't carry even-numbered crews in order to mate off. Where would the cook come in? And nobody's more important. All the sponging fleet carry odd crews; the small boats five or seven men, then nine, eleven, and so on up. Not many boats over fifteen in our fleet. The captain works, too; sometimes he's cook, but oftener a hooker, occasionally a sculler. There are as many dingheys, or small sponging boats, as there are pairs of mates. A crew of fifteen will carry seven dingheys. The unmated man is cook. He's housekeeper, too, and has charge of the boat all day while the dingheys are out. He has to be a pretty fair sailor, for, when the dingheys start out in the morning they may keep bunched and trail off together a great distance, and generally the cook is expected to sail the big boat in their wake, so he's ready on hand to pick up the men when meal-times come or their cargoes get heavy.

Nearly all our boats are owned and fitted out in Key West, tho lately there's an increasing number every spring from places like Tampa, Clearwater and Cedar Key. Not many spongers own their boats. Generally it's a business speculator in Key West, or some other port, who owns them. I know one man that sends out fifteen this season. My uncle had nine at work when he died. I always thought it was a pity he had to die before he saw what a big thing he had started in this industry.

But I was telling you how the boats are owned, and that leads up to how we get our money out of the business. The owner fits up his vessel, and engages his crew for a trip; that's eight weeks; no less even if they catch; nothing more, unless the hurricanes, or something else, should hold us out.

When we have to lie up for bad weather we don't go back to Key West, or any other starting-point, but come to anchorage here in the neighborhood of our kraals, along about Bailey's Bluff.

The owner lays in "grub" for eight weeks, full measure, to start with. Then, at the end of the trip, when we sell our catch, one-half, or

Sponger Diving a Sea Turtle

one-third the cash, according to the number in the crew, goes to the owner, and the balance is shared equally among the men, except that the one who's had the responsibility of being captain generally gets a little the most.

In good seasons we often divide big money. Now the trip just made by our boat was not a specially good one, but we calculate to share $54.00 to $57.00 to the man. Wait till we go the Rock Island trip; that's away up the coast, and we save it until late in the fall, because the sponging grounds are protected from the prevailing winds by the lay of the shore. Up there the waters are deep and the sponges fine, not only in size, but in color and texture. All these points count high in the value. When we come back from Rock Island, if good luck follows us there, as it ought, why, we expect to share close on to $100.00 apiece. We did the season before last.

Perhaps you don't understand the spongers' bounty system. Sometimes I think it's at the bottom of most of our troubles, at least of our men's not putting by something from the good money they make. I don't know whether it's fixed in many other businesses so that a man can spend first and then earn; but I know, if it is, it's the worse for the workers.

I'm afraid the spongers' bounty began with my uncle. He was always a liberal man, and so, when his crews asked for money in advance, they got it. When other men began to fit out sponging craft their fishermen demanded an advance, "such as José or 'Tonio had from Señor Piestra," and so it went.

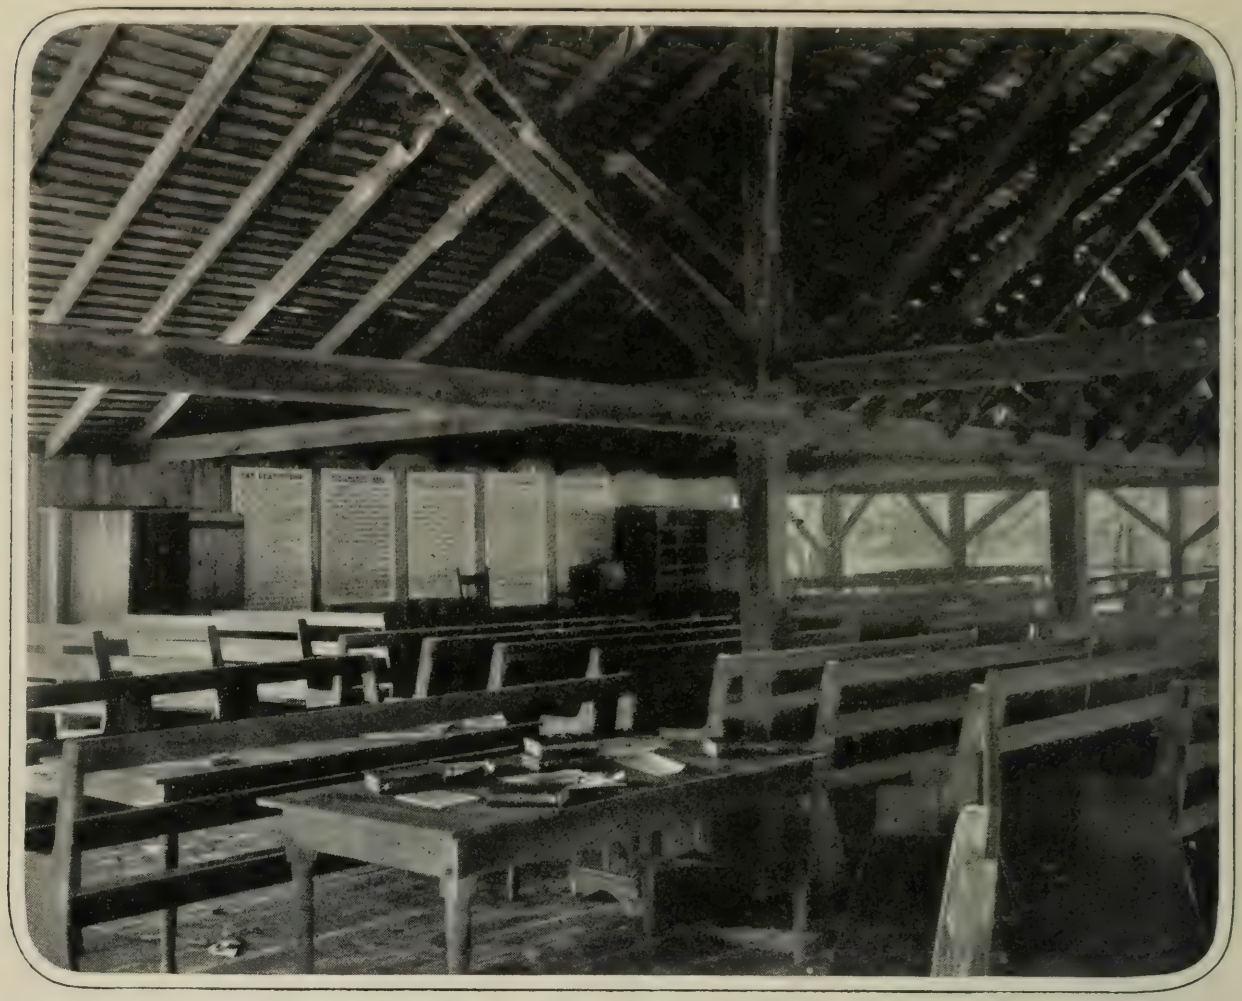
Now never a man would ship on a sponger without his bounty. You don't understand it perfectly? I'll make it plainer. Take the boat I work on, the "Juana." She carries a crew of eleven this year. Let's go back to Christmas times, as I told you of them. We're all out of money when January comes. Then we live on our credit for a month or more. A good sponger always has credit to live on—more's the pity, I think. It's late February before the "Juana" is ready to start out; that's as soon as the best of them goes. The water is generally too muddy for sponging before March. The owner of the boat hunts up the eleven men he wants about the last of January; some of us are old hands with him, some are new. He comes up to the first one:

"Going to ship with me, Pedro?"

Pedro is likely to answer: "How much bounty you give us?"

The owner asks back: "What you owing out?"

Then Pedro counts on his fingers, so much to so and so for "grub" since Christmas, and so much somewhere else, and maybe some other place. It mounts up to perhaps $25.00 or $30.00. The boat-owner is expected to stand for the debts first; then comes the bounty—that's always a cash advance.



"Thirty dollars on your debts, Pedro; I can't give you but $10.00 bounty."

Possibly Pedro takes it, perhaps refuses and goes to another master. But most likely he says:

"Rise to $20.00, Señor, and I'll take you!"

What does Pedro do with the bounty? Goes and spends the biggest part of it on a farewell "r'yster" before he ships, I'm afraid, leaving wife and family to be provided for while he's gone, maybe by the boat-owner, maybe some other haphazard way. There's tobacco to be laid in, too, from the cash, and sometimes clothes. Of course, the bounty and the debts must be squared to the owner out of what the sponger shares when the catch of this trip is sold. It won't leave much, if any. So into debt again, and another bounty before the next trip. You don't wonder I think it a bad system? But our men have grown to it till they wouldn't be willing to work under any other. Some people that have seen the world tell me the common run of farmers where they make cotton raise their crops with an arrangement pretty much like our bounties.

Well, our biggest squadron sets out from Key West in time to be on the grounds with the first fine weather, that comes so early in our climate. You can imagine you are starting with us, say, fifty boats together, our "Juana" leading. There'll be fifty more coming scattering later on, and another fifty, call it, from other ports. Our boats are of various builds and range from a 30-foot to a 70-foot keel.

Mission Pavilion; Glimpse of Interior of Anclote Kraals

If a gay little sou'wester sings through the rigging, so much the better; we won't mind crowding canvas if she's steady, for we're mostly good sailors. North-'ard we scud, and jokes are cracked, yarns spun, and cards played in our tight little cabins. Smoke? I should say we do. Did you ever see a sponger without his pipe, except at meal-time, or he's hooking? We'd never stand the smell of the dead sponges if we couldn't smoke.

But on this outgoing there's no smell; our boats are clean as wax, and everything is jolly enough. We love the salt in our faces again.

Two or three days' fair sailing will bring us in hail of Egmont Light; that's off from Tampa. We scud past it, and head on up. Fifty miles further and we come to our own Light; that's this one here, Anclote, and we run in to anchor off Bailey's Bluff.

Yes, it's a good harbor we've got here and sea-room for all. Tight anchorage, too. This bay is about central in our best sponge-fields, and so it came to be hit upon for the kraals.

You can see what the kraals are. They're only pens in the water, made by driving stakes tight and fastening together with hurdles. They're to hold the sponges while the animal part is being soaked out. All the vessels of the Anclote fleet have their separate kraals, of course, here, in the neighborhood of the Bluff.

Generally we put out for the grounds Monday morning, setting sail anywhere from midnight to daybreak. With good weather we fish hard till Friday noon, or even Saturday morning, anchoring wherever we happen to be every night, unless it's squally and we're driven to harbor. By Saturday noon every vessel tries to make it back to the Bluff. The sponges that have soaked a week are taken out of kraal, and the new catch put in. Enough for the men to do to fill most of Saturday and sometimes part of Sunday. The week-old sponges must be carried ashore, to be cleaned and bunched. Every piece is cleaned separately by holding it in one hand while you beat it with a stick until the refuse

is all out. When cleaned, they're gathered up and strung in bunches, according to size and quality, and the bunches then left to sun and air.

There's many, many a different kind of sponge, but only three we harvest for market: that's the sheep's wool, the finest, then the grass, and, last, the yellow. The sheep's wool brings us regularly from $2.00 to $5.00 a bunch. From seven to fourteen sponges make an ordinary bunch, but sometimes just one or two fine specimens will be bunched by themselves and bring $4.00 or $5.00.

The grass sponge isn't near so valuable, but it's been increasing steadily in price for the last five years, because England sends here for more and more every year. It sells now for three times as much as the yellow. You see, the yellow one looks muddy and coarse. It's very abundant all up and down our shores, but it don't cut much figure with us in years when we're getting good wool yield.

Our life looks easy enough to you when you see it this way, with the sunshine everywhere, and our boats rocking here in the Bay, the men lounging about or standing up for you to take their pictures. Perhaps it is easier than many. I know I'd die if you'd cage me up in a big city and set me down to some finicky piece of work. I've got to have searoom, and change my muscles often, besides. I'm thankful to be a sponger, instead of some factory or tenement fellow.

But maybe you've not thought of the hardest side? It isn't the work; none of us mind the work after we get started, tho a Conch's not the easiest man in the world to start. No, it isn't the hard work. It's the long, lonesome nights out in the Gulf, the murk and storm days, when there's nothing for us, when work would be a blessing; but instead we've got to sit around on deck, or be driven below by the rain or the smell, and have nothing for hands or brain but cards, a little fiddling maybe, and then dull talking to our few mates, and we know all they know, all they've got to say to us.

Then the week's end comes. But once more I can be thankful, for we've got the Pavilion now! Long, long years dragged over when we had nothing better to look forward to, at the end of every week, than just that same round of cards and pipes. Only we'd stretch our legs ashore and see the other crews. What else was there, unless we sailed up or down the coast to a breakdown in some Florida fisherman's shack, or perhaps cruised off to some town and tried a bad drunk on contraband rum? It's smuggled through from Cuba in large quantities along here, in spite of the cutters. You've no doubt heard the coast people speaking of it as "auger dent," which stands for the Spanish "aguardiente."

I'd like to have it said for our men, tho, that drinking is very uncommon among them out on the trips. Perhaps Conchs know their own weaknesses; aguardiente makes us quarrel, and quarreling would lead to killing every time when we're penned up together on the boats. So if drunk it must be, we wait till we're back in Key West.

But the Pavilion? It was Miss Stirling that got that for us. She was down here spending her first winter, when she used to visit the kraals and the Bluff, and see how lonesome and dull the men were on Saturdays and Sundays; nowhere to go, nothing to do when we were through cleaning. Just sleeping on our boats at night, and in the day-time, if it wasn't work, just loafing around our sponge-piles, or the keeper's shack, till it was time to start on another week's round.

The first thing we knew, Miss Stirling had started a fund for a Pavilion up here above the kraals. She put in a good deal of money herself, and got some from people a long way off, then some from the boat-owners in Key West and other ports. When the building was well begun she came among us for contributions, and we gave her whatever we could. She gives us credit for helping lots. That was three winters ago. In a few months it was finished up, and you see now we've got something to be proud of and enjoy forever. Why, I expect my children' children to get good out of that Pavilion.

You don't wonder I like to say it over and over, "Thank God, they built the Pavilion in my day!"

ARIPEKA, FLORIDA.

The Baptists and Christian Union

BY NORMAN FOX, D.D.

IN THE INDEPENDENT of February 4th the Moderator of the Congregational National Council, Dr. A. H. Bradford, submits "A Proposition for Christian Union" between Congregationalists and Baptists. A communication on such a subject from such a source demands consideration. What then is his eirenicon?

One concession suggested is: "Let the Congregationalists cease to emphasize the importance of infant baptism." But one might remark that they do not emphasize it now. In the Presbyterian Churches of the United States there were in the opening years of the nineteenth century nearly two hundred baptisms of infants to a thousand communicants, but in the closing years less than thirty, and in the more liberal Congregational Churches the usage has so far advanced in obsolescence that it has become the exception rather than the rule. It is proposed, therefore, simply that the Congregational authorities forbear to demand from Baptists what they do not require of their own people.

Nor is there any more of a concession in the suggestion: "Let Congregationalists be willing to immerse those who prefer immersion."

Immersion was the act of baptism in the Apostolic Churches, as any Congregational professor of church history will admit. It has been the baptism of the Greek Church through all the centuries. It was the standard baptism of the Church of Rome for more than a thousand years, and of the Church of England down to the reign of Elizabeth. It was the baptism of Jesus and Paul, of Tertullian and Cyprian, of Augustine and Chrysostom, of Anselm and Wyckliffe, of Cranmer and John Knox.. It is sanctioned by the Episcopalian "Prayer Book," and the Methodist Discipline. It was practiced by Mr. Beecher fifty years ago and has been by other Congregational leaders. It is no great yielding to recognize as valid baptism what no Church in all the ages ever denied to be such.

But, on the other hand, it is sweepingly proposed that Baptists shall consent to baptize infants and to use affusion for baptism; in other words, that the Congregationalists standing just where they stand now, not moving an inch from their present ground, the Baptists shall yield every point of difference, making unconditional surrender of their present beliefs, coming fully over to the Congregational position. Can they be expected so to do?

That Roman Catholics should baptize infants is reasonable. They believe in baptismal regeneration, that in the ceremony the child receives a new spiritual life, is "christened"—that is, made a Christian. But Baptists hold that one is christened, made a Christian, regenerated, not in any ecclesiastical rite, but by the direct work of the Spirit on the heart, and, therefore, as a monarch is crowned not to make him a king, but because he is a king already, so baptism can be used only as a token that one is already born again. Grant the Roman Catholic premise of baptismal regeneration and infant baptism becomes reasonable, but adopt the Baptist position, that the new birth is wrought not in baptism, but by the Holy Spirit directly, and baptism can logically be given only on profession of faith.

Whence did Protestants derive the usage of infant baptism? They derived it from the Church of Rome. And where did the Roman Catholics get it? They drew it from the doctrine of baptismal regeneration. The baptism of infants never would have been known in the Church but for the rise of the doctrine that in the baptismal water a new life was imparted. Therefore, to ask the Baptists to baptize infants is to ask them to sanction the Roman Catholic error that one is christened, made a Christian, in the baptismal rite, to abandon the evangelical tenet that regeneration is the immediate work of the Spirit.

Congregational and Presbyterian Churches of to-day escape these difficulties only by making their baptism of

infants mean nothing whatever. They do not consider the "dedicated," but still graceless, sons of a pious Eli to be Church members any more than do Baptists the unconverted young people in their congregations. They do not believe that there is any germ of spiritual life in the baptized child of Episcopalian or Presbyterian which will not be found in the unbaptized babe of Baptist or Quaker. They will not claim that the Presbyterian or Congregationalist labors more earnestly for the salvation of his "dedicated" child than does the good Quaker or Baptist for his unbaptized offspring. What significance then has infant baptism in evangelical Churches? None at all. Baptism to the Roman Catholic means something—namely, that the subject is therein born again. It means something to the Baptist—namely, that the subject has by the work of the Spirit been already born again. But the baptism of an infant in evangelical circles is utterly meaningless, and Baptists, while not judging their brethren, feel that it would be a profanation, a solemn farce, for themselves to adopt the practice.

Nor can the Baptist consent to use sprinkling or pouring as the act of baptism. He finds no Scripture precedent therefor, and he cannot consequently say "I baptize thee" in giving what he does not think Scripture recognizes as baptism.

And the practice of affusion is still further objectionable to Baptists for its having arisen from the erroneous doctrine that baptism is essential to salvation.

The act of baptism in the Apostolic Church was immersion. How, then, came sprinkling to be used? When there had grown up in the Church the belief that regeneration was wrought in baptism and only in baptism, and thus that no man could be saved without baptism, the question arose what should be done when a man was converted on a sick bed and immersion was out of the question. It was at last decided that *necessitate cogente* a simple affusion might be used. The recourse to sprinkling as baptism never would have been thought of but for the error that water baptism was essential to salvation. Till the twelfth century on the continent of Europe, and till the sixteenth in England, it was used only in case of emergency, the burial in water remaining the standard baptism, but in time its superior convenience caused it,—but only in the Western Church,—to supplant immersion entirely. But as the old Puritan refused to kneel at receiving the bread and wine because that practice originated in the erroneous doctrine of the Real Presence, so the Baptist must decline to administer sprinkling for baptism since that usage took its rise in the error of baptismal regeneration.

Be it remembered that what we should aim at is not simply union, but Christian union; and a union is not Christian which is attained through the sacrifice of principle. Now the Baptist does not seek to interfere with the religious usages of his neighbors. If they wish to baptize infants or to give affusion for baptism or to abstain from meat on Friday or to sprinkle themselves with holy water, he offers no objection, but simply asks that he himself be not expected to unite in ceremonies which do not accord with his principles. What causes the schism between Baptists and their brethren is that the latter deny them this liberty of abstention. Not long ago a Baptist, called to the pastorate of a prominent Congregational church, was asked in the installation council whether he would consent to baptize infants and use sprinkling for baptism, and it is safe to say that had he not beforehand agreed to answer this question in the affirmative he would never have been called.

Therefore, any plan of Church union which is to include the Baptist must stipulate that he be not required to baptize infants nor to use affusion and aspersion for baptism nor in any way, directly or impliedly, to recognize either of these as New Testament baptism. And he may go so far in demanding equality with his brethren as to claim that at any time when they are allowed to speak in favor of these usages he shall be permitted to state how it looks to him.

Be it observed that it would not be a union of Baptists and Congregationalists if one party was converted and went fully over to the views of the other. That would be simply a joining of Baptists and Baptist converts or of Congregationalists with proselytes to Congrega-

tionalism. The question is whether Congregationalists and Baptists cannot be gathered into one Church while each party still retains its present views, neither being asked to do anything inconsistent with its present principles.

The only practicable scheme for such a union would be one which waived entirely the question what constitutes New Testament baptism, which eliminated completely the discussion whether the use of affusion and the baptism of infants is according to Scripture. Such a plan would be found in a Church which admitted to the Church supper and to full membership any believer, *baptized or unbaptized*. If the Church welcomed to its ranks one, who, being of Quaker training, did not believe in water baptism and so had been neither immersed nor sprinkled, the Baptist member could vote to accept the person who had received only infant baptism without thereby impliedly acknowledging that such baptism is valid. Baptism would thus be made no longer a Church ordinance, but a question of private duty, like the giving of a tenth of one's income in benevolence. The member of such a Church could privately be immersed or sprinkled or have his children baptized by any one whom he could find to administer the ceremony, while the pastor of the church could decline to perform any rite in which he did not believe. In such a Church all controversy regarding baptism would be eliminated as thoroughly as from a Young Men's Christian Association.

If Congregationalists and Baptists could all be brought to see that water baptism is not made by the New Testament an essential to Church membership, that the Church of Christ should be open to all the disciples of Christ irrespective of baptism, then, tho each retained its own beliefs as to what constitutes true baptism, these two great bodies could become one. There are Baptist Churches in England which are organized on this principle, and there are Baptists in America who believe it to be the principle of the New Testament. Will the Congregational National Council respond by a resolution favoring the admission to the Church of all believers, baptized or unbaptized?

MORRISTOWN, N. J.

The German African Troubles

BY PAUL TAFEL

[Mr. Tafel is a German residing in New York, and his brother is one of the German officers now engaged in the fight with the natives in Southwest Africa. Ratzel's "History of Mankind," a standard work on native races, from which we take our illustrations, contains twenty pages on the Hereros.—EDITOR.]

THE appalling losses which Germany has recently sustained in one of her African colonies and the desire to learn the causes of the catastrophe have for a few moments turned our attention to that remote corner of the earth.

The territory known under the name of German Southwest Africa extends over an area about twice as large as that of the Fatherland, with the Orange River in the south, the Kunene River in the north and the Atlantic Ocean as its western border; the eastern part of the colony loses itself in the sandy plains of the Kalahari Desert. The first mention of this strip of land is found in Portuguese annals of the fifteenth century; later it belonged to Holland, and at the beginning of the nineteenth century it was abandoned by England after several successive expeditions had unanimously reported that the country was useless for agricultural purposes, that its mineral resources were insignificant and that it was inhabited by low and treacherous natives of the Kaffir type. It was small wonder, therefore, that a deprecating smile on the part of the entire colonial world greeted Bismarck when, in 1884, he proclaimed the hinterland of Walfish Bay between the Orange and Kunene Rivers henceforth to be a German colony. This action on the part of the German Government had been caused by the refusal of the authorities of Cape Colony to protect the German missionaries, who since the begin-

Herero Men. (From a photograph belonging to the Barmen Mission.) Reproduced from Ratzel's "The History of Mankind." Copyright, 1897, by the Macmillan Co.

ning of the second part of the nineteenth century had settled among the natives, from the continuous raids of the warlike Hottentots living along the Orange River.

It soon became evident that in placing that large tract of land under the protection of her flag Germany had assumed an onerous task. Aside of being poor in agricultural products, the country lacked the possibilities of an adequate water supply; the barren mountain ranges and large stretches of sand made transportation extremely difficult, and the coast was dangerous to approach on account of shallow water and sand banks extending far out into the sea—the only possible points of access being Walfish Bay (English) and Angra Pequena, to the south. The research for minerals

proved utterly fruitless, and the large cattle herds in the interior could not be made available for lack of proper means of transportation. The influx of settlers was small, and gradually the colony became forgotten by those in Germany who were at all aware of its existence.

In 1890, however, the fortunes of the settlement underwent a sudden change. A fierce invasion of Witbooi-Hottentots had utterly decimated the white population, and what cattle had not been driven off by the cannibals was destroyed by the rinderpest, which, at that time, ravaged over a large part of South and Southwest Africa. In view of this pitiful state of affairs the German Parliament acceded to the plea of the Colonial Office by granting a large and continuous appropriation for the colony.

The garrison was at once increased to 1,000 men, all white and recruited from the regular army, to keep hostile native tribes in obedience and submission. The few natural harbors were made accessible to large seagoing vessels, and regular fortnightly communication was established between Cape Town, Swakopmund (near Walfish Bay) and Hamburg. A railway was built from the coast to Windhock, the capital, and the principal villages were connected by telegraph lines, with an extension to the West African cable line, touching at Swakopmund. The trade of the colony, now amounting to about 12,000,000 marks, is mostly in the hands of about a dozen mercantile companies, with headquarters in Hamburg, London and Cape Town. A syndicate has recently opened extensive copper mines near Otavi and is now engaged in building a railway line to the coast at its own expense. The white population is increasing rapidly, augmenting itself partly from the Fatherland, partly from the former Boer republics.

The recent uprising of the natives in the interior has undoubtedly caused a serious setback to the development of the colony. It appears, from the reports which are periodically given out by the German Colonial Office, that the authorities have closely followed the example of our own Government in regard to the Indians in the West, inasmuch as the various native tribes have been assigned certain reservations of land, outside of which they were no longer allowed to settle. It further appears that the natives had acquiesced in this restriction of their liberty, that the white population felt perfectly secure from molestations of any kind, and that both, native and white man, associated and traded with each other without reserve. Evidently, however, the Germans—unmindful of the example of the English in nearly all their colonies, the Dutch in East India and the French in North Africa—omitted to constantly keep a watchful eye on the movements of the natives and to keep the authorities posted on the slightest change of sentiment or behavior. Thus it came about that the fierce massacre perpetrated by the Hereros on every white settlement they were strong enough to overpower took the commanders of the various garrisons completely by surprise.

Herero Spear*

Neither does it seem to have been known to the authorities that the settlers themselves were directly responsible for the catastrophe. Apparently it had become a practice among the white traders to sell more goods to the natives than the latter were able to pay for, that the payments were to be made on the installment plan, in the form of sheep or other cattle, and payments were exacted from the Herero until there was nothing left to him except the cotton trousers and other more or less valuable characteristics of a superior civilization which he had "bought" from the white man. In some instances also the greedy trader, on finding that his victim had nothing more to give, promptly proceeded to collect his debt from the Herero's neighbor. It is not surprising that the enraged natives lost their patience and slew whoever came their way, innocent or culpable, missionary, soldier, or tradesman.

* Copyright, 1897, The Macmillan Co.

Southwest Africa is the only vacant space on earth where Germany can settle her surplus population. The cattle raising capacity of the colony is unlimited and is more an engineering than an agricultural question, inasmuch as proper irrigation is a crying necessity, and the time may not be far when, in the way of meat supply, Southwest Africa will be to Germany what the United States is to her to-day and what Australia is to England. The experiments which the German Government is carrying on in and near Angra Pequena in the raising of cotton are reported to be very successful; the seal and guano trades are assuming greater propertions from year to year, and, finally, the shortest road to the gold and diamond fields of South Africa leads through this territory, and through it will lead the transcontinental railway, the building of which was advocated so strongly by the late Cecil Rhodes.

In view of these circumstances it may be expected that the German colonial authorities will not be caught napping a second time, and that in the future they will keep an eye on the doings of their colored as well as white subjects in Southwest Africa.

The Players

BY THEODORE ROBERTS

They played together in the silent room,
The shaded candles scarcely broke the gloom.

Outside—the stars, the scent of sleeping trees;
Red roses, and the thunder of spent seas.

Inside, fear stricken, still I watched the game,
Not knowing either player by his name.

I bent above them, holding my weak breath,
And wondered if my guests were Life and Death:

And one looked up, who felt my dread surmise,
And my poor strength ran out before his eyes.

His comrade dealt the cards, but kept his head
Low held, and blinked upon the black and red.

Outside—the starlight, and the garden-balms,
And the thin whispering of the seaward palms.

My garden smelled of roses, and the moon
Lit the straight surf beyond the still lagoon,

And all was clean, and soft, and passing sweet
With cool of trade-wind, and with garden heat.

All night they played. The low stars swung from sight.
I watched the players' faces, bent and white.

Then, of a sudden from the garden came
One whom I know by loyal heart and name;

One who might turn the frozen North for me
Into all joy beside my tropic sea;

One who might send me far to any land
And bring me back, boy-eager, to her hand.

At her sweet entrance dawn filled all the room,
And golden laughter touched the heavy gloom,

And soft, I felt upon my fevered lips
The dew-cool wonder of her finger tips.

"See, dear," she laughed, "the cards tost all about,
"The Players gone, the candles sputtered out!

"You thought them fearful gods of Destiny
"That were but memories of pain and doubt!"

Fredericton, N. B., Canada.

The Sweating Device Applied to the Home

BY ERNEST POOLE

[Mr. Poole is a resident at the University Settlement which is situated in the very heart of the East Side of New York. The present situation there is not only interesting in itself, but it may develop into a demand for the municipal ownership of tenements, and even result in a tenants' trust or union which might boycott landlords hostile to it, etc.—EDITOR.]

A WAVE of feeling has swept suddenly over the whole lower East Side of New York. Its cause is a rise in tenement rents, and the cause of this rise is congestion. For in this square mile of tall, grimy tenements live 600,000 human beings; most are of the Jewish race. It is the most densely populated spot on earth; it but shows the congestion so swiftly growing in all our cities, and the old but only half solved problem—how to make a tenement home wholesome and secure. On this problem and its solution the present agitation may throw some light.

Four years ago the more enlightened of the tenement people decided that their homes were too dark and foul for human beings to live in. The new tenement law was then passed to regulate the landlord in his building, his improvements, his housekeeping—in all his expenses. This law, so ably administered, has already begun to make the home wholesome.

But not secure—for the landlord can still raise the rents. Three times in the last three years the rents have been raised, and now the climax seems to have come in an almost simultaneous rise all through the tenements of from ten to twenty per cent.—even fifty per cent. in some cases. By this last sharp rise the people have all been thoroughly roused, and now they are groping for some means by which the home may be made not only wholesome but secure—some power by which the landlord may be controlled not only in his expenses, but also in his rents.

At present he cannot be controlled at all. The tenant now deals only with a sub-landlord, by a system of sub-leasing which has sprung up in the past three years. This is the sweating device applied to the home. In the shop, the subcontractor; in the home, the sub-landlord, or, to give him his popular name, "the cockroach." He began work four years ago and his growth has been phenomenal.

Here the making of the sub-landlord is as follows: A poor tailor, by closest economy, saves enough money to leave his sweatshop labor, rents the little store below his tenement and becomes a merchant. More close saving. He saves $1,000, rents the whole house and becomes the sub-landlord. For this he is now fully equipped. He still lives in the house; he has studied his tenants; he knows their personal traits, their likes and jealousies of each other, their ups and downs; he can make a close guess at their bank accounts. So equipped he drives individual bargains. In many cases he has forced the rents from a house in one year from $800 to $1,500. His great advantage is that of the subcontractor in the sweatshop. He can say that he is powerless, that the big landlord has raised his house rent, and that he must raise their rents to match.

Many other excuses for raising the rents the tenants have heard from the sub-landlord. First it was the new tenement law of 1900; second, the new East River Bridge, the new parks, schools and playgrounds, and third, the strike of last year in the building trades. It is true that these three causes have materially checked the power of supplying more rooms to meet the rising demand from the incoming immigrants, and so have enabled the landlord to put on the screws. But this was not the landlord's interpretation. He told the sub-landlord (who told the tenant) that the new law had increased his expenses by forcing him to put

in improvements; that the new bridge, the parks and the schools had raised his taxes; that the building trades' strike had raised the price of labor. The strike and the new law were to a small extent true reasons. They justified a five per cent. raise of rent, but not the raise of thirty per cent. that has come in the last three years. The other point—a rise in taxes—is generally false. Comptroller Grout states that altho for a few landlords taxes have risen, for the vast majority they are the same.

A far more real cause of the rise is the increasing speculation of real estate companies. There are some twenty large firms who handle two-thirds of these transactions. These are simply shrewd business men taking advantage of the rise in the demand for homes through the incoming immigrants. Their project, according to business standards, is entirely legitimate and natural.

One typical instance will show the effect of this swiftly spreading speculation. A man I know on Houston Street owned a house for which five years ago he paid $26,000. His sub-landlord thought that he was getting all that he could squeeze from the tenants. But values in the neighborhood had risen; a firm bought his house for $33,000 and sold it for $36,000. The new landlord has now raised his house rent $200, and the new sub-landlord has just raised his rents fifteen per cent.

Under all these excuses, true or false, given by the landlords lies one sound business reason for raising the rents—they can get it. The demand has risen; immigrants pour in each year in myriads—last week at Ellis Island 25,000 landed, and the natural increase is enormous. Four years ago eight per cent. of the tenements were vacant; now there are none.

While the demand for homes has risen, the supply, for the present at least, is limited. In the Bronx, in Harlem and in the Brownsville section of Brooklyn the rents have in the past year risen all the way from ten to fifty per cent. Even outside these districts the land is mostly in the hands of large speculators, who are only waiting. The moment the tide sets their way tenements will spring up and rents will rise. It is the old law of supply and demand. The rents must rise so long as the people will pay.

The people must do one of three things—move out, pay the higher rents or regulate the rents.

To move out, in sufficient numbers, is a matter of years. In the past three months three thousand families have moved to Brownsville, and in Harlem 40,000 families have already settled, in spite of the fact that rents there, too, are rapidly rising. But for the great mass this moving is prevented by the main labor of the lower East Side—the clothing industry. The workers must live near the shops. Will the shops move? While investigating a hundred sweatshops and factories last autumn I asked the contractors whether they could move. Invariably the answer was No. The industry is extremely irregular and highly specialized. It demands many coordinate shops close together and an enormous central labor market, where extra labor can be quickly obtained. This is the present opinion. It may change, but to change it will take years; and even so, while tens of thousands move out a hundred thousand will still pour in from Europe, and the lower East Side will still be a section of crowded tenements.

The second remedy brings up the question: Can the people pay higher rents? It seems likely that many of them cannot, especially since the rents have risen most in the cheapest tenements. It is said that the present rise—unless charity steps in—will cause some two thousand evictions. But the others, the great majority, can doubtless squeeze the extra two dollars out of their wages. Will they? The new country has aroused new desires, new ambitions, higher appreciations—a higher standard of living; and of all immigrant races the Jew is the last to allow these new standards to be held down by the endless clog which now confronts him. He forever strives to force his standard up. In the clothing industry he was quick to grasp through his swiftly growing labor union a large share of the recent wave of prosperity. In union shops the wage jumped up at least thirty per cent. But meanwhile the sub-landlord, living in the next room to the tailor, saw this; and rents in three

years have jumped thirty per cent. to match the wages.

How escape this sudden clog which now seems endless? The more radical socialists in mass meetings every night are preaching municipal ownership of the tenements—proposing that the city build and own tenements just as the great cities of England and Ireland have so successfully done in the past ten years. Whether the same causes will in time work here to bring this about is a matter soon perhaps to be decided. But the people do not seem ready yet to decide it. The masses do not climb the social ladder two steps at a time. They are climbing now one step—one unconscious step toward municipal ownership.

This step is the third remedy—regulation. They are hunting for some means of regulating the landlord's rents just as the new tenement law regulates his expenses. The landlord is telling them that this would be an unwarranted, outrageous, unconstitutional interference with his sacred property rights. But he told them this when the new tenement law and still older sanitary laws were passed to protect something even more sacred than property. So now in spite of his old complaint the people are groping for some power close at hand. They are willing to accept a reasonable rise of perhaps five per cent. in rent. But they want to have a voice in deciding what rise is just.

How exercise this control? Simply by applying their now familiar labor union principles to their homes.

One typical answer came from a big double-decker tenement on Monroe Street. Here the tenants all "struck." They refused to pay the higher rent and threatened to leave the house in a body. They distributed boycott cards broadcast, of which the wording was as follows: "Tenants, keep away from the house at —— Monroe Street. In the name of your children, we ask you not to hire any rooms in that house, as the house is on strike, because the rent is raised every month, and we want to put a stop to it once and for all. Keep away." The landlord gave in and signed leases at the old rents for the coming year. Through the past week this has been repeated in scores of tenements. In this one-house-strike lies the germ of a tenants' union.

A wider and more conscious expression of this idea has been heard in a series of mass meetings beginning last week with two hundred tenants and swelling last night (April 12th) to five thousand, including the most prominent East Side citizens. The purpose of these meetings is to organize a tenants' protective association. Already some two thousand members have joined, officers have been elected, including a salaried financial secretary, and a definite plan of campaign has been decided on, as follows:

First—tire out the landlords. As one Jewish editor expresses it, "Our plan is to clog the courts. Each case will be fought separately, and there are so many of them that the landlords will have to give in or else wait so long for a decision that they will lose more rent than they hoped to gain by their exorbitant increase."

The second move proposed is to pay the rents of those members who are clearly unable to pay—thus preventing the threatened evictions and the riots so likely to ensue.

The third move is to use far more widely the boycott. To quote one of the leaders, "The whole society will boycott the house of any landlord who is exorbitant."

As yet this is only an idea. Will it work? Is the feeling strong and enduring enough to carry it through? A few weeks hence this question may be better answered. But whether this idea becomes an institution this year or when next the rents are raised, the idea itself holds a germ which in this age of combination must surely live and multiply. It is the counterpart of the labor union. The sliding scale (of rents), the house chairman dealing for all with the landlord, the union card required to admit new tenants, the walking delegate—all these features appear in this plan. It holds too the principle of self-help—as was shown when the new society unanimously voted to return the $200 presented by William Randolph Hearst.

How to make a tenement home wholesome and secure?

In a word the situation is this. Shrewd

business men have seized the chance to make enormous profits. Their speculation is simply based on the rise of land values—raised by the causes I have given. It is a sound, fair, business proposition. Will it hold against the people?

NEW YORK CITY.

The Lull Before the Storm

BY J. H. DE FOREST, D.D.

[Our special correspondent in Japan, Dr. De Forest, incloses a personal letter with this article from which we quote as follows: "It is glorious to be in Japan at this time and to be in an interior city, where the real Japanese spirit is seen, rather than in Yokohama, where so much of friction occurs." His exposition of Japanese feeling is all the more interesting as coming from a man so enthusiastic in his sympathies for the people among whom he lives and works.—EDITOR.]

NO one out here writes about the troops without wondering whether his article is subject to fines in numerous sentences that seem innocent enough. Japanese writers, however, make no protest. They have the joy of knowing that things are going in fine shape, and they are perfectly willing to keep dark to any extent if secrecy is essential to success. They keep the people contented by making the most of the thrilling events that have taken place around Port Arthur, by sketches of the lives of the heroes of the navy, and they illustrate freely with portraits and gunboats and damaged Russian battleships. They love to draw on the history of the two nations whose deep sympathy has so impressed Japan, and the navy is spoken of as doing things "Nelson-like," while

Unlimbering, Ready for the Next Train

the attempt to block the mouth of Port Arthur is "Hobsonian."

It is strictly forbidden to mention the movement of troops. A country paper naturally mentioned the departure of a brigade without stating where it was going, and some Tokyo papers as naturally copied the bit of worthless news. Each one of these papers was fined $10 for this breach of press regulations, and makes no complaint. This official action only increases the number of tiny circles that interrupt telegraphic news as it appears in big characters. "In a recent engagement at ooooo the number of shells fired at the enemy was oooo," was the way the *Kokumin* of Tokyo announced the bombardment of Vladivostok. "Strange cannon sounds were heard in ooo direction," is another sample.

Yet we have liberty to photograph movements of troops and of anything pertaining to the army that is in open sight, tho, of course, printed descriptions here are not allowed. As soon as mobilization began the Buddhist temples and Shinto shrines took on new life. Soldiers flocked to them to bid farewell to the ancestral graves, to leave last requests with the priests, and to pray to their ancestors and to the gods of Japan for success. It has been the quiet assertion of Japanese warriors that they have no religion and no need of any, and the army has been practically closed to Christianity. Yet in this national crisis the ineradicable feeling of dependence on some divine power breaks forth in temple visitations and prayers and vows. Hachiman, the god of war, is especially besieged at this time, and since the soldiers have gone, the papers have daily accounts of the people of this and that village going to the local temples to offer united prayer and to listen to patriotic addresses.

Banners of All Kinds Greet the Troops on Their Way Toward Korea

While on this topic it may be well to say that the Christians are eager to send their representatives to the front, but the commanding generals are decidedly lukewarm. The Minister of War was approached by a Buddhist priest, who asked permission to accompany the soldiers. "What for?" "To bury the dead." "What do we care for burial! Our bodies may rot and our bones bleach on Manchurian plains for all we care. But if you want to go to work in transportation, as many as you like may go." One of the ablest of the Christians went with the same request. "What for?" again asked the Minister. "To comfort the soldiers." "What comfort do they want? They are not wounded nor defeated, and are in need of no comfort," was the reply. Yet it seems to be settled that three chaplains can go with each division, but so far no Christian has been

appointed. The Buddhists have the inside track, and the Shintoists come following after. The Bible agent at Yokohama, Mr. Loomis, however, received letters of recommendation to each division general for the asking, and it is certain that Christian chaplains will be on the field in some shape or other before long, just as they were during the war with China. For the Japanese have, and always have had, a decided admiration for intelligent religionists who embody in their life the spiritual power they preach.

To return to the movement of troops. When the march to the stations takes place the streets are lined with banners, under which stand crowds cheering the departing soldiers. The Educational Department wisely forbade schools to break up study hours for the sake of showing a patriotic spirit. But in interior cities this spirit could not be restrained, and in one instance at least the schools were closed for ten days, and the leading avenue was lined night and day with children and students of higher schools gathered under their respective banners, standing in relays, at times in rain and snow, to shout "*banzai*" to the troops. It was a cruel bit of useless patriotism, bringing sickness and even quick death to some who should have been in school or at home. But the banners fly all through the interior, 'way out in the rice fields as well as by the road side.

When the requisitioned horses come along with their loads strapped on their backs the best thing to do is to keep out of the way. These are not the trained cavalry horses, but farmers' horses that have never been in horse society, and are ignorant of the proper customs of horse intercourse. They are a pack of cussed fools. Instead of waiting to fight Russian horses, their one overpowering purpose is to chaw each other's heads, and with fearful yells to give each other rapid broadsides with their hoofs. It is perfect bedlam to stand near a train where these irrational animals are being loaded. As many as six or eight soldiers tackle one horse to pull and shove him into the car that holds six of these beasts. And when that car has its complement those six heads hitched high, those twelve eyes flashing fire, and those twenty-four hoofs playing in every direction fore and aft, form a sight never seen in America. "They're a bad lot," said the officer in charge; "but we'll replace them with Russian horses later on." If

"If you're going to take that battery, please capture me, too," said the veteran soldier with his medals on.

these animals were yellow and were let loose in sufficient quantities over the world, they would constitute the yellowest peril yet known.

What a flood of dangerous thinking that phrase, the yellow peril, has excited in the West. It has now appeared in the Japanese language, and by means of this hateful term the people are learning how one section of the West regards them. It has been the one aim of Russian diplomacy to make Europe afraid of the united East, trained and armed on Western principles. Russia has tried to make the world think that she is the guardian of civilization and humanity and Christianity in this part of the earth, and that the heathenish East, with its countless millions, is a real peril to higher civilization. The Emperor of Germany, with his painting of the barbarous hordes of the East invading the Christian West, has emphasized this race-hating term. Foster, in his "American Diplomacy in the Orient," ends his valuable book with the statement that "the yellow peril has been much discussed by writers and statesmen who have studied the problems of the East," and then he adds: "Sir Robert Hart suggests only two remedies for this impending danger. The first is partition of the empire among the great Powers, which he regards as full of difficulties; the second, a miraculous spread of Christianity which would convert China into the friendliest of friendly Powers."

There it is in black and white—the only two ways of averting this peril are to subjugate or elevate. The day is now forever gone by for subjugation. The only road that can ward off the peril is reduced to one—to treat these two great nations, Japan and China, with justice and sympathy. The real danger to the peace of the world is that spirit of international unrighteousness that takes wicked advantage of the present weakness of China to dupe and threaten her into concessions fatal to her territorial integrity. Russia's acts during the last ten years and Germany's lawless annexation of Kiao-chau are the real disturbing forces that make deep and abiding race hatreds. England, too, has used force all through the East. Whatever the merits of the so-called Opium War, a great nation believes that this evil and peril was forced upon her most unjustly. England has Hongkong, and when Russia meanly slid into Port Arthur, England quietly occupied Wei-hai-wei. When I first came to Japan, thirty years ago, England had hundreds of soldiers on the hights of Yokohama, and her fearless Sir Harry Parkes had told the Japanese diplomats in a fit of anger, with a tremendous blow of his fist on the table, that England could crush Japan as easily as his fist could crush an egg. Yet England is to-day the trusted ally of Japan. The whole East knows the difference between England's actions out here and those of Russia and Germany. Whatever wrong England has done, she stands more and more for international justice and open doors. Wei-hai-wei, tho leased to England on the same terms as Port Arthur is to Russia, conceals not the slightest danger to the integrity of China or to the peace of the East. But everybody feels that Port Arthur's lease to Russia means the ultimate lease of Pekin to her on her own sweet terms, and Kiao-chau means "the mailed fist" in the face of China all the while.

There is but one way to avert the yellow peril, and that is to put a final check to Russian aggression in the East for the first step. Then, whatever their record thus far, let the nations of the West henceforth be just and helpful to China, and also to Japan. Any attempt again to deprive Japan of the just fruits of her coming victory would do more to break the peace of the world than any other one thing. And the alliance of a great Christian nation with Japan is accomplishing more than all things else to prevent the increase of race hatred.

It is the golden opportunity of Christendom. And it is the glory of our United States, as Foster splendidly demonstrates, that in the main we have been fair and helpful and sympathetic in our relations with the East. Especially is this true of Japan. We have the love of Japan as no other nation, not even her ally, has. To be sure, our hasty and hostile legislation against Chinese laborers has alienated the hearts of the bright young men of China who would love to go to the United States for study, and has wrought wide distrust of the Republic. In so far as we have done this we, too, have given an impetus to this growing race hatred, and are, in the same way if not to the same extent, responsible with

Russia and Germany and England. Christian missions are utterly unable to quench this threatening peril, unless their unselfish efforts are cordially supplemented with Christian legislation within our own borders, and with even a higher international righteousness than we have heretofore manifested. This is what Japan and China expect of us, and I believe we are not going to disappoint them.

In this same line comes the question of Japan's annexation of Korea. It has been taken for granted by writers in the States that this would be the proper thing to do. But before the war began I repeatedly tried in vain to get a Japanese to acknowledge the propriety of this. Everybody knows what Russia would do, or Germany. But Japan pledged herself to the world ten years ago that she would defend the independence of Korea, and she stands there now. Poor Korea, her weakness and incapacity are a peril, especially to Japan, yet it is as certain that Japan will not annex Korea as it was that the United States would not annex Cuba. But Japan will insist that Korea wake up to modern methods, and build roads and schools and have just laws and open courts. Instead of assassinations there must be safety and order. The trouble is that Japan is hated worse than poison by Korea. The Japanese have treated these people with rudeness and insult, just as we foreigners used to treat the Japanese. But the going of Japan's ablest statesman, Marquis Ito, to the peninsula means that Japan will give her best in friendship and in true aid at this time of anxiety and of war, and later when victory brings peace.

While writing this a high official called to express thanks for the sympathy the United States is showing Japan. In his long and instructive conversation he said that when war was decided upon one of the generals here lined up a regiment and asked the soldiers one by one what he planned to do. The reply of every man but one was virtually: "I shall count it an honor to die for Japan." The one who gave a different answer said: "I want to capture a Russian general and receive a medal from the Emperor." This official went on to say that from old the Japanese soldier never cared for money, but only thought of duty. When the warriors went to battle it used to be the

An Ambulance Company Just Going Aboard Their Train. Those Beastly Horses Are in the Box Cars

custom to put incense in their helmets and then tie them on in knots that could not be untied. It was a preparation for death—the *kesshi* of which I spoke in a former article. So to this day the soldiers of Japan have no wages. In time of peace they each get for pocket money one and a half cents a day, and in time of war this is nearly doubled. Therefore there can never be any discontent among these men on the ground that back pay is due. As they have no money to send home, each city or village takes care of those families that are in want. There is no pension list save for officers. Disabled privates receive in a lump a small sum as a slight token of sympathy.

There is no lack of money for the war. Two hundred and fifty million dollars are in sight without any great strain upon the resources of the country. It has been the custom for ages to bury gold coins and bullion. Every farmer's family of a few generations has a number of these. They are coming to the light now. Nothing will be withheld that is needed for victory.

SENDAI, JAPAN.

A Woman's Relation to the Two Sexes

BY MRS. L. H. HARRIS

ONE does not hear so much now as was said a few years ago concerning the emancipation and advancement of women. This is because they have discovered that "emancipation" is elective. They are at liberty to choose between the most radical and the most conservative ideals, provided they take the consequences, as men have long been accustomed to do. Meanwhile, their actual advancement in the scale of things depends upon their attitude to men rather than to women. And the explanation of their rapid development is accounted for by the fact that they are more nearly related to men than to one another. This suggests a curious limitation, as well as the admirable adaptability in feminine character. Thus, the brotherhood of man is already foreordained in the very order of things, but the sisterhood of women is inconceivable. They have no mutual consciousness upon which to base such an ideal; their evolution depends entirely upon another hypothesis. They will never co-operate with one another, because, in the very nature of things, their chief hope and happiness depend upon their co-operating with men. Until marriage every woman is the unclaimed part of some man. She is his complement as he is her completion. And if she is never married, she is never finished. She may be a useful, brilliant member of society, but in her own consciousness she is incomplete. She is like a June day without its night of stars and silence, like a lily that does not lose its life in a white passion of bloom and fragrance. But besides this intimate relationship, she is even more dependent upon him for such mental completeness as she is capable of. It is the man, priest, scientist and artist, who adds new dimensions to her mind. Children receive instruction from women, but the normal woman does not to the same degree that she does from the higher masculine source.

The intellectual woman, once she is developed, apparently contradicts the theory as to the lack of relationship among women, but she is, in fact, the most conspicuous example we have of mental affinity to men on the one hand and of temperamental antipathy to women on the other. She may be willing to spend herself for their edification, but at bottom if her attitude to them is not a missionary condecension, it is one of magnificent indifference. Nor is she more congenial with women of her class; the more advanced feminine intelligences there are forced into the same social or domestic situation the greater will be the friction.

Men of this order may work together in harmony, but brilliant women are stars that demand single orbits, and they insist upon shining alone around the whole circumference of their circle. This is a wise instinct, for when one of them finds her way into a constellation of other women, less intelligent than herself, she becomes a marplot in her efforts to "improve" them according to her own standards, when it is an open secret that women do not rise or fall by feminine standards, but by those set for them by men; on the contrary, had the offensively aggressive female emancipator among women been elected to a brotherhood of men, however ignorant, she would not have adopted these high-handed tactics. There would have been in her manner a complimentary confession of masculine superiority because, between women and men of any degree, there is the art of adaptability cunningly implied or expressed, and there is the basis of an eternal concession which women never feel for one another.

The spiritually minded woman is no exception to this biological law of sex relationships. Women have more ways of being religious than men have, but they have less faculty for converting or forgiving one another than any other class of people in this world. A man first conceived the idea of establishing homes for fallen women, and while Christian women have followed his inspiration in this work, in the dark beginning not one of them would have had the heart or hope to conceive it. Even now there is less in common between one of these admirable women and the repentant creature whom she cares for than between day and night. Privately and personally she never receives such an one in consciousness on the same plane with herself. And even if God demanded it, she would not be able to accomplish such a magnanimity. Yet the same Christian woman will undertake the reclamation of the most abandoned man with an angelic cordiality, a sweet piety, that is as admirable as it is impracticable. And she will end by marrying him, whether he is reclaimed or not, because she is kin to him by nature and even in her most heavenly-minded consciousness, while to the unfortunate woman she is only related by form and by human obligations.

But it is the most attractive of all women (and we may add the most useful) who is most antagonistic to her own sex. She has a personal charm which her merely intellectual sister rarely possesses; and, unlike the entirely Christian lady, her piety is a sort of matrimonial aspiration after higher things. With the uttermost respect, she may be called the mating woman—that is to say, a creature so closely kin to man that she could not find a vocation in religious or intellectual pursuits. Once married she becomes the brooding mother-woman, a gentle negative creature, greatly to be prized as a social and domestic feature of the world's salvation. But, until married, she is restless, dangerous and incapable of a loyal, generous friendship for another woman, because she will not endure competition when it comes to the art of feminine blandishments, any more than the intellectual woman will tolerate greater wisdom in one of her own sex.

These women as a rule belong to the elemental type. They are often witty, but never reasonable; and in the presence of men as tremulous with unshed beauty as suppressed butterflies. But with one another they are simply "confidential," an evidence of the strangest mystery in feminine character. They are always intimate. Each is a forsworn priestess of the tender emotions, in whom the others confide. It is not that they are vicious, but naturally treacherous to one another. The "dearest" friends betray one another, know it, and yet, such is their frailty for confidences, when next they meet there will be the usual exchange of private scriptures. But the same women would keep a man's secret inviolate until death, and it is an open question if the angels in heaven could win it from them.

After middle age, however, the average woman begins to care more for women than she does for men. Her allegiance undergoes a psychic change, her eyes are opened, her judgment cleared, and she learns to appreciate her own sex fully. The characteristics that seemed to her hateful frailties long ago are defended now as their poetic distinctions. She sees in every girl the fair mirage of her own youth, in the pathetic careworn face of the young matron the gentle hero-

ism of *her* other years; in the mother of a grown family her own queen days when sons and daughters suddenly grew tall and proclaimed her. And for them all she has a chastened affinity. Men have passed out of her calculations. They are the things with whom she failed or succeeded, from lover and husband down to her youngest son. And however much she remains dependent upon them, she is no longer related to them in the same near way. She has survived them and returned to her own.

NASHVILLE, TENN.

Some Russian Military Commanders

BY CAPTAIN PATRICK MAHON

[The author of this article is well known in France as a writer on military subjects. He has, among other things, published a book entitled "My Russian Regiment," which established his authority on Russian army matters. Captain Mahon has also traveled widely in Russia, is thoroughly acquainted with the Russian language, and knows personally many of the leading Russian officers. He is a captain in the French artillery and is at present on duty in the French War Office.—EDITOR.]

ADMIRAL ALEXEIEFF is the Imperial Lieutenant, or "Namiestnik," in the Far East, a veritable Viceroy. He was given this important post because he was the personal and trusted friend of the Czar. Nicolas presented the Admiral a large yacht provided with a spacious and elegantly furnished dining room, where a hundred guests could be comfortably seated. But the sudden outbreak of the war prevented the arrival of the ship in Eastern waters, and it is still lying, I believe, in the harbor of Algiers waiting for the disappearance of ice so that it can return to the Baltic. The "Almaz," which means "emerald" in Russian, is really a rapid cruiser, and with such a vessel at his command Admiral Alexeieff would have been in a position to perform all his social duties in a way worthy of his high position.

It is considered that Admiral Alexeieff possesses political talents of a very high order. His apprenticeship as a commander-in-chief began in 1879, in these same waters where he now is, when he was captain of the "Africa," a fine cruiser built in the United States, which then flew the flag of Admiral Lessovsky. Later, Alexeieff became naval attaché at the Russian Embassy in Paris and in 1888 was charged with the duty of conducting the then Czarewitz, now Nicolas II, to Athens. In 1890 he served in the squadron commanded by that Prince, and in the same year brought the whole Imperial family from Sebastopol to Yalta, the winter residence of the Russian court. From these close relations with the Czar dates the favor which caused the Admiral to be appointed in 1895 to the chief command of the Russian Pacific squadron, and in August of last year to the high post which he now fills.

Admiral Alexeieff is 60 years old, of medium hight and a little stout. His face is more expressive than handsome and there is a delicacy in his manner, to which energy and decision are not foreign, however.

These same mental qualities, associated with personal courage that is above all praise, characterize the first of the lieutenants of the Admiral-General, Kuropatkin. The Commander-in-Chief of the Russian land forces is 54 years old, short as to stature, thick set and bearded. He has a forcible manner and the expression of his face indicates patience and tranquillity. There is something peculiar about his little eyes, half hidden under their lashes; they seem to indicate introspection and a character which is invincible because of its obstinacy. These appearances are not deceptive, for proofs of firmness abound in the career of Kuropatkin. If, in 1866, he was designated to take part in the Khokand expendition, it was due to the tireless patience he had shown as a lieu-

tenant in Turkestan. The major of his battalion had promised him vaguely, the year before, to give him a place in one of the companies which would be designated to march against the khanate annexed to Russia in 1876. So when the time came, Kuropatkin, attired in his best uniform and backed by his comrades, reminded the major of his promise. "Impossible," answered that officer; "you are the treasurer of the battalion and I need you where you are." In the Russian army the treasurer of a battalion is chosen by the vote of the officers. So Kuropatkin asked his brother officers to choose another in his place and to accompany him in a body to the major. But they were again dismissed with a No. Tho the other officers left the house the disappointed lieutenant remained behind in the vestibule as if on guard there. "What are you there for?" asked the major two hours later, when he went out. "I am waiting till you send me to Khokand," replied the young lieutenant boldly. "That I will never do," came the angry response. But when, eighteen hours later, he returned home, there stood the lieutenant in the same spot at the foot of the stairs. This time the major yielded good naturedly and exclaimed: "The devil take you; what can I do with such a head as yours? As it seems impossible to keep you out of the fight, go, with the blessing of God. The army at the front needs officers like you. I can find another treasurer."

Examples of courage and patience are found at every step of Kuropatkin's career and especially among the heroic deeds with which his name is associated during the campaign of the Balkans in 1877. In August of that year he arrived with Skobelef at the headquarters of the Grand Duke Nicolas, Commander-in-Chief of the Russians. Both came from Turkestan, where they had fought side by side and had become warmly attached to one another. Skobelef was 35 and Kuropatkin 29. He had gone through all the early dangers of the famous struggles of September 11th and 12th in the Green Mountain without receiving a scratch, when he came within an ace of losing his life. He was inside Redoubt No. 1, standing beside an artillery caisson, surrounded by a circle of officers, when a Turkish shell struck the caisson, the ammunition took fire and burst, covering the whole redoubt with fragments of shell. Every one of the other officers was thrown to the ground, Kuropatkin alone keeping his feet, tho he was struck on the forehead and had his cheeks and hands badly burnt. But he would not fall! The enemy, taking advantage of the confusion, rushed forward in the hope of getting possession of the work. But they counted without Kuropatkin, who now took command, drove back the Turks, and when the struggle was won suddenly swooned from the effect of the pain from the wounds and the burns which he had received from the bursting caisson.

It will be seen that Kuropatkin possesses all the best qualities of the true soldier, and his ten years' command of the troops in Turkestan shows that he knows also how to lead. As an administrator, too, he has few superiors, as is evidenced by the manner in which he conducted the War Department, whither he was called from the head of the forces in Manchuria, and where he has been for the past six years. Of him it may be truly said: "He is the right man in the right place."

When General Kuropatkin left St. Petersburg the other day in his special train, he was attired in the gray army cloak peculiar to the Russian officers, the shoulder straps embroidered with the Imperial monogram and the regulation saber at his side. But his friends know that, because of an old wound, Kuropatkin cannot use a saber of this kind, as it is impossible for him to deal a striking blow. He needs a pointed sword that can be used for thrusts. So the workmen in the gun shops of the Russian capital paid the General a delicate compliment by presenting him, on the eve of his departure, a sword made especially for him, bearing this inscription engraved on the blade: "God guard thee for the glory of Russia." So Kuropatkin starts for the front armed by the people, which is finer, perhaps, than being armed by fair ladies as in the days of chivalry.

With the first turn of the car wheel the other day at the St. Petersburg station General Kuropatkin entered

upon the campaign; for, as is customary in Russian military life, the train is the rolling habitation of the commanding officer at the front. The Russian General's tent, even during peace maneuvers, is a railway car, side-tracked at the nearest station. To it he returns every night. Tho General Kuropatkin's tastes are of the simplest kind—the black bread of the peasant and "kacha," a sort of pap, eaten by the common soldier, would satisfy him—a well appointed kitchen and a well supplied larder are found in the headquarters car. There are beds, too, for himself, his fellow staff officers and his orderlies, and stalls for his horses. The General's favorite charger is, of course, there. "The Marshal," as he is called, is a six-year-old, half-bred, that has an excellent record on the Russian turf.

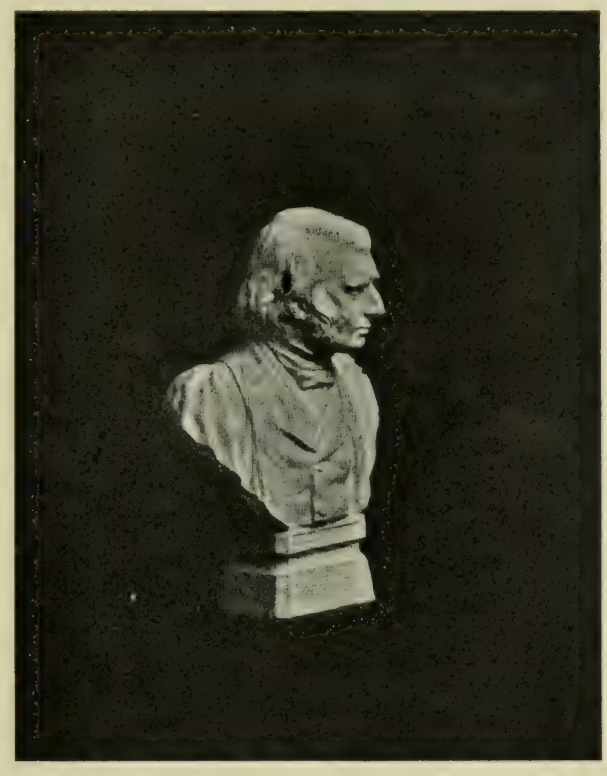
The new head of the General Staff is General Zilinsky, who has already been dubbed "the buffer officer," because he it is who will have the delicate duty of transmitting the instructions from the Namiestnik to General Kuropatkin. He is 50 years old and is considered a very able general staff officer. Having been Assistant Chief of the General Staff at St. Petersburg, he has learned General Kuropatkin's habits, which will now be useful to him. His fine-cut features, over which is spread a rather sad expression, speak in his favor. His health is said not to be too good, due to overwork. But, as was the case with Cæsar, war may prove to be a rest to his weary nerves.

General Flug, seven years younger than General Zilinsky, is a most agreeable officer. He has made an excellent record on the General Staff. It so happens that circumstances have kept him on duty for several years in the Far East, where he was at the head of the General Staff of one of the brigades during the Chinese campaign of 1900. Since that time he has not left Port Arthur, where he filled the post, as late as last February, of chief of staff to Admiral Alexeieff.

Among the other officers destined to play a part in the coming events may be mentioned General Linevitch, who will act as the assistant of the Commander-in-Chief. He commanded in China in 1900, and since then has been at the head of the first army corps in Siberia. Notwithstanding his unquestioned ability as a commander, and his wide knowledge of the Far East, the fact that he has never had any general staff training is against him and was probably the chief reason why he was not given the chief post instead of General Kuropatkin.

The Russian army in Manchuria is at the present moment formed of four corps. The commander of the first corps has a name that is well-known in Russian military life, Sakharof. There are not less than three generals of that name. The first has taken over the War Office during the absence of Kuropatkin, and may possibly be his permanent successor in that post. The second Sakharof is at the head of a division in Turkestan, while the third, of whom I am now speaking, has been in Siberia for the past four years. He won laurels in the Balkan campaign of 1877, and, like Kuropatkin, was closely associated, by the nature of his service, with Skobelef. After filling various posts, this General Sakharof happened to be in command of a brigade during the campaign of 1900 in Manchuria. This happy circumstance makes him one of the leaders in the present war.

Like General Sakharof, General Stessel made a reputation in 1900 as commander of the third brigade of light cavalry. This sturdy officer has spent the great part of his military career in Siberia, and like General Linevitch, has won all his promotions in the line service. He is an adept in the art of commanding the Russian soldier.



In a word, the generals in command in the Russian army of Manchuria are officers of experience, intelligent, and who know how to use all their knowledge. They are sure to be heard from.

PARIS, FRANCE.

Literature

Two Books on Ruskin

THE title of Mr. Collingwood's last addition to Ruskin literature* is a bit gruesome, calling up visions of bones and widows. Here the headings of the various chapters—Ruskin's Chair, Ruskin's Jump, Ruskin's Cash Book, etc.—prepare one for scrappiness and excite a suspicion that the text was written to fit the "50 illustrations by John Ruskin and others." This suspicious attitude of mind completely disappears while one is reading the first chapter, which gives a delightful account of Ruskin as a teacher. While he occupied the chair of Slade Professor of Art at Oxford Mr. Ruskin opened, at his own expense, a school to teach drawing. But, altho he was nominally Professor of of Fine Arts, he taught a little of everything. His chair, as Mr. Collingwood quaintly describes it, had four legs, one being drawing, the others literature, the dignity of labor, and nature study. This unique school, with its four-legged professor's chair, was well attended the first year, but afterward rarely numbered more than three pupils, of whom Mr. Collingwood was one. When the school was tired of trying to draw it was set to translating Zenophon's Economist, for the use of farmers, or to digging and building on the master's little harbor, not to make navvies of them, but to teach them the dignity of labor; just as the drawing school's chief end was not to teach them to draw, but to show them how hard it was.

A Bust of John Ruskin by Professor B. Creswick
From "Ruskin Relics." T. Y. Crowell & Co.

Later Mr. Collingwood accompanied Ruskin on a journey abroad as secretary, or rather "man-jack-of-all-trades." As an unconscious reward some of the master's surpassing power of painting word-pictures fell upon him. His descriptions of scenery and atmospheric effects are often Ruskin-like, but the gay humor which runs through his narrative is altogether his own. Very beautiful is his picture of Ruskin's garden, where the young growth of wood was allowed "to spindle up to great tall stem, slender and sinuous," like a "Botticelli" coppice, and "among those slender-pillared aisles you would not be surprised to see goddesses appear out of the green depths. Through this Italian altar-piece garden Ruskin walked, pruning knift in hand, cherishing each trail of ivy and each nest of moss. Thus Mr. Collingwood has succeeded in enveloping the merciless, often wayward art critic with the charm of a beloved personality.

Another writer, Dean Kitchin, in a volume of stray papers* gives us a picture of Ruskin at Oxford. The shy, home-bred boy tried his fellow students by "his innocence and harmless vanity," as well as by taking his studies seriously. He was saved by his "simplicity, good

* RUSKIN RELICS. *By W. G. Collingwood.* New York: T. Y. Crowell & Co.

nature and total freedom from vulgarity;" also "by his command of an excellent and even curious sherry wine."

The other articles in this collection contain much information about the ancient laws and customs of Durham cathedral and about other ecclesiastical communities and relics, all of which the Dean of Durham is well qualified to give. His account of the mission of Aeneas Piccolomini, afterward Pope Pius II, to Scotland is rather amusing. Specially amusing is his indignant surprise that the frescoe by Pinturicchio, which commemorates the meeting of Piccolomini with the King of Scotland, is not to be trusted. For the personages there depicted are not "such as one would have seen round the wild court of a Scottish King. There are no kilts, there is no sign of a Scot's plaid; . . . there is not a bare leg anywhere." This description by the irate Dean is only to be appreciated by one who remembers the pretty, elegant, boneless creatures who appear in all of Pinturicchio's paintings.

The quality of the Dean's book is slight, but it contains out-of-the-way information, pleasantly if diffusely given.

Asia and Europe

Now that the eyes of the civilized world are upon the struggle in Asia between Russia and Japan, this volume* will be very valuable to any one who desires to have a comprehensive knowledge of Asiatic questions. It is true that the work, now in a second edition, with the exception of a preface and an introduction, consists of articles contributed some little time ago to various English periodicals; but the opinions then expressed have a present bearing on the problems which will press for solution, no matter which party in the struggle is successful.

The author of this work spent many years in British India in close and sympathetic touch with Asiatic races; and the stand he takes may be gathered from these words of his preface: "All the papers are directed to one end, a description of those inherent differences between Europe and Asia which forbid one continent permanently to conquer the other." Mr. Townsend holds that in powers of mind and methods of thought, in religious motive and appreciation of morality, the genius of the Asiatic races is markedly distinct from that of Europeans. The two can never coalesce or work in unity in the cause of progress. This country has followed much the same line of thought in its treatment of the Chinese.

With regard to the retention of the countries which Europe has already conquered, he thinks that ultimately the teeming multitudes will overwhelm and expel the present dominant white races, but will again fall victims to the tyranny of despots of their own race. He declares that the Asiatic cannot understand government by law and will only recognize government by volition. According to this the Eastern mind is only fitted to be the tool of absolutism. This is a point well worthy of the attention of our legislators in dealing with the Philippines.

The volume must not, however, be regarded as a pessimistic one. That is not its tone. It is rather a calm, judicial, in some ways philosophic, estimate of the two races when living side by side under conditions with which the writer is fully conversant. And one matter in connection with this attitude of mind is that the author of the book stedfastly opposes the education of Asiatics in the methods and curricula of the European. His reason is that it does not change the characteristics. It only exaggerates the differences. Mr. Townsend took an active part in the movement to confine the curriculum of the Indian schools to native languages, literature and arts, was in the defeated party, and regrets the results of the successful scheme. This point is one upon which we may well take thought when dealing with the education of the Filipino. Can we make him an American citizen? Will he, in spite of all that we can do for him, remain Asiatic? Mr. Townsend tells us of a curious result alluded to by the Governor of Madras. Notwithstanding the fact that the colleges were full of natives successful in branches of such useful arts as engineering, the native works lay idle, the resources unimproved, because

* ASIA AND EUROPE. *Studies Presenting the Conclusions Formed by the Author in a Long Life Devoted to the Subject of the Relations Between Asia and Europe. By Meredith Townsend.* New York: G. P. Putnam's Sons. Second edition. 1904.

the Europeanized Asiatic would not go to such work, *but must take part in the government,* even if it were only in some subordinate civil service position. This, too, is a subject for serious thought, now that America is going outside her native race on the errand of civilization. Let any one read "Will Conquest Vivify Asia," and think.

Modern Practical Theology. By Prof. Ferdinand S. Schenck, D.D., Professor of Practical Theology, Theological Seminary of the Reformed Church in America, at New Brunswick, N. J. New York: Funk & Wagnalls Co., $1.00.

Sermon and Preacher. By the Rev. W. J. Foxell, M A. (Lond.)., Rector of S. Swithins, London Store with S. Mary Bothaw, E.C. New York: E. P. Dutton & Co., $1.25.

Representative Modern Preachers. By Lewis O. Brastow, D.D., Professor of Practical Theology in Yale University. New York: The Macmillan Co., $1.50.

In estimating books on homiletics and poimenics the questions of merit and value are somewhat separate. A book may have merit as a text-book for a class-room and yet be of little value to the outside world. Dr. Schenck's book is one of this sort. High ideals are set before the students and a high grade of work is demanded of them. For this the book is to be heartily commended. But after a man has left the seminary he will not find such a book very valuable, and it possesses no interest for any but preachers or those preparing to preach. All this holds with respect to Mr. Foxell's book, but one is tempted to ask why it was published. For while it is well enough written, yet it is neither a regular course of lectures delivered in the class-room by a duly appointed teacher, nor a series of special lectures upon invitation of the faculty. It is made up of what the author calls essays, originally printed in the *Church Times, Guardian* and elsewhere, and addressed to preachers at large; and when any one attempts to do this he must either have a clear certificate of his "call," or such a message as shall command attention. Mr. Foxell does not appear to have either. Dr. Brastow's book is of a different type from both the above. The lectures were delivered to the divinity students at Yale and are of a very high order, but they are absorbingly interesting to preachers and should interest all thoughtful laymen. The men chosen as representatives—Schleiermacher, Robertson, of Brighton; Beecher, Bushnell, Brooks, J. H. Newman, Mozley, Guthrie, Spurgeon—differ much in many things, yet each one compelled attention and left a deep impress. In each case there is an analysis of the preacher's temperament and tendencies; the peculiar setting of time and place is given, and an estimate is made of the bearing and influence of these things upon the man's preaching. But little attention is paid to the purely mechanical part of making sermons, yet there is enough to make the book very valuable in this respect, too, to young preachers. In this book we have both merit and value. It is well worth reading by every thoughtful person, whether preacher or layman.

Champlain. By Edwin Asa Dix. New York: D. Appleton & Company, $1.00

This is a vigorous and animated narrative of the exploits of the great explorer who has been aptly named the most picturesque figure in all Canadian history. It was a difficult task to condense the life history of Champlain into a few hundred pages and at the same retain its romantic and dramatic coloring. This difficulty has been surmounted with talent and success. Mr. Dix has evidently mastered all that has been published on his subject, has gone to original sources, and has made effective literary use of his knowledge. Above all, he is in love with the heroic Frenchman, an excellent quality in a biographer, for such enthusiasm is generally catching. Not the least attractive portions of the book are the opening chapters, which deal with Champlain as a soldier under Henry of Navarre and as a sailor in the Spanish service, a part of his career which has been heretofore rather unfamiliar to the general reader, altho Champlain wrote a detailed account of his voyages and was the first to give the French authorities a full report of the mysterious and closely guarded secrets of the Spanish main. The varied and valuable experience thus gained no doubt had much to do with his after success as the founder and governor of New France. In describing his second and his greatest *rôle* the author is

at his very best, and brings vividly before us his qualities as a crusader, a romance-loving explorer—a type of the medieval knight, and, withal, a Frenchman with the qualities of which the Anglo-Saxon claims the exclusive possession, patience, self-control and an entire absence of vanity. The illustrations, reproduced from drawings by Champlain himself, are very curious and interesting, especially the three fights with the Iroquois; and the same may be said of the map showing Champlain's journey to the country of the Hurons.

Mary of Magdala. By William Winter. New York: The Macmillan Co., $1.25.

It is seldom that a drama which has appeared on our stage is able to sustain the searching ordeal of print. Mr. Winter's *Mary of Magdala,* therefore, has a peculiar interest, inasmuch as it has been performed successfully by Mrs. Fiske. At the same time, like so many of our practical dramas, it is not an original conception in English. By the evidence against us it would seem as tho we were incapable of excogitating a genuinely dramatic idea for ourselves, tho we may do well enough in elaborating one. In short, Mr. Winter's play is a versified adaptation from Paul Heyse, considerably softened and in some respects emasculated. Mr. Winter objects to the German original as likely to be offensive to the English taste. It is still pretty difficult for the ordinary man to consider the New Testament as a mere source of literary material, in spite of all the recent efforts that have been made to secularize the narrative. And in deference to this character it is inevitable that some sort of sentimental attenuation should take place in the original story during its conversion into literature. The idea of Judas is a case in point. In the Gospels the idea of Judas is perfectly clear, distinct and intelligible. But the modern converters have befogged that idea and reduced Judas at last to the condition of a meaningless nondescript. Something of the same sort has gone on in the case of Mary Magdalene, until finally in Mr. Winter's version the sense of the whole story well nigh disappears under the haze with which it is discreetly enveloped. It seems as tho the adapters of such stories were moved, consciously or instinctively, by a desire to secure for their literary work the advantage of feelings that do not properly belong there—to profit, that is, by a confusion between religion and literature. At all events, if these matters are to be repeated in literary-wise, it is certainly more effective, as well as more reverent, to keep in their original clearness the ideas which alone give the story its momentous significance. In the treatment of delicate subjects of any kind a firm handling is the best. Heyse's prose is simple, direct and realistic, and in his drama Judas and Mary are genuine human beings, altho very different in some respects from their Gospel prototypes. It is a pity if they have to be poetized for the Anglo-Saxon public.

The Path of the Stars. By Marguerite Crosby Munn. New York: Dodd, Mead & Co., $1.50.

To those who have only a ballad sense of music this novel will prove confusing. Nothing in the situation or incidents recorded justifies the great title, yet the heroine seems unaccountably moved in celestial directions. Possibly this is due to the singing temperament, but most people will think it is a sublimated form of hysterics. And nothing excuses her in deliberately choosing a seat outside a public building upon which to languish, pale and graceful, with closed eyes. Such a figure is sure to attract attention, but, on the whole, it is too operatic a way of appealing to the passing multitude for a lover. Some man will come at last, of course, bear away the frail form, unpin her necktie and do the usual things which restore anæmic women to consciousness; but he is more likely to conclude that he has found a chorus girl than a high born lady in distress. The latter is much more particular as to where she will give away to her emotions, even when they are purely musical. And nothing could induce one to faint at high noon in a public place. She has more sense of the fitness of things. The latter part of the story is equally confounding. Nothing but a plague would explain the silence which seems to reign in the streets of a great city. Nothing is heard save the conversation of the characters in this story and the singing of the young lady, which she

assures us is remarkably good. And finally, it is impossible to say what the path of the stars has to do with the characters. So far as we can make out they are scattered quite naturally along the dirt roads of our common earth. But, doubtless, this obtuseness is owing to a lack of the musical consciousness on our part. Still, we venture to advise the author not to undertake another novel until she feels better. She gives the impression of being constantly obliged to resort to smelling salts while she composes. This is too trying upon the poor reader, especially when he does not know what the trouble is.

The Gods of the Egyptians; or, Studies in Egyptian Mythology. By E. A. Wallace Budge, Keeper of the Egyptian and Assyrian Antiquities in the British Museum. With 98 colored plates and 131 illustrations in the text. 2 vols., large 8vo. Open Court Publishing Co., Chicago, $22.00.

Dr. Budge has been for twenty years a diligent student first of Assyriology and later of Egyptian, Coptic and Syriac literature and archeology. His position in the British Museum has given him abundant opportunity for these studies, and he has written and published much, especially on Egyptology. These two sumptuous volumes follow his large work on the Book of the Dead, and embrace his conclusions, given in such a form as to be of value to the student and of interest to the amateur. First Dr. Budge discusses through three hundred pages the much disputed subject of the Egyptian conception of divine unity or complexity, of the underworld and the succession of gods. This part covers the passage of the Sun through the successive houses and portals of Tuab, the underworld, but it does not come in the scope of this work to discuss the scenes of the passage and judgment of the soul as given in the Book of the Dead. The remaining two hundred pages of volume I, and the whole of volume II, are devoted to the discussion of the several gods, and are profusely illustrated with admirable plates in color on a background imitating papyrus. The reader will be interested in Dr. Budge's view of the attempt of King Amenhotep IV to introduce a monotheistic, or henotheistic, worship of Aten, represented by the solar disk. He calls it a "foolish attempt," and yet other scholars have regarded him as a great, if unsuccessful, religious reformer. Dr. Budge, however, regards the Egyptian religion before Amenhotep as essentially monotheistic, at least in the time of the Fourth, Fifth and Sixth Dynasties, when the "Precepts" of Ptah-hetep show the recognition of a *Deas exsuperantissimus*. He says (i.p. 155):

"The general outline of their religion is clear enough, and it shows us that they possessed a good, practical form of monothesin and a belief in immortality which were already extremely ancient, even in the days when the Pyramids were built."

We wish such a conclusion could be substantiated. The conclusion is much too strong as to monotheism. A bit surprising is our author's characterization of the Hebrew Heaven. "The simple material," Egyptian Heaven, he says, is "very different from the Heaven of the Hebrew and Mohammedan writers, with its sensual and sensuous joys of every kind, and its luxurious meats and drinks and delights," p. 166. It would be difficult to find such a Heaven depicted in the Hebrew writings. He says again:

"The Heaven of the Egyptians was better and purer than that of many more modern nations, which are credited with higher intelligence and better civilization."

How much better was it when the highest Egyptian ambition was to sit down in eternal rest, while the *ushabti* servants did the *corvée* work for him? The volumes, imported from England, are richly illustrated, and are beautifully and accurately printed. Scarce a typographical error meets our eye. We note that on p. 66 the name of the Coptic lexicographer Tattam is printed "Tatham." The price of the volume is prohibitive to scholars of moderate means.

Problems of Living. By J. Brierley, B.A New York: Thomas Whitaker, $1.40.

The problems touched upon in Mr. Brierley's papers are religious problems, such questions of faith and the spiritual life as come to men of some degree of thoughtfulness and moral earnestness. Religious perplexities of a varied sort are handled with kindly sympathy, and with

unswerving confidence in the authority of the spiritual, the right of the soul to fix a final verdict. Mr. Brierley has the valuable quality of suggestiveness; he does not bring you to the end of a question, but he opens it up attractively, sets you forward with a few real insights, adds a biographical touch and an epigram which you vow you must always remember, and then provokes you to forget it all by suggestion of another question yet more fascinating. A book of problems, which is nevertheless a witness that there is still faith in the earth.

A Brief History of Rocky Mountain Exploration. [Expansion of the Republic Series.] By Reuben G. Thwaites. With illustrations and maps. New York: D. Appleton & Co., $1.25 net.

Mr. Thwaites's work is a careful and comprehensive account of Western exploration from the period of the Spanish voyages along the California coast to the outbreak of the Civil War. Wide research is shown, and every important happening in that most wonderful history is recorded. The work is a model of its kind, packed with information, systematically arranged and distinctly told. The account of the Lewis and Clark expedition is particularly to be praised, in that it traces, step by step, as well as that can be done in so brief a compass, the route of the explorers, identifying the chief landmarks and recording the main incidents. Much less space is given to Frémont, altho warm praise is accorded him for his intrepidity and the thoroughness with which he did his work. A high degree of accuracy characterizes the narrative, and in a volume so filled with names, dates and statements this is remarkable. But the error on page 231, in which President Tyler is referred to as President Harrison, is unfortunate. It would appear to be a mere inadvertence if it were not for the fact that it is repeated and emphasized in a footnote.

The Story of Extinct Civilizations of the West. [Library of Useful Stories]. By Robert E. Anderson. New York: D. Appleton & Co., 35 cents.

A brief account, in a familiar style, of the civilization of the Aztecs, Mayas and Incas. In addition a glance is given to the various tales of pre-Columbian discoveries in America and to the legendary settlement of Northmen in Massachusetts. Cortez's conquest of Mexico is related at some length, and a briefer account is given of Pizarro's conquest of Peru. While excellent as whole, the book is faulty in several respects. The narrative is hopelessly disjointed at times, there are some needless repetitions, and there is a lack of consistency in the spelling of proper names. "Acolhua," for instance, is spelled in four ways, and "Tescuco" in two. Some other slight faults might also be named. But, in spite of these defects, the work is to be highly commended. In no other book, in so brief a space, is crowded so complete and scholarly an account of the extinct civilization of this continent.

Galdos's Dona Perfecta. With introduction, notes and vocabulary by E. Seelye Lewis, Ph.D. American Book Company, $1.00.

Alarcon's El Nino de la Bola. With notes and vocabulary by Rudolph Schwill. American Book Company, 90 cents.

It is hardly necessary to say anything of the literary merits of these stories; the first is generally regarded as the author's masterpiece, and altho the sceond is not so well known, it is, like all Alarcón's novels, simple, at times dramatic, and replete with healthy humor and sound morality. They are well but not overedited, and are admirably suited for the special purpose for which they are designed. The vocabularies, which we have examined with some care, are unusually complete. This is a high merit in the present case, for there does not seem to be a really good Spanish-English dictionary in existence. The vocabulary of *Doña Perfecta,* especially, includes all the idiomatic uses of the words and phrases in the text. The editor, too, has adopted an ingenious plan for forcing the student, whether he will or not, to familiarize himself with the idioms that fairly bristle on every page. To give an instance: This seemingly unmeaning phrase occurs on page 13: *están que no viven.* The pupil looks up *estar,* and, after wading through the idioms under it, is sent, much to his disgust, to *vivir,* when he learns that it means: *they are on pins and needles.* This capital device is universal throughout. These little books can be cordially recommended.

Editorials

Tolstoy Garrison and Non-Resistance

It is worth while to print what so able a man as Tolstoy has to say on Garrison and non-resistance, but it is not well to let it pass without comment and correction.

Everybody that knows Tolstoy knows that he is what is called a Philosophical Anarchist. He actually believes that our Lord taught that men should never use arms, whether in offense or defense by way of force, and that accordingly there should be no soldiers or police, no legislatures or courts, no locks or bars on our houses and no prisons—nothing but moral influence to restrain those who would assail our homes or our country. It is of no use to argue with a man who holds such views. He has an interior light, and he looks with lofty compassion on common men who would defend their property or their own lives and those of their families. We of the commoner breed, of ethic less angelic, ask, "Is life so dear or peace so sweet as to be purchased at the price of chains and slavery?"

But we do not admit that non-resistance, or anarchy—for they are the same thing in essence—is really a higher form of morals than is government by force, or self-protection; nor do we believe that it was taught by our Lord or his Apostles. The Christ who paid taxes, who told his Apostles to take a sword, who allowed Peter to carry one in the Garden of Gethesemane, thereby interpreted the Oriental language in which he commended the turning of the other cheek as better than rendering evil for evil. To make Christ the teacher of anarchy is to magnify the letter at the expense of the spirit of his teaching.

Nor is non-resistance any better in ethics. Not all fighting of evil can be figurative. Swords of faith must be sometimes supplemented by swords of steel. Liberty must not perish from the earth. Right is worth the trouble of holding. Why should the good yield to the force of the bad? Preach the doctrine of non-resistance if you will, and those whom you may convert are the gentler spirits, while the ruder, the violent, will flout it. Will Messieurs the murderers and housebreakers take the teaching? Let them be the first scholars, and then we can safely follow.

Of course, war is a terrible evil, and so is tyranny. Tolstoy was right in telling "that remarkably clever and progressive American, Mr. Bryan," that he had seen vastly worse wrongs from these evils than he had from private violence; but that does not prove that such wrongs, whether oppressive tyranny or aggressive war or personal violence, should not be resisted and stopped by force, instead of being allowed to run their vicious course. What rankles, and justly rankles, in Tolstoy's mind is the tyranny of the Russian Government, and he wants it to stop its aggressions; but he goes too far when he wants all government and all force to stop. Will he not by force pull back his wilful child that is running under a horse's heels?

But it is quite as much Tolstoy's misreading of American history to which we wish to call attention. Garrison was not the first to preach non-resistance; there was a multitude of Quakers before him. Nor did Garrison's preaching of non-resistance bear any vital relation to his challenge of slavery. He was a man of extremes, and attacked the general conditions of Church and State.

Nor was Garrison a specially great factor, as Tolstoy has gathered from his biographies, in the emancipation of the slave. It is a serious question whether, by his bitterness of language, his anarchic hostility to government, and his flouting of both Bible and Church, he did not do more to hinder than he did to help his cause. Certain it is that the cause was won by the men who voted, and not by his followers, who did not vote. It was the great army led, not by the "come-outers," as they were called, but by those who stayed in the Church and were active

in politics, men like John Quincy Adams, John P. Hale, Joshua R. Giddings—men who organized the Liberty Party, and saw it grow into the Free-Soil Party, which was the parent of the Republican Party, and carried the country for freedom and Abraham Lincoln, while Garrison and his followers bushwhacked and shouted outside the lines. Garrison was a man of a noble purpose and in many respects of a beautiful character, which mellowed as his great cause was achieved by other hands and consecrated in blood by the nation whose Constitution he called "a covenant with Death and an agreement with Hell," and whose franchise he refused to accept. His was a sweet old age which forgot the animosities and acrimonies of his middle years, and was crowned with peaceful honor; but it is a reversal of history to give him any supreme credit for the sentiment and influence which accomplished the abolition of slavery.

Curious Effect of the Railway Trust Decision

IMPORTANT proceedings with respect to the execution of the decree have followed the recent decision of the Supreme Court concerning the Northern Securities railway merger. Thirty-five thousand miles of railway, carrying more than two billions of stock and bonds, are involved in the contest before the Federal Court at St. Paul, where brief arguments were made last week by eminent counsel. Whatever shall be the approved plan of distributing the Northern Securities Company's holdings, the purpose of the Government's suit may be defeated, if that purpose was to prevent a suppression of competition between parallel transcontinental roads. The situation is one of great interest to those who are considering the recent concentration of railway ownership in this country, which possesses two-fifths of the world's railway mileage.

It will be remembered that the Hill-Morgan interests, having obtained control of the parallel Great Northern and Northern Pacific roads, which extend from St. Paul and Lake Superior to the Pacific, and naturally are competing lines, excited the hostility of the Harriman interests (Union Pacific and Southern Pacific) by getting possession of the Burlington system, that reaches out westward from Chicago and parallels the Union Pacific in Kansas and Nebraska. In the great financial battle of May, 1901, the Harriman interests bought a little more than half of the Northern Pacific stock, thus undermining the structure of the associated capitalists in the Northwest. In the settlement of that quarrel Mr. Harriman put this majority of the Northern Pacific shares, $78,000,000, into the Northern Securities holding company. He and his associates now demand that it shall be restored to them in the distribution of the company's assets. But the Hill-Morgan interests have undertaken to make the distribution in another way, giving to Mr. Harriman upon a *pro rata* basis for each share of Northern Pacific that he deposited $39 par value of Northern Pacific and $30 par value of Great Northern. Against such a distribution Mr. Harriman enters a protest. It would give him only a minority interest in each of the northern roads, and indirectly a much smaller interest in the Burlington.

If Mr. Harriman should recover the $78,000,000 majority interest in the Northern Pacific, he would then control not only that road but also the Burlington, which he especially desires to control. Three of the five great parallel roads between the Mississippi and the Pacific—the Southern Pacific, the Union Pacific and the Northern Pacific—together with the Burlington, would then be in the hands of the Harriman capitalists. If the purpose of the Government was to prevent a suppression of the natural competition of parallel transcontinental lines, it would be defeated by such a combination, which would be more powerful and comprehensive than the one attacked in the merger suit. The Great Northern would soon be taken into the alliance, for Mr. Hill now promises to sell out if the *pro rata* plan of distribution shall be upset. There would be no independent line between the Pacific Ocean and the Mississippi River except the Atchison, and control of that line by the great combination could not long be prevented. Thus we should see what Mr. Harriman proposed to Mr. Hill, as the latter now says, when the Northern Securities settlement was planned—a railway combination supreme throughout the

great tract bounded by the Pacific and the Mississippi, the Canadian line and the Gulf of Mexico.

Such would be the result of the distribution for which Mr. Harriman and his counsel contend; and we do not say that he ought not in justice to receive back the $78,000,000 of Northern Pacific stock. The question may be the subject of litigation extending beyond the decision of the court upon the pending petition. But if the distribution should be made in accordance with his plea, the Government's suit would have indirectly caused a more powerful combination of parallel roads than the one it sought to dissolve.

On the other hand, the *pro rata* distribution planned by the Hill-Morgan interests would probably in effect perpetuate that alliance of the Great Northern and Northern Pacific parallels at which the suit was aimed, and would do this by methods which the Supreme Court (as seems to be indicated by passages in Mr. Justice Brewer's recent opinion) might find to be permitted by the statute. It is denied that such would be the effect of the *pro rata* distribution. But we must be allowed to think that after such a distribution the two northwestern parallels would practically be subject to the same common control that was exercised before resort was made to the device of a holding company. Thus again the purpose of the Government's suit would be defeated, if that purpose was not merely to outlaw this device but to prevent a suppression of competition between the two long parallels.

We have considered the probable concentration of interests west of the Mississippi. Further consolidation and additional alliances, involving lines east of that river, are predicted in a statement recently given to the press by Mr. Hill, and are suggested by the extensive railway interests of great capitalists associated with Mr. Harriman.

The Sherman Anti-Trust law was not aimed at railroads. We do not believe that attempts to enforce it against railroad combinations will prevent those railway alliances by which the competition of parallel lines is suppressed, and which have tended during the last few years with increasing force to place all the railways of the United States in the hands or under the control of a few men.

But the power of Congress over interstate transportation is supreme and plenary. If complete consolidation cannot be prevented, the railroad companies can be compelled by Congress to deal fairly with the public. In just supervision, in the prevention of all discrimination, and in the determination or regulation of rates by Federal authority there are remedies for many of the evils attending such a consolidation as appears to be approaching. These remedies can be applied only by means of additional legislation and a Commission of ample authority. The alternative will be Government ownership and operation. Those who desire to avoid that solution of the problem should strive to perfect the legislation and the executive agencies by which alone the existence of complete railroad monopoly under the control of a few capitalists can be made acceptable to the American public.

Misconception of Municipal Management

THE exasperating experience of the New York public under the "near side" ordinance, which has compelled surface cars to make their stops before, instead of after, crossing a street, has moved the usually sensible *New York Times* to set forth an argument against the municipal management of such public utilities as street railways which can be characterized only as queer.

This ordinance was opposed by the Metropolitan Street Railway Company, and especially by its President, Mr. Vreeland; but it was forced through by a lot of Aldermen whose names do not command respect on grounds of intelligence or civic disinterestedness. The *Times* therefore argues that we have in this municipal regulation, which has now been repealed, a "lesson" of value. "This is just the sort of thing," the *Times* says, "that would be happening all the time under municipal operation of street railways." The private corporation, it is urged,

"has a certain continuity of purpose and policy," while "it is only in theory that municipal policy is continuous," and "there is in our political system no guarantee that with every

change, at every election, we may not invest with power a lot of men of great mental curiosity and impressed with the habit of indefatigable innovation, who if they had a street railway in their hands, would insist upon applying in the operation of it all the new ideas they could get adopted."

This argument has the inconclusiveness of *à priori* speculation. It will not endure the test of appeal to experience. In his thoughtful book on "Popular Government" Sir Henry Sumner Maine drew attention to the widely accepted fallacy that democracies are instinctively radical. The really serious danger in democracy, as Maine pointed out, is unprogressiveness, and our memory is greatly at fault if the *Times,* along with other apologists for the privileges of private corporations, has not more than once declared that private managers of railways are more alert to adopt improvements in both mechanical invention and in business policy than the railroad-operating governments of Europe are.

Looking more closely at the facts, does it appear that private corporations have shown any continuity of policy in managing public utilities, except in a certain obstinacy of denial of public right and convenience, or that, national, State and municipal governments have been relatively vacillating in their conduct of business affairs? We think not.

Has there ever been anything in the whole long history of modern business more uncertain and exasperating than freight and passenger tariffs were in the years that immediately preceded the invention of pooling? No man could tell a month in advance whether a ticket from New York to Chicago would cost him $2 or $20, and as for freight rates and routes, their name was anarchy. That a degree of order was brought out of the confusion we have Congressional legislation and the Interstate Commerce Commission to thank. To add to this major illlustration a minor one, not insignificant, we have in mind the operation of a certain branch line of a great Eastern railway system which is important because of a connection that it makes with a Western system. Within the past fifteen years there have been almost annual changes of the most radical character in the time table of this branch, every one of them disregardful of the convenience of the traveling public, and having no other cause than the "bad blood" existing between the two connecting systems.

The obstinate persistence of private corporations enjoying public franchises in a wanton disregard of the public interest, and even of human life, was shown in the refusal of the railroads to abandon the car stove until Governmental compulsion was brought to bear. It was by Governmental compulsion that the frightful loss of life by the link and pin couplings of freight cars was diminished. It is by Governmental compulsion that in a few commonwealths grade crossings are being abolished.

Turning to Governmental management, can anything even approximately as vacillating in respect of improvements, or as obstinate in the perpetration of abuses as the examples just cited, be alleged of the Government management of the Post Office, far from perfect as it is; in the State control of public education, far from ideal as that is, or in the municipal care of highways and public parks, defective as that also is? What private corporation, enjoying a public franchise in New York City, has shown anything approaching the continuity of policy which has made the Central Park and the Riverside Park sources of perpetual delight to the people of this city? When have the telegraph or telephone companies shown any such persistence of desire to improve their service as the authorities have shown in compelling them to take their unsightly poles out of the public streets?

The simple truth about this whole matter is that the average man still grotesquely overestimates the excellencies of private corporation activity, and inexcusably neglects to inform himself upon what has already been accomplished by public management and control.

The Destruction of the "Petropaulovsk"

Admiral Togo tells us—and soldiers always tell the truth in war-times—that the "Petropaulovsk" was sunk by a mine sunk by the Japanese. Three Russian war ships, the "Yenesei," mine placer; the "Boyarin," cruiser, and now the "Petropaulovsk," battle ship, have so far been reported from St. Petersburg

as accidentally destroyed by running on "harbor mines" at Port Arthur. It is hard to believe it. It is even hard to believe Admiral Togo's report that he laid a mine which has destroyed the "Petropavlovsk," killed Admiral Makaroff and all his staff and seven hundred men, and sent Prince Cyril back wounded to Constantinople. The indications, but for Admiral Togo's claim, would have led us to believe that the Japanese have submarines and are effectively using them. It has seemed to us from the beginning altogether unlikely that a navy so completely equipped with every other modern improvement should be destitute of the particular weapon which for the last five years has been more critically studied than any other, and which has already been adopted by England, France and the United States. There is nothing occult or mysterious about the existing types of submarine—nor anything difficult about their construction. The drawings of them have been freely published in the technical newspapers and the Japanese have ample facilities for building them. In fact, there seems no more reason for assuming their inability to build submarines than ordinary surface torpedo boats, and they are certainly producing the latter.

There would be the minimum of trouble in physically concealing an underwater craft, and the Japanese have already shown themselves adepts in keeping their own counsel. The only contrary circumstance is the fact that the Russian ships have not been destroyed at their moorings in Port Arthur by submarines sent in for the purpose. On the other hand, it may well be that the war found the Japanese, like ourselves, still experimenting and so in possession of only a limited number—rumor says four—of these boats. In such case, they naturally would take no undue risks with them.

Admiral Togo's nerve-racking descents on Port Arthur begin to look like specious invitations to the Russians to come out into blue water and be blown up. The torpedo which destroyed the "Petropavlovsk" was entirely too well placed to suggest mere accidental contact with a stray mine. The ship was under way, and would have struck such a mine bow on. The resulting explosion from the concussion might have torn her bow off, but not necessarily have sunk her, if her compartment bulkheads held. At all events, ships while going ahead do not run on harbor mines sidewise—nor necessarily get so badly hurt as to "turn turtle" immediately. Yet we are told, and it may be true, that a mine was skilfully placed on the probable course of the enemy's ships, and that its explosion was followed by the explosion of the battle ship's magazine.

Baptist and Congregational Church Union

We print this week Dr. Norman Fox's article by way of comment on Dr. Bradford's proposal for the union of Baptists and Congregationalists. With Dr. Fox's criticisms of Dr. Bradford's scheme of union we have no particular concern; they are addressed not so much to the great religious public as to the Baptists themselves, and are a defense of the Baptist position. We only say that if it be true, as Dr. Fox says, and we believe it is, that Congregationalists and Pedobaptists generally have given up the theory of baptismal regeneration, and no longer put sacramental value on the rite, then it is no longer necessary to protest against the rite of infant baptism on the ground that it represents a doctrine long discarded. It is no more in place now to protest against infant regeneration than it is against infant damnation. Both have passed with the old theology. With most Protestant bodies infant baptism means no more than a form of solemn consecration of the child and the promise to bring it up in a religious way.

It is perfectly indifferent to us what the basis may be, so long as it violates conscientious convictions on neither side, and allows liberty of doctrine and practice. We need to keep this in mind—that liberty to differ is the true condition of peace in union. If some people wish to immerse and others to sprinkle, let them have their choice. If some wish to consecrate infants and call it baptism, while others prefer to give their children to the Lord without any water ceremony, let them do it. If some ministers have a be-

lief that it is wrong for them to baptize infants, then let them desist and let some other minister perform the ceremony when required.

But the point in Dr. Fox's article is not, and is not meant to be, in his polemic with Dr. Bradford. It is rather in the briefer conclusion of his article in which he proposes what appears to him a better and more hopeful way of securing the same end—namely, a union between Baptists and Congregationalists. Where Dr. Bradford proposed a laxity of teaching as to the sacraments, Dr. Fox proposes that the two sacraments shall be quite disconnected in administration, so that baptism shall not be made a prerequisite to the Lord's Supper. If the invitation to the Lord's Supper is given to all who love our Lord, baptized or non-baptized, then it is no concern to the Baptists whether Congregationalists were baptized by affusion or immersion, or whether they were baptized as adults or in infancy. The questions which Dr. Bradford raised may be ignored, and individuals may be as strict or as loose as to baptism as they choose. This solution is a perfectly good and reasonable one. It is a growing habit in the churches to invite to the communion table all those who love their Lord, with no reference to their "good and regular standing."

In some way these two denominations ought to come much nearer together. Already, in the North, the close communionism of a generation ago is passed away. Baptist papers would admit no such discussions as burdened the pages of *The Examiner* in the days of Dr. Bright. Intercommunion is a common thing. Baptists and Congregationalists have the same polity, and they differ only in unimportant ritual customs. The passing of ministers and members from one denomination to the other ought to be easy, altho this means that Baptist ministers taking Congregational pulpits ought to be at liberty to decline, as well as consent, to perform ceremonies to which they have had conscientious objection. The time ought not to be far distant when the relations between the two denominations shall be as close as they are in England, or even closer. We trust that the object desired by Dr. Bradford and Dr. Fox may before long be achieved. Denominational union is moving fast in these days. It can hardly come too soon. The Church longs for it, and is tired of its divisions.

Colonies and Disease

In a late issue of *The Medical News* of New York, under the title "The Typhoid Cost of the Philippines," attention is called editorially to the epidemics of various diseases which have occurred since the Spanish-American War and the acquisition of the Philippines, with the idea of showing the connection between these diseases and the exposure of soldiers in tropical foreign climates to infections of many kinds. The war itself was followed by a series of epidemics of smallpox, widespread throughout the country, causing great uneasiness and disturbance of business and leading to serious anxiety with regard to the efficacy of our sanitary precautions generally. There is no doubt now in the minds of the medical profession of this country that this epidemic of smallpox was due to a number of foci of the disease, established by home-coming soldiers after their campaign in Cuba and Porto Rico. Fortunately, prompt and efficient measures in the application of vaccination have done much to limit the ravages of the disease, and tho it still exists in many more places throughout the United States than before the war, sanitary officials generally have the confidence that they have the disease under control.

During the last three or four years there has been a series of epidemics of typhoid fever in many places throughout the country where this disease was not a source of disquietude before. A number of university towns have suffered from the ravages of the disease, and the report of its successive invasion has been followed by considerable uneasiness on the part of university authorities generally. No good reason has been found up to the present time for this recrudescence of a disease which sanitarians generally were beginning to think was being brought under control and would gradually disappear. It seems probable to the editorial writer in the *Medical News* that these new scattered foci of the disease must be attributed to discharged soldiers returning from the Philippines.

As is well known, the disease was not infrequent among the soldiers on duty there. One of the most striking facts in sanitary science that have been recently brought to light is that the typhoid fever bacillus may remain for a long time alive in the excretions of patients who have recovered from an attack of typhoid fever. They have been demonstrated a number of times in the urine of convalescents from typhoid three months after convalescence had been established. It is now generally recognized that the typhoid bacilli may lurk in certain parts of the system even for many years after an attack has passed off. For instance, they have been found in pure culture—that is, with no other bacilli present—in an abscess in bone in a person who had suffered from typhoid fever nine years before. In this case the immunity produced by an attack of the disease kept the bacilli from proving virulent for the tissues in which they were until, in the course of time, the acquired protection wore off and then some injury to the bone gave them an opportunity to exercise their pathological qualities once more and produce what is known as typhoid osteomyelitis.

This, however, is an extremely rare condition and cannot be considered a prominent factor in the sanitary problem. It is very important, however, that for several months after recovery from typhoid fever the excretions of typhoid patients should by no chance have the opportunity to get into the water supply of any town. This seems to require no special insistence since, as is evident, no excretion should ever by any possibility get into a water supply. It is well recognized now, however, that typhoid fever begins anew only as the result of inoculation from a previous case and that such inoculation occurs, disgusting as is the thought, only by means of excretory material. Returning soldiers scattered over many parts of the country within a short time after their discharge have been the unconscious source of numbers of cases of disease. It would seem, then, that to the cost of the Philippines in life and treasure as so far calculated we shall have to add many deaths from contagion at home. "War is hell" not only during its continuance, but the aftermath of war is, as has only too often been proved, likely to bring with it many elements of disease sure to prove dangerous even for those who were not actually engaged in warfare.

It is evident, then, that even more careful sanitary precautions will have to be insisted on than have been hitherto deemed necessary. The editorial writer in the *Medical News* suggests that soldiers should not be discharged from the Philippines and then allowed to return directly to their homes, but that their transfer to America should be made some two or three months before the time of their discharge in order to be sure that their exposure to infectious diseases in foreign climates may not prove a source of disease distribution here at home. After all, it must not be forgotten that some cases of typhoid fever, as the editor remarks, are so mild and the abortive form at least of so short duration that its occurrence might pass unnoticed in a tropical climate, where there are many unusual conditions causing slight fevers.

Ecclesiastical Disturbance in the Philippines

THAT the purchase of the estates of the friars has not in itself settled the religious controversy in the Philippines is proved by the later news which comes from the islands. The Government has done what it could to that end; it now remains for the new American bishops to do their part. Yet here is what Bishop Rooker is reported to have said in a public address almost immediately after arriving at Iloilo, to assume charge of the diocese of Jaro:

"The fact that so small a number relatively of the faithful attended the pontifical mass with which the feast-day of the Patroness of the diocese was celebrated, besides being the first mass attended by me in the capital of this diocese, was a revelation of the existence of an anti-religious feeling, insidious and base; which must be combatted. . . .

"There has never been recorded in the history of the persecutions suffered by the Church, not even going back to those which the Protestants carried on in past centuries, one which revealed more plainly the character of baseness and treason than that to-day suffered by the Catholic Church in the Philippines—a persecution initiated and sustained in each town by

four or five half-instructed persons, who have illy digested an incomplete education and who seek to impose their ideas as if they were those of the entire country."

This is precisely the position assumed by the friars, that only a few agitators have organized and sustain the fight against them, and that the mass of the people revere and love them and wish them to return to their parishes. Is it to be wondered at, then, that the critics of the Pope's bull of last year, who prophesied that the new friar-coadjutors of the American bishops would dominate them, are pointing to Bishop Rooker's address as a vindication of their position? The situation in the Jaro diocese needed, above all, tactful handling. The Aglipay schism had made considerable headway, but the main body of the revolting clergy in that diocese had halted half way, refusing to join hands fully with the schismatics, declaring themselves still obedient to Rome in matters of dogma, tho refusing obedience in matters of discipline unless they were to be freed under the new *régime* of all friar domination of any sort whatsoever. With the coming of the new bishop the organization of the new propaganda of opposition was for the time being suspended, under the publicly announced desire of the main body of the native clergy and their followers (who number a majority of the native families of influence in Panay) to wait and see what the policy of the new prelate would be.

One of the first steps of the new bishop was to proceed with lawyers and others to take possession of several large churches near Iloilo which have been held by the schismatics. This matter of the possession of the village churches was, it will be remembered, the very first cause of disorder in 1902, when the followers of Aglipay set up the old Filipino contention that these churches are the property of the people because built by their labor and contributions and upon land belonging either to the Crown of Spain (hence transferred to the Government of the United States in trust for the Filipino people) or upon the commons belonging to the various municipalities. When the riots began at Pandacan and elsewhere, threatening another religious war, Governor Taft intervened sternly to restrain the seizure by force of churches hitherto peacefully in the possession of friars or other priests remaining loyal to Rome. He eventually established a *modus vivendi* based on the proposition that all such disputes must be referred to the courts for settlement in a lawful manner; thenceforth, all local officers throughout the archipelago were instructed to recognize actual possession in a peaceful manner, no matter by which party it was had. That is, if a priest and his congregation had gone over to the schism, the Catholic authorities were required to institute legal proceedings to establish the validity of their title to the property. If the church in a given village remained in the possession of a priest of Rome, whether friar or other, the schismatics were strictly enjoined to make no attempts to dispossess him by force of numbers, but to hold their meetings elsewhere and to begin suit if they so desired. In a country where separation of Church and State is still but dimly understood it was hard to keep many presidents of towns from meddling in these controversies and employing the police under them for the purpose; but the popular confidence in Governor Taft finally led to peaceful compliance, and the threatened disorders were averted. If the reports from Iloilo are correct, Bishop Rooker has himself invited a resumption of the scenes of disorder.

There is no indication that he resorted to any violence at all, simply going to the churches during week-day hours, when there was no one inside to prevent his action, taking possession quietly with his lawyers, leaving persons on guard and posting notices of warning against trespass.

Stories have been sent from North Ilocos, however, that Bishop Dougherty, the new American bishop in charge of the diocese of Nueva Segovia, has had recourse to some little force in order to take possession of the parish churches in Badok and San Nicolas, or at least that he, with his supporters, had forced their way into the churches in question in the face of the personal protests of the schismatic priests, formerly recognized as in peaceful possession of them. At Badok stones were thrown at the bishop, and he tore in pieces in the street an in-

junction served upon him from the local justice forbidding him to seize the church. North Ilocos is the home of Aglipay, and has been from the first head and center of the revolt. It need not be pointed out that this sort of action threatens trouble, not only for the American bishops themselves, but for their Government. At least it will require the Commission, through the courts, to restore the churches thus seized.

There has been a tendency all over the Islands for the natives now reconciled to American rule, temporary if not permanent, to suspend judgment, and operations as well, on the friar matter, till it could be seen what should be the attitude and policy of the new American prelates. The Federal Party organ of Manila, *La Democracia,* dropped the discussion of the friar question almost entirely for three months, declaring its faith that under the new prelates the old *régime* of medievalism and despotism would entirely come to an end. But *La Democracia* now says:

"The Filipino people, which now has a full perception of how far the friars dare go, *will defend itself in one way or another, and will take care to make its rights respected,* certain that to-day it is under a free and honorable government, and that *there is no power on earth that dares impose the frair-priests on the Filipino parishes.*"

One of the sharpest critics of the Pope's bull, on the ground solely that it was based on a misunderstanding of conditions in the islands, owing to friar influences at Rome, is an ex-member of the Augustinian order, Padre Salvador Pons, who at his own request secured his release from the order at Rome over five years ago, but who still retains his connection with the Church. He has had great influence among the native clergy as a vigorous assailant of monasticism and defender of the recognition by Rome of the Filipino priests; indeed, his influence during the past year has played no small part in keeping a large body of Ilocano and Visayan clergy outside of the ranks of the schism, and it was on his advice that the Panay clergy made their movement of revolt only on the question of discipline and not of dogma. He is greatly disturbed by the resolutions adopted at a Catholic Congress in Atlantic City supporting the friars, and calls them "libelous and calumnious," it being affirmed that with the withdrawal of the friars some "six millions of Filipino Catholics were left practically without ministers of religion."

"Never was there such an instance of annulment and negation of the rights, and refusal to recognize the public services to religion, of six hundred Catholic priests, as that which has just been carried out in the most tranquil fashion by the bishops and clergy of the United States at Atlantic City."

Further insight into the character of the contest now being waged in the Philippines is afforded by a little pamphlet issued in Manila on December 8th, the day of Our Lady of the Immaculate Conception, once recognized as the patron saint of the Philippine Archipelago. It is entitled "Solemn Detestation of the Principal Errors and Heresies of Our Age," and copies of it were handed out at the doors of all the convents of Manila on the day in question, the five hundredth anniversary of the proclamation of the dogma of the Immaculate Conception. By authority of Apostolic Delegate Guidi generous indulgences are given to all who recite it. Here are some of its paragraphs:

"I detest and reprove the secularization of education, and I say that the civil authority cannot arrogate to itself the control and discipline of studies, and with the same energy I reprove and detest lay and purely scientific education. . . .

"I detest and reprove popular sovereignty, universal suffrage and the system of majorities." . . .

Detestations are also pronounced on the liberty of worship, the liberty of the press, the liberty of teaching, the liberty of conscience, the principle of tolerance and all the formulas of liberalism. After all these mouthings of detestation, the pamphlet finds place at last to "bless and praise the Most Holy Tribunal of the Faith."

Is it not perfectly plain where the issue is joined in the Philippines, and what are the parties the new American prelates are called upon to choose between? But what do the Catholics of the United States, who have been so sure of their information about the Philippine situation, think of the above?

Zarathustra and Buddha

In America so much is new that we think all things are, and every resurrected and revived mystical or ethical idea is heralded as a new religion. In Germany the historical sense is strong, and accordingly strange doctrines have to claim ancient lineage before they get any standing in the community.. This is one reason why the battles between the two antagonistic ethical theories of self-assertion and self-renunciation has been fought under the ancient banners of Zoroastrianism and Buddhism. In these pages we have merely been discussing the modern rival prophets, Nietzsche and Schopenhauer, and it is only necessary here to speak briefly of their ancient prototypes in order to understand why their names should have been chosen.

Whatever may be the causes of the alarming prevalence of modern pessimism in actual life, as shown by many serious symptoms, such as the increase of suicides, there is no doubt that philosophical pessimism had its origin largely in the Oriental studies of the first half of the last century. It has been found in Italy that an epidemic of malaria follows excavation in the ruins of ancient Rome, and it seems that the resurrection of ancient religions spreads a moral pestilence in much the same way. Buddha was not the first pessimist, nor was he the most extreme of ascetics; but we find in the sacred books of Buddhism a thoroughgoing exposition of a philosophy of pessimism and of the reasons for renunciation and asceticism. The gospel of Buddha aimed to show the way of escape, not from the evils of life, but from the evil of living. The method and discipline imposed by Buddha on his disciples consisted essentially in learning by constant practice to look on the seamy side of life.

A favorite story is that of the monk who sat begging by the wayside, when a gay and beautiful woman in attractive attire passed by. The recluse almost succumbed to a feeling of pleasure at the sight, but as she smiled he saw her teeth, which reminded him of the skeleton so charmingly guised, and he realized that the bewitching vision was merely "a rag, a bone and a hank of hair" after all. "So thinking on impurity, he attained to holiness" is the customary close of these apologues. It is not necessary to point out that this is the opposite of the Christian method of attaining holiness by thinking on "whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good repute."

But if Schopenhauer could base his pessimistic philosophy on Buddhism, what right had Nietzsche to connect his hedonistic ethics with Zoroastrianism? This is a point which has received too little attention. It has been called pure fantasy on the part of Nietzsche to select the name of Zarathustra as the champion of good living against asceticism, and it is stated by some of his commentators that the Zarathustra of Nietzsche has no resemblance to his ancient namesake.

But Nietzsche has more method in his madness than he is popularly credited with, and that he has a right to use the words "so spake Zarathustra" for some of his rhapsodies as the following quotation from the Zend-avesta shows:

> "Verily I say unto thee, O Spitama Zarathustra, the man who has a wife is far above him who lives in continence; he who keeps a house is far above him who has none; he who has children is far above the childless man; . . . and of two men, he who fills himself with meat receives in him Vohu Manô [the god of good thoughts] much better than he who does not do so."

In India to-day the two ethics are in conflict and their practical workings can be compared. The Parsees are only a small group in a multitude of sectaries, nominally Brahmanic, but agreeing in little save in the belief that the ideal life is ascetic, yet in wealth, education and influence in the community the Parsees stand superior to their neighbors. Parseeism, like Judaism, tends to develop especially those virtues which have economic value, the morality of thrift, industry, benevolence, family life and the like; so the followers of Zarathustra have in India somewhat the same position the Jews have in Russia. They live only in the cities, following mercantile and financial pursuits, and while they are eager to acquire the language and learning of the English, they remain as a people unassimilated and essentially unaffected by their contact with other races. In freedom from asceticism and fanati-

cism they offer a striking contrast to the Hindoos. As one of their writers says: "Others fast from bread; we fast from sin."

Municipal Photographers

Photography, long a successful adjunct of the criminologist, is to be made to serve a similar part for the municipal administrator. Philadelphia is to have an official photographer, whose main duty it will be to take the photographs of the condition of property before and after work upon it or in the near vicinity has been commenced. Contractor John B. MacDonald went over the whole route of the New York Subway with his subcontractors and had photographs made of every site where it was intended to excavate. In this way he secured for preservation and future use indisputable evidence as to the actual conditions of affairs. Now Philadelphia proposes to do this thing officially, and make an official record of all public work. It has already been demonstrated that large sums of money can be saved to the city, both in the way of defeating unjust claims of property owners for damages, and in the way of disclosing failures to comply with the terms and specifications of contracts. Moreover, official photographs will be made of all public works and buildings to be filed away for historical purposes. Several years ago, when Independence Hall, in Philadelphia, was being restored, no one could find a print to show how it looked a hundred years ago. The official photographer will supply the records by which future restorers can do their work expeditiously and accurately. Thus Philadelphia is but following in the footsteps of the executive departments at Washington, every one of which has its official photographer, whose work consists in preparing illustrations, preserving records and reproducing all sorts of data. Photography is also being used in the perpetuation of Government records, and the thousands and tens of thousands of State papers are to be photographed and a comprehensive index of the negatives made so that one of a required document can speedily be developed when needed. In this way records which now consume cubic yards of valuable space will be preserved in cubic inches.

The Repudiating States

The nasty skeleton of repudiation is dragged from our national closet by the decision of the Supreme Court, which gives to the State of South Dakota a judgment against the State of North Carolina for $27,400, and orders that if the defendant State does not pay by the first Monday in January, 1905, she shall be treated like the humblest bad debtor—certain property of hers shall be seized and sold at the east front door of the Capitol Building in Washington. Doubtless this decree will start again the flood of angry reproach and tart retort between Northern investors and Southern repudiators, which was so common twenty or thirty years ago. Eleven of the Southern States have borrowed at various times sums which now amount, with the accrued interest, to about seven hundred million dollars; this debt they have wiped from their books by the simple process of refusing to pay. The excuses for this act were various. One Governor of Mississippi said in his indignation that the bonds had fallen into the hands of Rothschild:

> "In his veins flows the blood of Judas and of Shylock. . . . He has advanced money to the Sublime Porte, and taken as security a mortgage upon the holy city of Jerusalem and the sepulchre of our Savior. . . . It is for the people to say whether this man shall have a mortgage upon our cotton fields and make serfs of our children."

The reason the bondholders cannot recover lies, of course, in the Constitutional provision that an individual cannot sue a State, while one State can sue another. The individual bondholders have tried at various times to employ some State as an agent to collect for them, but this device has always failed in the Supreme Court until the present case. Here the original owner of the bonds made a full and free donation of them to South Dakota, suggesting that the latter State, if able to collect, use the money for its public schools or asylums, and hinting that if South Dakota should succeed, more gifts might follow. South Dakota did succeed and the whole issue of repudiation is now to the front. Of

course, the individual owner in the present case gets nothing; and it is further to be borne in mind that these bonds are of many issues, with varying conditions, and that the present decision is a binding precedent only for such bonds as have identical conditions.

Death of Verestchagin

The greatest misfortune of the Eastern war thus far is the death of Verestchagin. Beyond question he was the greatest artist that Russia has yet produced. He had painted scenes of battles on land, always with a view to teaching the horrors of war, and it was his desire to paint a naval battle. It was this desire that made him accept the invitation of his old friend, Admiral Makaroff, to be his guest on the "Petropaulovsk," and he went down with the vessel and its more than seven hundred victims, himself a victim of the system he hated and painted. His technic was questioned by the critics, but his great canvases were extremely effective, giving the most realistic representations of scenes of Russian life and of the ghastly work of war. We recall his picture of the blowing up of prisoners from the British guns in India, and another later composition showing Colonel Roosevelt leading his Rough Riders up the hill at San Juan. We shall insist on putting the men of peace before the men of war, Verestchagin before Makaroff, and count his death as the saddest loss of those terrible two minutes when twice four hundred men went down.

It is an admirable plan that the Intercollegiate Branch of the Young Men's Christian Association has started by attaching the multitude of young college graduates, a thousand of whom come every year to this city. This branch, called the Students' Club, writes to the Y. M. C. A. in each college and gets from them a card catalog of students coming to New York, with their home and city addresses, their church preferences and their fitness for special religious work. These names, when received, are distributed to committees in churches, settlements, etc., which look the men up, and introduce them into the religious life of the city. In this first year definite information has thus been received of 178 men, of whom 80 are church members, 72 in regular attendance in churches, and 34 in active, religious or philanthropic work. This is a hopeful beginning of a good work.

It is a grand result of the large bequest of Mr. Rogers to the Metropolitan Museum that it is able to compete with the European museums in the purchase of very expensive objects of art. We have already spoken of the late acquisition of a splendid complete votive chariot of the Etruscan period, of full size and beautifully ornamented; also of frescoes from a house lately opened at Pompeii, which now make a room at the Museum. The Museum has just acquired, for $400,000, a famous collection of arms and armor, made by the Duke de Dino, which includes the best specimens that could be purchased during the last thirty years. We must congratulate the Director, General di Cesnola, and the trustees on their successful enterprise.

Andrew Carnegie spends his time in trying to find plans for spending his surplus wealth for the benefit of the world. His last gift is of $5,000,000 as a fund for the reward and relief of "those following peaceful vocations"—for Mr. Carnegie is no lover of war—who have been injured in heroic effort to save human life. It will be for such a sort of accident insurance company, supporting them until again able to work, or, if they lose their lives, providing for their widows and children. This applies to the United States and Canada. It is a splendid provision for a splendid kind of self-sacrifice; but there are men, and women enough who are heroes of peace, we believe, to keep the commission busy which will be in charge of this fund.

Last Saturday 127 immigrants were deported for the crime of having made sure of work here before they sailed from Europe. Six of them were cutlers, who had been at work almost a year before their crime was discovered. It is a queer law which gives the preference to men who don't know whether they will find employment. Those 127 men are all presumably of the most desirable class.

Insurance

Weddings and Burglary Insurance

THE introduction of a representative of some detective agency to guard the wedding presents displayed has come to be quite customary. The need for such a guest is a sad commentary upon the conditions that we all know are now prevailing in modern society. In spite of the precautions named, however, it frequently happens that something is found missing. The detective agency, while it exercises the utmost vigilance, assumes no responsibility for losses due to theft. When wedding presents are displayed there is always a hazard, to cover which burglary insurance has been devised. For a sum that is substantially equivalent to what it costs to have a guard present, who, with the best intentions, cannot in the very nature of things be argus-eyed, a burglary policy can be written.

Such a policy protects the holder not only for the evening of the wedding, but for a twelve months' thereafter against all loss through burglars, sneak thieves, dishonest guests or servants. In case anything is stolen the insuring company pays for it. A good company has also many facilities and great experience in locating stolen property, which is valuable in case the stolen articles have a sentimental value as heirlooms or otherwise. The burglary insurance company has numerous agents and emissaries, so that it has veritably a hundred eyes that are alert in discovering stolen wedding presents, wraps, coats, furs, etc. A policy insuring against burglary continues in force during the summer vacation period, when the insurer's home is frequently vacant; so that the expense of taking everything to the storage warehouse is saved. The provisions of the policy are such that losses by damage caused by burglary and vandalism are also covered. In view of these facts the superiority of the form of protection signified by burglary insurance over that of a detective agency will be apparent.

THE general statement that corporations have no souls does not seem to have been borne out in the case of the Mutual Life Insurance Company. When the Rev. John L. Gay wrote to them that the yellow fever epidemic was raging in Memphis and asked permission to work among the patients without vitiating his policy, the company telegraphed: "You have our permission, according to the tenor of your letter. Go, and God bless your efforts." The Rev. Mr. Gay went under that permission, did valliant work and returned safely. He died at the age of ninety-five, on March 26th, and the letter written to the company to which reference has here been made was found attached to his policy. It made an interesting exhibit.

Insurance. A Practical Exposition for the Student and Business Man. By T. E. Young, B.A., F.R.A.S. New York: Isaac Pitman & Sons. Price $2.50.

Almost every one realizes in a vague way that there is such a thing as insurance and that it is intended to cover losses by fire, by death, by burglary, by shipwreck and various other hazards. A great deal of misconception prevails, however, as to the principles governing the various forms of insurance, which it is the province of the present book to make clear. "Insurance" as now issued is designed to afford a perspicuous exposition, in an elementary form, of the underlying and governing principles, both as to theory and practice, upon which insurance administration is based and conducted.

There is a broad survey of the field, and the student and busy, practical man is helped to understand something about the numerical basis of assurance calculations, the nature of risks, the doctrine of probabilities upon which the fabric of insurance rests basically, the meaning and effect of selections as applied to life insurance, surrender values, the sources of profit and its distribution, the investments of a life office, the uses of life assurance to the business man, fire insurance, marine insurance, accident and casualty insurance, as well as much that will be luminous with the book that would be very obscure without it. The atmosphere of the volume is British, but the difference between British and American insurance is very slight. The book may be studied with much benefit by those interested in insurance.

Financial

A New Currency Bill

It is not expected that there will be any currency legislation at the present session of Congress. The bill reported last week by the House Committee on Banking and Currency, however, ought to be passed before adjournment. It repeals the law which prohibits the deposit of customs receipts in the banks. There was a good reason for this prohibition in 1864, when it was enacted, but there is none now. These receipts should not be locked up, but should be deposited daily, as internal revenue receipts are, and thus be available for commercial use. Under the present law the customs funds are withheld from such use in the greatest quantity just at the time when there is the most urgent demand for them in business; for the customs receipts are largest when imports are large, when consumption is at its highest point, and when great business activity creates an exceptional demand for currency. The proposed change has repeatedly been called for by the New York Chamber of Commerce. The bill also repeals the law which now restricts to $3,000,000 in any month the retirement of National Bank note circulation. This change ought to be made, to promote the elasticity of the circulation.

It is also provided in the bill that the present limit of the total amount of subsidiary silver coins in existence ($100,000,000) be removed, and that the amount may be increased from time to time as public necessity may demand. The silver bullion available for coinage will be exhausted in July next. Therefore the bill authorizes the recoinage of silver dollars on hand into smaller coins. There are 578,012,099 of these dollars, and on April 1st only 74,704,000 of them were in circulation as coin. It is true that the bulk of the stored dollars are in circulation by means of silver certificates, for which they serve as a basis; but a considerable number of them might well be recoined for enlarging the supply of subsidiary silver. It is suggested by the committee that a currency that is clean, in a sanitary sense, can best be obtained by substituting silver coin for all the one and two dollar bills, and by improved methods of redeeming bills of higher denominations. But the public, we think, would not willingly accept small silver pieces in place of all the ones and twos. Provision should be made for the frequent and prompt redemption and renewal of this paper money. That part of the bill which relates to the deposit of customs receipts ought surely to be enacted before the annual Fall demand for currency to move the crops.

Recent official reports show that the output of pig iron in Germany in 1903 was 10,085,634 long tons, against 8,402,660 in 1902. In this country the output of Bessemer steel was 8,577,228 tons, and 2,813,583 tons of rails were made.

....Charles H. Patterson, Cashier of the Fourth National Bank; Alonzo Burbank, Treasurer of the International Paper Company; Thomas F. Manville and William T. Brown, of A. G. Spalding & Brothers, have been made Directors of the Consolidated National Bank, of which Willis S. Paine is President.

....Frederick Worth, who became money teller in the Park Bank in 1872, receiving teller in 1874, and paying teller in 1876, resigned last week to become Vice-President of the New York National Exchange Bank, of which Lewis E. Pierson is President. The National Exchange has a capital of one million dollars and a surplus of three-quarters of a million dollars.

....John W. Castles was last week elected President of the Guaranty Trust Company. Mr. Castles is well known as the former President of the Hibernia Bank and Trust Company of New Orleans. George R. Turnbull and Oscar L. Gubelman remain as Vice-Presidents. The capital of the Guaranty Trust Company is two million dollars and the surplus five million dollars.

....Dividends announced:

Amer. Car & Foundry Co., Common, ½ per cent., payable May 2d.

Amer. Car & Foundry Co., Preferred, 1¾ per cent., payable May 2d.

Rock Island Co., Preferred, 1 per cent., payable May 2d.

The Independent

Vol. LVI NEW YORK, THURSDAY, APRIL 28, 1904 No. 2891

Survey of the World

Panama Canal Property Transferred

The United States now owns all the rights and property of the Panama Canal Company on the Isthmus. In Paris, on the 22d inst., just before the meeting of the company's stockholders, the contract of sale was signed by President Bo and Director Richman, representing the company, and by Assistant Attorney-Generals Day and Russell, for the United States. At the stockholders' meeting, on the following day, a resolution ratifying this sale was adopted. There were only five votes in the negative. The United States gets an unencumbered title. Payment of the purchase price, $40,000,000, will be made after the deeds have been approved by Attorney-General Knox. Commissioner Parsons has already returned from the Isthmus. His associates started for New York on the 20th. Mr. Parsons is confident that by procuring public supplies of good water for Colon and Panama, by providing sewerage systems, and by a vigorous enforcement of sanitary regulations, both of these cities can be made healthful places of residence. The death rate at Panama is about 60 per thousand. It is understood that there is much to be done before the work of construction upon a large scale can be undertaken. The greater part of the French company's plant has no value.—In Congress, the House, upon the unanimous report of its committee, and without a division, has substituted for the bill recently passed in the Senate (for the government of the canal zone) the exact words of the Act of 1803, by which absolute power to govern the territory of the Louisiana Purchase was vested in President Jefferson. This substitute provides that until the expiration of the Fifty-eighth Congress, "all the military, civil and judicial powers exercised by the existing Government of the territory granted by treaty shall be vested in such person or persons, and shall be exercised in such manner as the President of the United States shall direct." It is understood that this substitution was made at the suggestion of Mr. Roosevelt. It makes such a grant of power as was given to the President in the case of the Philippines. It may be displaced or modified at any time (as provided in the bill) by more specific legislation. The House thought that just what was needed could not be fully known at the beginning, but would be disclosed by the labors and reports of the Commission.

Judge Parker's Candidacy and Platform

At their State convention the Democrats of New York instructed their delegates to vote in the national convention for the nomination of Judge Parker. The unit rule was adopted. Instructions for any one were opposed by the Tammany forces, who asserted that they desired to support Judge Parker, but preferred that the delegates should be free in the convention. They offered a substitute resolution commending Judge Parker in very complimentary terms. This was rejected by a vote of 301 to 149, and the Parker instructions were then adopted without a division. The object of Tammany's opposition has not been Judge Parker, but ex-Senator Hill, whose influence, the Tammany leader thinks, would be exerted to the

injury of the present rulers of Tammany if the Judge should be elected. It is understood that Mr. Hill intended to give Tammany no delegate-at-large, and that it was due to the intervention of Judge Parker that the place to which August Belmont had been assigned was at almost the last moment offered to the Tammany leader, who would not take it for himself, but gave it to George Ehret, a prominent brewer. The brief platform consists of the following "declarations upon the national issues of the hour:"

"1. This is a government of laws, not of men; one law for Presidents, Cabinets and people; no usurpation, no executive encroachment upon the legislative or judicial departments.

"2. We must keep inviolate the pledges of our treaties; we must renew and reinvigorate within ourselves that respect for law and that love of liberty and of peace which the spirit of military domination tends inevitably to weaken and destroy.

"3. Unsteady national policies and a restless spirit of adventure engender alarms that check our commercial growth. Let us have peace, to the end that business confidence may be restored, and that our people may again in tranquillity enjoy the gains of their toil.

"4. Corporations chartered by the State must be subject to just regulation by the State in the interest of the people; taxation for public purposes only; no Government partnership with protected monopolies.

"5. Opposition to trusts and combinations that oppress the people and stifle healthy industrial competition.

"6. A check upon extravagance in public expenditures, that the burden of the people's taxes may be lightened.

"7. Reasonable revision of the tariff; needless duties upon imported raw materials weigh heavily upon the manufacturer, are a menace to the American wage earner, and, by increasing the cost of production, shut out our products from foreign markets.

"8. The maintenance of State rights and home rule; no centralization.

"9. Honesty in the public service; vigilance in the prevention of fraud, and firmness in the punishment of guilt when detected.

"10. The impartial maintenance of the rights of labor and of capital; no unequal discrimination; no abuse of the powers of law for favoritism or oppression."

These utterances have been commended by a considerable number of prominent Democrats of the South and West. They are denounced by Mr. Hearst's papers as a collection of "spineless truisms" designed to avoid giving offense to the Trusts. Mr. Bryan attacked them last Saturday night in Chicago, addressing a large audience in a hall hired by himself. The platform, he said, was a dishonest one, fit only for a dishonest party. No one but an artful dodger would consent to stand on it. Because it was prepared by Judge Parker's friends and must have been approved by him, therefore Judge Parker was not fit to be nominated by any party that stood for honesty in politics.—The Democrats of Pennsylvania declined to instruct their delegates, but it is believed that the vote of the State will be cast in convention for Parker. In the Massachusetts convention, the followers of Hearst were outvoted by nearly 3 to 1, and the delegates were instructed to vote for Olney. In West Virginia, the Democrats gave no instructions, but a large majority of the delegates are for Gorman, with Parker for second choice. A motion to instruct for Hearst was defeated in the Oregon convention, but this candidate will probably control the Iowa convention, and is making some progress in Indiana and Illinois. Notice is given that the Populist convention will be held at St. Louis two days before the convention of the Democrats. The conservative element in the Democratic party would prefer that it be held elsewhere and at a later date.

The Trust Question

At a meeting of the House Committee on the Judiciary last week the Democratic members caught the Republicans napping and procured a vote of 7 to 3 for a favorable report upon two resolutions concerning the attitude of Attorney-General Knox toward certain combinations. All of the Democrats were on hand, but only 4 of the Republicans. It is understood that the Republicans had intended to let the resolutions sleep. Having a majority, the Democrats insisted upon a vote. Chairman Jenkins voted with them. One of the resolutions (both were introduced by Mr. Williams, the Democratic leader) asks Mr. Knox to inform the House whether he has taken any

steps to enforce the criminal provisions of the Anti-Trust law against the persons and corporations adjudged to be guilty in the recent civil proceedings against the Northern Securities merger. The other asks him to say whether any investigation as to the alleged combination of the anthracite coal railroad companies has been made by the Department at the suggestion of any one, and whether the Department has a report of such an investigation. The resolutions call for the reports and other papers. It is expected that debate and action upon them cannot be avoided in the House. The second resolution relates to the investigation made by the District Attorney of New York, on account of the request made and the evidence submitted by Mr. William R. Hearst, now a candidate for the Democratic Presidential nomination. It is asserted that District Attorney Burnett's report to Mr. Knox recommended that the coal railroads be prosecuted under the Anti-Trust law. In support of another resolution, calling upon Mr. Knox for the evidence submitted to him, Mr. Hearst, accompanied by his counsel, has made an argument before the committee. He has also filed with the Attorney-General a complaint alleging that the Philadelphia & Reading and the Jersey Central railroad companies have unlawfully combined by means of a holding company, and asking Mr. Knox to sue them under the Anti-Trust law.—Representative Gaines, of West Virginia (Republican), has introduced a resolution calling for an investigation as to the alleged association in combination, or under common control, of the Pennsylvania, Baltimore & Ohio, Chesapeake & Ohio and Norfolk & Western railroads. This is probably intended to suggest that here may be found an unlawful combination of parallel and naturally competing lines. —The application of Mr. Harriman and the Union Pacific interests, in opposition to the proposed *pro rata* distribution of the Northern Securities assets, was denied by the Circuit Court at St. Paul, on the ground, in part, that this method of distribution does not violate the court's decree in the merger suit. The method in question has since been approved by a large majority of the Northern Securities stock, but the Union Pacific interests have again shown their opposition by applying to the Circuit Court in New Jersey for an injunction to prevent the Hill-Morgan interests from distributing the assets in that way. As we explained last week, they desire to recover the $78,000,000 of Northern Pacific stock which they deposited, and with it the control of that road and of the Burlington system.—An investigation concerning the companies which are said to be associated in what is called the Beef Trust has been undertaken by James R. Garfield, Chief of the Commerce Department's Bureau of Corporations.

The Work of Congress

The bill for two new States was passed in the House last week by a party vote, except that Mr. Cushman, of Washington, and Mr. Needham, of California, were counted with the Democrats in the negative. By the terms of this measure one State is formed by the union of Arizona and New Mexico (and is to be called Arizona), while the other (to be known as Oklahoma) is composed of Oklahoma and Indian Territory. A vote in the Senate at this session is not expected. Five Representatives are assigned to Oklahoma and two to Arizona. The sale of intoxicating liquors to the Indians is forbidden, and each of the new States is required to prohibit polygamy in its Constitution. The suffrage may be restricted by educational qualifications, but must not be withheld from negroes on account of their race or color. The Delegates from Oklahoma and New Mexico supported the bill; the Delegate from Arizona opposed it.—To a general appropriation bill there was added in the House as an amendment the bill designed to cure such defects in the Chinese Exclusion law as will be due to the approaching expiration of the treaty with China, altho such addition was in violation of the rule excluding amendments that "change existing law." But the point was not raised. Then the Democrats offered as an amendment the essential words of the recent pension order concerning disability for age. Thus the Republicans were confronted by an amusing parliamentary dilemma. To en-

act the order would be an admission that the enactment of it, as a ruling for which existing law gave no warrant, was needed; to reject it, upon the point of order that it "changed existing law," would also seem to be an admission that the ruling had no sound basis in the pension statutes. The latter horn of the dilemma was chosen by the Republicans, who raised the point that the amendment "changed existing law," and this point was sustained, while the Democrats indulged in derisive laughter.—A bill reported in the House removes the limit ($100,000,000) for subsidiary silver coin, but requires that additions be made by recoining silver dollars on hand. A brief amendment attached to the Sundry Civil bill by the Senate Finance Committee, however, removes the limit without this accompanying requirement, and thus (owing to existing laws) opens the door for further purchases of silver bullion, because the supply of bullion on hand is almost exhausted. This interesting amendment, which has been the subject of much comment, is the work of the Republican majority of the Finance Committee, and does not appear to have the approval of the Treasury Department.—The President has nominated Beekman Winthrop, of New York, formerly Governor Taft's private secretary, and now a judge of the Court of First Instance in the Philippines, to be Governor of Porto Rico.

Labor Disputes

There has been no settlement of the labor controversy in Colorado. When Judge Stevens granted a writ of habeas corpus for President Moyer, of the Western Federation of Miners, who was held in custody by the militia at Telluride, General Bell declined to produce him in court. Judge Stevens fined Bell $500, ordered his arrest, and expressed regret that he could not punish Governor Peabody, who, he said, was not less guilty. General Bell remarked that the sheriff could arrest him only after passing over the dead bodies of his soldiers. Afterward, the Governor decided to obey a similar writ issued by the Supreme Court. On the 21st Moyer was taken to Denver under a strong military guard. At the station there he was met by many of his friends. One of these, Secretary Haywood, of the Federation, resenting an order addressed to him, struck Captain Welles (the commander of the guard) in the face. The soldiers beat him unmercifully, placed him under arrest, and took him to a hotel, where he attempted to overcome all of them, and was pounded again. In one of these fights bayonets were used in subduing him. Haywood is now in the custody of the Denver sheriff. In court General Bell said he had been directed by the Governor not to release Moyer on a writ of habeas corpus. After arguments had been made, the prisoner was taken back to Telluride, pending a decision as to his release on bail. At a mass meeting President John Mitchell urged the miners to vote against the Republican party if that party should not repudiate Governor Peabody's acts.—At Garrett, in Southwestern Pennsylvania, the coal miners went on strike in December against a wage reduction of 12 per cent. The places of nearly all of them have since been filled, and the idle strikers have been making attacks upon the non-union men. During the night of the 19th, incendiaries, believed by some to be strikers, burned the house of Jeremiah Meyers, a non-union miner. Meyers escaped, but his wife, his son, his two daughters and two of his grandchildren were burned to death. The strikers and the men who took their places are well armed and a collision is expected.—The National Association of Clothiers at its recent convention adopted resolutions against the "closed" or union shop, arbitrary restriction of output, and a limit of the number of apprentices. This was regarded by the United Garment Workers as a declaration of war. Preparations were made for a general strike, which would have involved at least 60,000 employees, but action has been postponed to await the result of a conference with the employers' association.—In Pittsburg 1,000 school teachers have organized to obtain an increase of pay.

The Mormon Inquiry

Testifying in the Smoot investigation last week, Brigham H. Roberts, a Mormon who was excluded from the House a few years ago, said that he wouldn't think of accepting a nomina-

tion for political office without first getting the consent of the Church. He admitted that every nominee who had obtained the consent of the Church had been elected, and that no Mormon who had failed to get such consent had been successful at the polls. Mr. Roberts, who has three wives (knowledge of his marriage to the third having been withheld from the first two for three years), admitted that he was now living with them in violation of the statute and also of the law of God and the Church as set forth in the manifesto of 1890. He had been married to his third wife in 1890, some months before the manifesto was issued, by one Wells, counselor to the Twelve Apostles, who was not reprimanded for this violation of the statute. Altho the manifesto was a binding law of the Church, Mr. Roberts explained that it was not wholly a divine revelation, being an administrative act, "colored by President Woodruff's personality." He declined to describe the ceremonies of the Endowment House. Angus M. Cannon, a Patriarch of the Church, who has six wives, admitted that, since 1890, he had been living with them in violation of both the statute and the law of God. President Smith, he said, had received a vote of confidence at the general conference since his recent admission to the same effect. Calvin Cobb, publisher of a paper in Idaho, said that one-third of the people of that State were Mormons. Because they held the balance of power, the leaders of both parties made terms with the Church. It was due to Mormon influence, he thought, that the Legislature recently provided for a constitutional convention, the Mormons desiring, it was believed, to get rid of the anti-polygamy declarations of the present Constitution. O. W. Powers, formerly a judge in Utah, and afterward chairman of the Democratic committee, testified at length as to the influence of the Church in politics. The young men and women now opposed polygamy, he said. But in Mormonism there was something worse than polygamy, and this was the exertion of a controlling influence in politics, society and business by the hierarchy, to attain ends at variance with American institutions.

The British Budget The Chancellor of the Exchequer, Austin Chamberlain, has introduced his budget program for 1904-5 into the House of Commons. It does not embody any of the protectionist provisions advocated by his father, but calls attention to the great deficiency in the revenues due to industrial depression and the expenses of the war, amounting to $13,620,000. During the past few years the nation had created a debt of $940,000,000, of which $798,000,000 was due to the war. The customs for the year had fallen $4,000,000 short of the estimate, and excise showed a deficiency of over $6,000,000. This was partly due to a decreased consumption of beer and spirits owing to the fact that the people had less money to spend. Owing to depression on the Stock Exchange there was a shortage of $4,500,000 in revenue from stamp dues. There was an increase of expenditure as well as a deficiency of revenue, so the year closed with a total deficit of $27,075,000. Mr. Chamberlain did not think that the income taxpayer should be compelled to assume the whole of the additional burden, and he did not propose to increase the duty on wines and spirits and sugar. The Government would ask for the addition of another penny on the pound to the income tax, which will bring it up to a shilling on the pound, and a duty of two pence a pound more on tea and additional duties on tobacco. He estimated the expenditure for the year 1904-5 at $614,405,000. The chief cause of the industrial depression, according to Mr. Chamberlain, was the glut of gilt edge securities due to the increase of municipal activity and its extension into new lines of work. The total outstanding loans of local authorities were $2,060,000,000, and sooner or later this vast local indebtedness would have to be paid.

Debate on the Tibetan Mission The conflict at Guru necessarily changed to a certain extent the character of the British expedition at Tibet. Before this event it could be considered as a purely political mission under Colonel Younghusband escorted to insure its safety by a military guard under General Macdonald. After a resort to arms became necessary for the

advance of the expedition it assumed the nature of a military operation, and as such Mr. Brodrick was obliged to ask the authority of Parliament for the use of Indian troops beyond the frontier, and for the payment of the expense of the expedition out of the revenues of India. He defended the action against the charge that it was hasty by stating that it was only after fourteen years of fruitless negotiations that it was undertaken. If the Government of India had permitted the Tibetan Government to continue to violate its solemn treaties, it would have incurred the contempt of the people of the frontier States of Nepal and Sikkim. He denied that there was any probability that circumstances would ultimately compel the annexation of Tibet. He did not contemplate any such unhappy contingency, and were it to occur he would consider it one of the greatest misfortunes that could happen, for British responsibilities in Asia were sufficiently great already. The leader of the Opposition, Sir H. Campbell Bannerman, and Sir H. Fowler asked that the plans of the Government be made plainer. Quarrels about pasture in the Chumbi Valley and the pulling down of demarcating pillars on the frontier were not sufficient provocation for an armed invasion and slaughter. There was room enough in Asia for both Russia and England. Why could not their differences be settled by treaty such as had so happily been arranged with France? The Government was sustained at the conclusion of debate by a vote of 270 to 61.

Gyangtse Occupied

The British Mission reached Gyangtse, which has been considered the terminus of the expedition, on the afternoon of April 11th, without the loss of a man. Three days before a force of 2,000 Tibetans had defended a strong position at Red Idol Gorge near Khangma, where high mountains hem in the sharply winding river, but after bombardment of the crest, the Thirty-second Pioneers forced a passage and killed 200 Tibetans. The soldiers, numbering about 500, fled from the fort at Gyangtse on the arrival of the British, taking with them their guns and portable property, and the fort was surrendered by the Chinese general and the Tibetan Jongpen. The fort was blown up because it was uninhabitable, and from its position on a rock 500 feet high overlooking the town, it dominated the camp. The walls and buildings of the fort were massive and some 400 yards in extent. In one of the rooms were found scores of human heads, some of which had been recently severed, notwithstanding the Buddhist prohibition of the taking of life. No authoritative Chinese or Tibetan embassy from Lhasa has yet arrived at Gyangtse, and it is expected that the expedition will have to proceed toward the capital.

The Hungarian Railway Strike

For four days almost all traffic on the state railways of Hungary was suspended, owing to a strike of the employees, and the mail, telegraph and telephone service, being also in the hands of the Government, was stopped at the same time. The cause of the strike was dissatisfaction with a bill which had been introduced into Parliament rearranging the wage schedule. The employees decided to hold a mass meeting in Budapest for the purpose of preventing the passage of the bill, and delegates from every station were ordered to attend. The Minister of Industry and Commerce refused to allow the delegates to attend, on the grounds that they had no permission to quit work, and that they had not obtained from the police the necessary previous authorization of the mass meeting. At this a general strike was ordered by telegraph, and 60,000 employees quit work at once, leaving the trains wherever they stood. Train loads of perishable freight and food products were thus abandoned, greatly to the distress of the cities depending on them. If it had not been for water communication by the Danube, and the few private railway lines which were kept running, the two capitals of Budapest and Vienna would have been completely cut off. Passengers were stranded wherever they happened to be, and had no way of informing their friends of their condition, since all forms of communication being Government monopolies were in the hands of the strikers. In one case 300 poor people were

left for three days at a way station without food supply and sleeping on the train. As soon as the Government began to employ new men to take the place of the strikers, violence was resorted to for the purpose of preventing the resumption of traffic. Telegraph lines were cut, rails torn up and cars robbed. Only a few trains a day left Budapest, worked by soldiers and railway officials. Conferences with the strikers proved fruitless, as they refused to return to work unless they were guaranteed higher wages. Finally a royal order was issued calling out for military service in manning the railroads all of the reserves in the Hungarian army. A large force of police, with two squadrons of Hussars, surrounded the strikers' camp at noon on the 23d, and arrested the leaders on the charges of treason and riot. The Chief Commissioner, in a speech to the strikers, notified them that all who had been guilty of violence and law breaking would be punished, and ordered all who were liable to military service to report to their respective army corps that evening under penalty for desertion and mutiny if they refused. In the afternoon a committee of the strikers notified the Minister of Commerce that the men would accept the terms which had been offered by the Government and return to work. The Government declined to receive the strikers on these terms, and informed them that the conditions previously offered were no longer open to their acceptance. Most of the men have returned to work, and trains are running as usual.

Strikes in France and Portugal

A strike, which began on April 1st among the cotton spinners at Amiens, led to serious riots on the 8th, when cavalry charges were used to clear the streets. For the first few days there was no violence and popular sympathy was with the spinners, who were getting net wages of only $3 to $3.50 a week, and were demanding increased compensation for a half hour lost. All the employers refused to treat with the union. The dyers next stopped work, and finally all the building trades, until the total number of strikers was 5,000. A band of strikers appeared before one of the factories which was still running and attempted to stop work by force, but they were dispersed by a squad of fifteen police, whose chief was struck down by a stone. The crowd again collected in another place and met a patrol of Hussars with stones and yells. They charged and wounded a farm boy named Désiré Boivin, who was cut on the head and was thought to have been killed. A mob of 2,000 strikers with a red flag, on which was inscribed *"Boivin mort. A bas les assassins,"* marched to the city hall, demanding the surrender of the prisoners. All the next day the rioting continued, barricades were thrown up in the streets and many shops were looted. The strikers assembled in mass in front of the labor exchange and refused to disperse at the command of the chief of police, who then ordered all good citizens to retire and read the riot act to the crowd, after which the cavalry charged with sabers. The mob gave way, but only to slip through the back streets and assemble in still greater numbers on the flanks of the soldiers, throwing bottles and stones and occasionally shooting revolvers. Many were wounded on both sides, but none mortally. On the 9th a proposition for arbitration by the justice of the peace was accepted by the textile workers and the building trades on the one side and the manufacturers and contractors on the other. The central labor union issued a proclamation disavowing the instigators of violence.—All of the newspapers in Lisbon, twenty-one in number, suspended publication for several days rather than agree to a demand of the compositors for higher wages.

Along the Yalu

The map we present this week gives in some detail the country along the Yalu River, the only place where the Russian and Japanese armies are in contact, and the probable scene of the first important land engagement. There have been many rumors the past week to the effect that the Japanese had crossed the river and had been repulsed with the loss of several thousand men, but it is not probable that anything more serious than constant skirmishing has taken place, and it is not at all certain that the Japanese will soon attempt to push forward into Manchuria. The Japanese lines are well fortified and

Map of the Yalu River

extend from Yongampho to Su-ku, about ten miles above Wiju. Above this the river is usually fordable, and the channel between Wiju and Samalind Island is also shallow; but on the opposite side of the island the channel is about twenty feet deep. At Wiju a large amount of pontoon material has been collected and on the night of the 21st a Russian detachment of volunteers crossed the river in boats for the purpose of setting this on fire, but they were met with a heavy fire, and Japanese barges nearly succeeded in cutting off their retreat. One of the Japanese barges was sunk. Wiju is a town of about 8,000 inhabitants, but most of the Koreans have been displaced by the Japanese. Like most Korean cities, but very different from the Chinese custom, it is situated on a hilly promontory at the upper end of the plain about five miles in width, which extends along the river from Yongampho to the north. Beyond the plain the river is paralleled by a ridge some 3,000 feet high. On the Manchurian side there are lower and irregular hills set transverse to the course of the river. Russian forces are reported to have invaded Korea across the Tumen River for the purpose of harassing the right flank of the Japanese, and have attacked Songjin, but it is not known what force has taken part in this movement.—At Port Arthur a Russian steam launch, which was placing mines in the harbor, exploded one of them under its stern and a lieutenant and twenty men were killed. The Vladivostok squadron of three cruisers is reported to have appeared off the coast of Eastern Korea, and two torpedo boats entered the port of Wonson (Gensan) and sank a small Japanese merchant steamer, the "Goyo Maru."

The Dressmaker's Life Story

BY AMELIA DES MOULINS

I WAS born in a country district of France, on the edge of a great forest, about 150 miles southwest of Paris. When I first came to identify myself I was a little red-cheeked, roly-poly, black-haired, black-eyed baby of four years or so, tumbling about under the trees trying to gather faggots.

My father had been one of the men in charge of the forest, and when he was killed by the caving in of an earthbank the great man who owned the estate on which we lived allowed my mother to continue gathering firewood as before, which was to us quite a valuable privilege, as fuel is scarce and dear in France.

Our cottage was of stone. It was about 200 years old and had tiled roof, tho most of the cottages of the neighborhood were thatched. The walls were nearly two feet thick and all the front and sides were covered with ivy. There were only two rooms on the ground floor, but overhead was a large loft, with the floor boards loose on the beams. My brothers Jean and Francois slept in the loft, which they reached by a ladder, and sometimes the straw from their bed would come sifting down through the cracks above.

The large room on the ground floor was kitchen, dining room, sitting room and parlor. It had a great hearth, where a big iron pot hung on a thick chain, and both chain and pot were relics that had long been in my father's family. The only furniture here was a bench, four wooden stools and an old table, and the only picture on the plastered walls was a print of the Madonna. The other room was mother's bedroom, and I and my sister Madeline had a cot in the corner.

In comparison with some of our neighbors we were looked upon as wealthy, seeing that mother owned the house and field of two acres, and that she had about $400 saved up and buried in an old iron pot in the earthen floor of the little cellar, which was under the middle of the big room and reached through a trap door.

Mother was a large, stout, full blooded woman of great strength. She could not read or write and yet she was well thought of. There are all sorts of educations, and tho reading and writing are very well in their way, they would not have done mother any good. She had the sort of education that was needed for her work. Nobody knew more about raising vegetables, ducks, chickens and pigeons than she did. There were some among the neighbors who could read and write and so thought themselves above mother, but when they went to market they found their mistake. Her peas, beans, cauliflower, cabbages, pumpkins, melons, potatoes, beets and onions sold for the highest price of any, and that ought to show whose education was the best, because it is the highest education that produces the finest work.

Mother used to take me frequently to the market. We had a big dog and a little cart (mother and the dog pulled the cart)—one can see hundreds of them in any French market town to-day. The cart was filled high with fowls and vegetables, and when I was very small I sat on the top holding our lunch, which was wrapped in a napkin. It was always the same, a half loaf of black bread to be eaten with an onion. I was inclined to be particular, and sometimes I would not eat the black bread, which was hard and sour, but mother would just lay it aside and say that I would go to it before it would go to me, and I always did go to it, except one day when mother got impatient with me for being sulky and gave my bread to the dog, Hero, who ate it like the greedy thing that he was. I boxed his ears for that, but he only smiled at me. He was a big, black Newfoundland fellow, very good-natured.

We used to reach the market place about half-past five o'clock in the morning, and when we got there mother would back the cart up against the sidewalk and begin to shout about the chickens, eggs and vegetables. All the women with the carts were shouting and all the dogs barking, and there was great business.

The market women were a big, rough,

fat, jolly set, who did not know what sickness was, and it might have been well for me if I had stayed among them and grown to be like mother. They had so much hard, healthy work that it gave them no time to worry.

One time in the market place I saw a totally different set of women. It was about eight o'clock in the morning, when some people began to shout:

"Here come the rich Americans! Now we will sell things!"

We saw a large party of travelers coming through the crowd. They looked very queer. Their clothes seemed queer, as they were so different from ours. They wore leather boots instead of wooden shoes, and they all looked weak and pale. The women were tall and thin, like bean-poles, and their shoulders were stooped and narrow; most of them wore glasses or spectacles, showing that their eyes were weak. The corners of their mouths were all pulled down and their faces were crossed and crisscrossed with lines and wrinkles, as tho they were carrying all the care in the world.

Our women all began to laugh and dance and shout at the strangers. It was not very polite on our part, but the travelers certainly did look funny.

I was about six years old when that happened, and the sight of those people gave me my first idea of America. I heard that the women there never worked, laced themselves too tightly, and were always ill.

I would have grown up like mother and her friends but that I did not seem to be good at their work. I took to reading, writing, sewing and embroidering, and I did not take to gardening and selling things, while I cried when they killed pigeons or chickens. So I was sent to Paris to live with my Aunt Celestina, a dressmaker, employed by one of the great establishments.

My aunt, tho mother's sister, was not at all like her. She was small, thin and pale, with quick, black eyes and a snappy sort of way, tho she was quite good hearted.

It was not very long before I found out just how the fashions are made. There are three great establishments in Paris that lead all others. These have very clever men working for them as designers of cloaks, hats and dresses. These designers not only know all the recent fashions, but also all the fashions that there were in the world hundreds of years ago. They have books full of pictures to help them, and what they try to do is to make the women change their dresses just as often as possible. That's the reason they keep changing the fashions.

Each time they make a new fashion they make it just as unlike the one that went before as can be, so that things that are six months old look ridiculous, and the women all over the world who are trying to follow the fashions put the old dresses away, even tho they have only been worn once or twice. One time the sleeves are big at the shoulders and narrow at the wrists and at another time narrow at the shoulders and big at the wrists. One time the dress is tight at the waist and another time loose, and there are all sorts of changes in the size, shape and hang of the skirt; and in addition all the changes of fashion in colors and materials.

The keynote of fashion making is change, for the women all the over the world are watching Paris, and they say "You might as well be out of the world, as out of the fashion." The greater the changes the more dresses sold.

When these great milliners have decided on the new fashions they get some of the best known women in the city to lead off with them. These women are given magnificent costumes of the newest design to wear, and, in some cases, are even paid for wearing them. Of course these women are great beauties, and when they appear in the parks, or at the opera, all the other women envy them, and all those who can, run away and get something of the same kind.

My aunt and I lived in a room on the fifth floor of an old brick house in one of the back streets. They were all poor people in the house, and I found the children very different from those in the country. They were not religious. The boys swore and smoked—even little ones of my own age—and the girls knew all sorts of bad things. There was no place to play but in the streets, and, for a time, I was very homesick. The other children laughed at me, but they were not

altogether bad. They were good natured in their way. Most of them had never been in the country and they thought that I was telling stories when I described the forest where you could walk for miles and see nothing but the trees.

Some of these children belonged to people who beat them, and a few had hardly any clothes. My aunt used to pity them so much, and in the evening she taught me dressmaking by making things for those children. She taught me measuring, cutting out, basting and stitching. In the day time I went to school. Mother sent aunt some money to help keep me, and as I had a natural love for dressmaking I got along. In the afternoons when school was over and before my aunt returned from her work I used to go and see all the beautiful things in the museums and art galleries.

I was with my aunt, learning all she could teach, till I was fourteen years of age, which was in 1895. I was quite a well grown girl then, and my aunt was going to get me employment in the place where she worked, when she died of a heavy cold, pneumonia, I suppose. After she caught the cold she went to work, and grew worse, but she wouldn't stop for two days. On the third day she was in a high fever and so dizzy that she could not stand when she rose from bed. I got her some medicine, but I did not know what to ask for and the druggist did not exactly know what to give. It did no good. So at last I called in a doctor, but she grew worse very fast and seemed choking. Some of the neighbors sat up with her in the early part of the night, but at three o'clock in the morning I was the only watcher. My aunt, who had been breathing very heavily and seemed unconscious, suddenly sat up in bed, with her eyes staring. She was frightened and began to cry.

"I'm dying," she said, "and I'm not fit to die; I have been so wicked."

I spoke to her and held her hands, but I could not comfort her.

"You are not dying, and you have not been wicked," I said.

"Oh! Oh! I have been so wicked!" she cried, again and again.

I declared that she had not done anything wrong, but she answered:

"Those clothes that I made for the poor children, I stole all the goods from our customers, because I could not bear to see the little ones in such a state. Oh, it was very bad. If I wanted to give the children something it should have been my own."

I was so frightened that I called up the people who lived in the next room and one of them went for the priest, and after he had talked with my aunt for a few minutes she seemed comforted, but she died the next morning.

I went back to my mother's house for two weeks, but I could not stay there, so I returned to Paris, where I went to work in the shop that had employed my aunt.

Many of our best customers were Americans. They were all very rich, and we heard that everybody in America was rich. They drove up to our shop in carriages and automobiles, and they wanted dresses like those of the queens and princesses. Some of them spent whole weeks in our shop.

Part of the time I had to help try on and heard a great deal of the conversation of these ladies. It was all about dress and money. They said that Paris was just like their idea of heaven, tho the ones who said that had seen very little except our shop. They were mostly daughters of working people, common laborers, butchers and shopkeepers who had grown rich some way, yet they were more haughty and proud than our own aristocrats. In fact, they were pretending to be aristocrats. I remember one of this sort who declared that she hated America because it was a republic and contained so many common people. She was sorry that France was a republic and hoped it would again soon have a king. Our forewoman always agreed with all the customers, and she agreed with this one till her back was turned. Then she said:

"What a fool that woman is! She is coarse enough for the fish market, yet she thinks she can make people believe she is an aristocrat. I wonder what she is proud of?"

Most of the Americans I disliked, but there were a few of a different sort. One very beautiful, tall girl, whose father owned 10,000 miles of telegraph wires and something like $40,000,000, was as gentle, simple and pleasant as if she had been poor. She smiled at me when I was

helping her to try on a new dress, and said:

"What good taste you have. If one as clever as you came to America she could do very well."

I had been for a long time thinking that same thing. If the Americans whom I had seen could have so much money, why not I? I said that to Annette, my room mate, and she also wanted to go to America.

Of course, it was all on account of the money, as there is no country like France and no city like Paris. We heard that some dressmakers in America received as much as 100 francs for a week's work. That seemed to me a great fortune.

By working at night Annette and I saved 300 francs, but it was stolen from our room and we had to begin all over again.

That was the reason why we did not reach America till 1899. We saved and saved, and we pinched ourselves hard, but it takes a long time for two sewing girls in Paris to scrape together 500 francs, and we could not start with less, because we wanted to have some money in our pockets when we landed.

It was in September when we started. I had never seen the ocean before and the voyage was all strange. When we approached America a man came to us and asked how much money we had. We showed him 40 francs.

"That is not enough," he said; "you will be sent back. No one is allowed to land in America unless he has 100 francs."

We were dreadfully frightened, but the man said that if we gave him 20 francs he would lend each of us $50 till we passed through the immigrants' gate and got into the city of New York. We gave him 20 francs and he gave each of us a $50 bill.

"But will they not think it strange that I and Annette have each a $50 bill in American money?" I asked.

"Not at all," said he. "American money is now good all over the world."

When we reached the immigrants' gate, however, the men there told us that the $50 bills were no good. They were what is called Confederate. The man who had given them to us had slipped away. We would have been sent back to France if some other immigrants had not taken pity on us and lent us some money.

Oh, how glad we were to get away from that place and into the city. We landed in a sort of park, and a good woman, who was one of those that helped us, treated to peaches and popcorn. The peaches were the largest and ripest I ever ate. They fairly melted in our mouths.

A car took us to a place in South Fifth Avenue where there are many French people. We were horrified when we found that we must pay $2 a week for a miserable room, but we could do no better. We had only 10 francs left, and all the first week after our landing we lived on potatoes—that we roasted over the gas flame—and stale bread. The woman who kept the house walked about in the passage smelling the air and saying that some one was cooking in one of the bedrooms, but she did not find us out.

That was a horrible place. Most of the people in it seemed to be mad; they made such awful noises in the night—singing, shouting, banging pianos, dancing and quarreling.

The partition that separated our room from the one next door to it was thin and there was a hole in it, through which a man once peeped. He talked at us, but we nailed a piece of tin over the hole; and as for his talk, we never answered it.

I don't think that that house had been dusted or swept in six months; the servants looked most untidy. Most of the women lodgers slept till noon each day and then walked about the passages wearing old wrappers. Their hair was done up in curl papers and their faces were covered with a white paste to improve their complexions. They looked hideous till they washed themselves later in the day. These were all married women who had no children and nothing to do but gad about.

Each day after our arrival in New York we wandered about the streets looking for work, but we did not know where to look and had no luck. We could not speak English and that made it very hard. We might have starved but that Annette made $2 posing for an artist, whom she met quite by chance. He had been in Paris and he knew immediately that she was French. He saw by the way she looked at the shop signs that she was strange to the city and he

spoke to her in French. Of course she answered, and they became acquainted.

"How did you know I was French?" she asked, and he answered:

"A French girl! Ah, how could I mistake you for one of another nation?"

That is the truth, too, tho I say it myself. All the world knows that we French have the true artistic taste, and we show it most in our dress. The Germans or the English cannot make dresses or hats, and even when we make for them they cannot wear the clothes properly. There is something wrong somewhere, probably with the color scheme. Those other people do not understand, they cannot comprehend, it is impossible to convey to them the conception of true harmony. It is like trying to teach the blind about light. They lack the soul of the artist, and so their dresses are shocking, hideous discords of form and color. When I see them I simply want to scream.

Berlin has lately been trying to make fashions of her own. Pah! Pooh! What presumption!

Annette is tall and fair, while I am dark and not more than medium hight. The artist posed her as a Venetian flower girl with bare feet. I saw the picture lately hanging in a great gallery. It is very beautiful and exactly like Annette—tho she always says that I am the beauty. Of course that is not true.

After we had been for eight days looking for work without finding any we spoke to the woman who kept the house where we lived. She knew a little French.

"I think that I can get you situations," she said, "but they will cost you $10 for each."

I told her that we had no money.

"No matter," said she; "you can pay me after you are paid, and I will then pay the forewoman. But you must not say anything to her about paying, because the proprietor does not know about it." The next day we went with the woman to a Sixth Avenue dressmaker, where we were engaged at $7 a week each, which seemed to us good pay. We had to give the woman of our house $5 a week each for two weeks, and as we paid $1 a week each for our room, we nearly starved trying to live on the remainder. At the end of two weeks we were discharged by the forewoman, tho there was plenty of work. I learned afterward that the forewoman made a great deal of money that way, by receiving pay for hiring girls whom she afterward discharged.

We seemed to be in a worse state than ever and cried all the night after we were sent away from the Sixth Avenue place. But at six o'clock in the next morning we rose and said long prayers, and I wrote a sort of letter to be shown. It said like this:

> MADAME: Please to behold us as two girls who have of Paris the art dressmaker from the best models taken to make the dress for the American, we will comprehend so well if you but try. If you please,
>
> ANNETTE,
> AMELIA.

I wrote that because I could take time and use the correct language as I had found when I spoke the English Americans did not understand.

We hurried into the street, having no breakfast, but full of hope, for it was the season of dressmaking and we surely must get something.

We entered a fine place on Twenty-third Street and a man behind a counter sent us upstairs, where we found twenty women engaged. The proprietress read my letter and asked us questions. She did not seem to understand well, and called a German girl who spoke French.

I had all my life hated Germans, but I could not hate this girl as she spoke to us so kindly.

I told her where we had had experience, and what we could do, and she said to the proprietress:

"We must have these, Miss G——. They come from the best place in Paris and look clever."

"Nonsense!" said the proprietress; "we don't want them. They are mere apprentices."

I understood what she meant and said in French that we were not apprentices, but of long experience, and Annette, too, joined in.

But the proprietress was only pretending. She wanted us all the time. So at last she said:

"But how much money would you want?"

"Seven dollars a week," said I, be-

cause I thought that I might as well ask for plenty.

The proprietress almost screamed:

"Seven dollars a week, and you have just landed!"

"Oh, no," I said; "we have been here nearly a month."

At last we were engaged at $6 a week each and they put us at work immediately. Our hours were from eight o'clock in the morning till six o'clock in the evening. When we went home that night we were very happy and treated ourselves to a little feast in our room. On six dollars a week we knew that we could live finely and we felt sure that we could keep this place, as they had put us on good work at once and we knew that we had done well."

Our proprietress was full of tricks. In appearance she was a tall, thin, sharp faced woman with fair hair. She was very quick in speech and action, and a great driver among the girls. She did all the measuring and cutting out and her perquisites included all the materials that were left over from the dresses.

A tall woman would need seventeen yards of silk or other narrow goods, while one who was shorter might get along very well with fourteen yards. Our proprietress would always exaggerate the amount of material needed and then, in cutting out, would be able to reserve some for herself. Often she got as much as two yards. These pieces she slipped into a private drawer, of which she had the key. It did not take her long, therefore, to get enough to make herself a new skirt or a waist, and odd pieces could be used as piping or as trimming for hats.

Accordingly she was always very well dressed, and tho sometimes customers recognized parts of their own materials in her costume, they seldom said anything.

Once, tho, I thought there was going to be a scene. A stout lady who was one of our best customers came in one day and saw our proprietress just going out to lunch. The stout lady immediately stood still and glared at the proprietress's new hat, which was on her head. It was a very stylish hat and the silk trimming was precisely the same as the piping of the lady's dress that had recently been made at our place.

"Why, you've got my piping!" she cried.

The proprietress flushed and smiled, but she was equal to the occasion.

"Yes, Mrs. Miller," she said, "it's the very same as yours. The truth is I admired the material so much that I sent out and bought some. Don't you like my hat?"

"Oh, yes," said the stout lady. "Where did you get that material?"

This was a catch, because there was only one store in town where it could have been bought, but our proprietress was not to be trapped.

"One of my girls got it for me. I don't know where she got it," she said.

"Humph!" exclaimed the stout lady, and wandered away without another word.

She came back later on and gave us more custom. She knew that she was being robbed, but she knew, also, that it was the dressmakers' rule to help themselves from their customers' material.

On another occasion a lady who had given five yards of wide ribbon for trimming came back after she had received the dress.

"I don't understand how it is, Mrs. ——," she said. "I gave you five yards of this ribbon. There's only four yards on the dress. I measured it with the tape measure."

The proprietress produced tape measure and gravely measured the trimming.

"Dear me! you're right," she exclaimed. "Now, what can have happened to that other yard? Where can it be? Girls, did you see it any place?"

The customer just sniffed.

We all buzzed about, but it was the proprietress herself who found the missing ribbon under a pile of goods. She appeared to be greatly surprised, and the customer sniffed again.

Our proprietress, I think, never told the truth while she was at business. She would promise most solemnly to have a dress made up in three days when she knew quite well that it could not be done in two weeks.

Sometimes when the bell rang she would look out and say:

"Oh, girls! There's that Mrs. K—— come again. I promised for sure that her dress would be ready to try on this afternoon and I haven't put the scissors

in it yet. Run down, Katie, and keep her in the parlor."

Then she would rush at the goods and the pattern, cut out with lightning speed and toss the various parts to different girls to baste. In half an hour there was the dress, basted, ready to try on, and the customer none the wiser as to how it was done.

Some of our customers suffered greatly in their efforts to be fashionable, for fashion takes no account of the natural shape of the human body. It did not matter so much to the thin women, because all they had to do was to stuff their figures, but some of the stout women were martyrs.

One very beautiful woman was fat and would not acknowledge it, as she had been quite slim.

"My waist measure," she said, "is 24 inches."

She insisted on this and made two of us girls pull her corset strings till we secured the right girth.

My! that was a job! The squeezing must have hurt her awfully. She was gasping for breath and perspiring rivers, but she would not give up.

When we sent the dress home she brought it back.

"It doesn't fit," she said.

"Where?" asked the proprietress.

"The waist is too small."

"The waist is 24 inches. You gave that yourself as your measurement. All you have to do is to have your corsets tightened as they were on the day when you were measured."

The poor lady looked at us and we all nodded assent. We had heard her insist that 24 was her measurement. Soon she was again in the hands of the tighteners, gasping and perspiring.

When the corsets were well pulled in the dress fitted like a glove, but the poor lady's face was the color of blood and she could hardly speak.

"I m—m—must—have—been mistaken!" she gasped.

"Certainly!" said our proprietress. "I never saw a better fit."

The poor lady staggered away trying to look comfortable. I don't believe she could wear that dress, tho, as she was growing stouter.

The only thing to be done for stout people is to make everything plain, avoid bright colors and have all lines running up and down. That gives the appearance of greater hight and less girth.

Lines running up and down make short women look taller. As to tall women, they don't want to look shorter now. It's the fashion to be tall. The plump, cosy, little women is out of date.

The first thing that I and Annette did when we began to have a little money was to move away from the horrible place in South Fifth Avenue. We never could understand those people. Most of them were connected with theaters, and they kept hours that seemed crazy. We got a room in West Twenty-fourth Street for $3 a week—a very good room, too—and made an arrangement with a restaurant to give us breakfast and supper for $2.50 per week each.

So our starvation was at an end, and we had $2 a week to do with as we pleased. In a few weeks we had good clothing, and after that we were able to save a little.

Annette came to me one day with her eyes as big as saucers.

"What do you think!" she said. "That girl Rosa gets $12 a week and she is not as clever as us."

We were both very angry at Rosa, tho I suppose it was not her fault. Still she had no right to get more. It was ridiculous; we were the better workwomen.

"Wait," said I; "we are learning the English."

We waited six months and then asked the proprietress to give us $12 a week. She screamed at us with rage.

"What impudence!" she said.

But we only smiled; we knew enough of the English now and were not afraid.

She gave us $9 a week each and we stayed there six months more. Then, when the holiday season was coming on, we went to a great dressmaking place in Fifth Avenue and told the proprietress about our Paris experience and where we were now working. She asked how much we were getting and we said $18 a week.

That was true, too, because each of us got $9. We would not tell what was not true.

The proprietress said: "Well, if they give you $18 a week in Twenty-third Street we will give you $20 a week here."

When we told the proprietress of the

Twenty-third Street shop she screamed again, and said that we could not go, that she would give us a bad character. We said it was no matter, we would not ask the character from her. Then she cried and said that we had ingratitude and she would give us $12 a week each.

We cried, too. Because after all she was not such a bad one to work for. But we had to go, as it was too much money that we wanted for staying.

So we began in Fifth Avenue, and now it was quite new the sort of trade. We have been in that place ever since, and it was in 1901 when we first began. We have been in the very finest houses of New York, talking with all the beauties and trying on their dresses for them.

The girls here are very beautiful, but I cannot like them. They have not the heart of French women. All that is given to them they take as their due and they are not grateful. They love, but it is only themselves. They do not care for men, except to have them as slaves bringing them the money that they so much need. For fine dress they will do anything.

I have told of the tricks that dressmakers play on ladies, but they are no worse than those that ladies play on dressmakers and on other people. In the first place, many of them won't pay their bills. In the second place, they get costumes made and delivered that they wear one night and then return, saying that they have changed their minds, or that the costume doesn't fit—they deny that they have worn it except to try on—they get $50 or $100 cash and have it charged as a dress or hats in the bill, so as to deceive their husbands. They are finicky and want things changed because their minds have changed. They expect us to remake them in spite of nature. All the fat women insist that we shall make them look thin.

Then if they quarrel with us they use slander.

One of our customers, a very sweet little lady, who is quite wealthy, said the other day to our proprietress:

"How have you offended Mrs. L—?"

"Have I offended her?" the proprietress asked.

"It seems so. I was walking with her on the street the other when you passed. You bowed to me and I responded, when Mrs. L—— said: 'Oh, do you know that person?' 'Why, yes,' said I, 'that's my dressmaker.' 'Indeed!' said she; 'how can you stand her? She fits so badly.' 'I've always found her a true artist,' said I."

Our proprietress was very angry when she heard this story.

"Now I will tell the whole truth," she said. "That woman owes me $850, and it would be more than $1,000, but the last costume I sent C. O. D. 'My husband is not home and I have no money," said she to the girl. The girl in spite of her protests brought the costume away. She came to me and said, 'I have to wear that costume this evening. I am going to the ball!' 'Then you must pay for it,' said I. 'But I have not the money and my husband is away.' 'Get the money,' said I. She did get it and I gave her the costume, but she has slandered me ever since."

Ah! it is a good country to work in, no doubt. Annette is now getting $40 a week and I almost as much, and we have plenty saved; but I am not to live here.

To one born in England, Germany, Austria, Holland or Scandinavia this may appear fine, but not so to the French.

There is but one France and only one Paris in all the world, and soon, very soon, Annette and I will be aboard some great ship that will bear us back there.

New York City.

Chinese Exclusion

BY SAMUEL GOMPERS

President of the American Federation of Labor

THE members of the American Federation of Labor have good reason to protest vehemently at any situation which will again allow the unrestricted entrance of the Asiatic races, particularly the Chinese, into the United States, but I feel I can say positively that the sentiment which is reflected by union labor represents the sentiment of the American people irrespective of class, and the feeling which demands that suitable legislation be enacted to relieve us permanently of the danger with which we are menaced is a national sentiment. Members of our organization are not looking at this question only in the light of competition or the possibility of a reduction of their compensation. We realize, as I believe the mass of the people do, no matter whether they are citizens of the West or the East, that we are again confronted with a menace to our civilization. With the expiration of the present treaty in December, all barriers are removed and there is nothing to prevent the country from being flooded with a horde of Chinese. While the Pacific Coast will naturally be most seriously affected, owing to its geographical location, their influence would extend from ocean to ocean. More than this, our insular possessions are placed in great peril. Judging from their history I feel confident that they would again overrun the Philippines, where they have gone in such numbers in the past. The Hawaiian Islands would unquestionably become thronged with them, and I do not doubt they would settle in large numbers even in Porto Rico, since this island is so adapted naturally for their abode.

Now, what has been the history of Chinese occupation of other lands than their own? It is a history not merely of friction and dissension with the native occupants, but a record of bloodshed. In the Philippines alone, under the Spanish domination, the conflicts with the Chinese resulted in loss of lives actually reaching into the hundreds of thousands. During the period before the present law preventing their immigration to the United States was in force the States of the Pacific Coast formed the scene of many a turmoil in which Americans as well as the foreigners lost their lives. In short, the history of this people shows that they will not mingle with the Anglo-Saxon. Further than this, we have had enough experience with them in America to know that the two races cannot under any consideration remain together without the Anglo-Saxon being influenced and debased by the association, no matter if one lives entirely apart from the other, unless the Chinese are so far in the minority that they are isolated among us. Their tendency is to lower and initiate. They work beneath the surface. They attack the foundation of society. It is in this way that they are most dangerous, a fact of which we have had ample experience.

But it seems to me unnecessary to enter into reasons why provision should be made at once to restrain the incoming of the Asiatic when the present treaty expires. This is no new question which is agitating the public mind. It was brought up a quarter of a century ago. All of the discussion has occurred in my time, and I feel sure this danger to our institutions has been so thoroughly exploited that the citizens of every State are of one mind regarding it. While other portions of the country happily have not had the experience of California and her sister States, the people of New England, New York, the South and the Middle West are fully aware of what the unrestricted immigration of the Chinese into America means to our future. I am able to verify this statement by the vigorous action taken by our various bodies and the protests which have come to our headquarters. They represent every section of the United States, and as I have already stated, I believe they voice not only the sentiment of our organization, but of the American citizen, no matter what his vocation or position.

As to the bill so promptly introduced in Congress by Senator Patterson, I do not see how it can fail to receive the unanimous approval of the two branches of this body. In my opinion, it offers an effective and permanent safeguard, which should be recognized and indorsed by the representatives of the people. I have heard of no opposition to it. In fact it would seem audacious for any one to oppose it, considering the sentiment overwhelmingly in its favor. Again let me repeat that argument is needless. The question of Chinese exclusion is no longer a question. It is imperative and may be considered, in the United States at least, as a closed issue.

As to the effect Chinese exclusion would have in the relations of the United States and the Chinese Governments, I think little need be feared on that score. If the Empire believed we were doing this from merely platonic feeling, it might cause some friction, but it is my opinion that the Imperial Government is as well aware of the situation in America as are Americans, and whatever action we take will not cause it great anxiety. As a matter of fact, the Chinese who are prevented from crossing the Pacific will in most instances remain in their own land, so that any legislation of the kind referred to will benefit rather than injure China.

WASHINGTON, D. C.

The Court of the Canal Zone

[The study of the members of the Panama Canal Commission which is presented here is made by a gentleman who is one of the very few persons acquainted with all the individualities included in that very interesting body. The illustration which accompanies the article is a reproduction of the best group photograph that has yet been made of the Commission.—EDITOR.]

THE Isthmian Canal Commission has assumed its permanent position in the Administration, as a Bureau of the War Department, with the most colossal undertaking before it which the world has known. There are more unsolved, unprecedented difficulties than ever before defied human ingenuity.

Under the War Department the Isthmian Canal Commission holds supreme authority over the canal zone, the work and the workmen. It is practically the court of last appeal, to which we must look for administration, execution and the fulfillment of the utmost that can be accomplished, not only as concerns the canal, but its vicinage; not only in the accomplishment of a perfect water-way, but in the preservation of the health and welfare of those engaged on it, for the time being, and the development, for all time—physical, moral and social—of practically the entire populated region of Panamá. It lies within the sphere of the Commission to establish, on the isthmus, a miniature of the best of America, scientifically, mechanically and socially.

Money estimates for the task cannot be easily or accurately made, but men who have given the matter serious and intelligent thought place the final expenditure at not less than $300,000,000, of which $150,000,000 is at present under appropriation. So that, in any phase, the responsibility resting upon the Commission is little less than stupendous.

Under such circumstances the *personnel* and complexion of the Commission is of grave public interest, and it is a matter for national pride, in a way, that when the colossal work presented itself seven men could be produced who should meet with such universal approval, individually and collectively, as adequate and worthy to assume the responsibility.

With a few exceptions they had never met before, and few, at large, had ever seen more than one or two of them; when they came together in Washington there was a general curiosity and scraping of acquaintance.

The first facts to be noted were that they were nearly all exceptionally tall, and that, in this age inclined to shaven

Benjamin M. Harrod. William H. Burr. Carl Ewald Grunsky.

George W. Davis. John G. Walker. Frank J. Hecker. William Barclay Parsons.

THE MEMBERS OF THE PANAMA CANAL COMMISSION

face, there was only one of them without a beard.

The Chairman of the Commission, Rear-Admiral John G. Walker, U. S. N. (retired), was appointed from the District of Columbia, and, at the outset, a clever bit of diplomacy appears in the fact. As a rule a commission of this kind elects its own chairman, after coming together by order of the appointing power; but in that little collection of brain and *éclat,* Army and Navy, Science and Society, were sure to clash over the first official act, causing outside antagonisms if not internal discord. This was all avoided by the President in quietly nominating Admiral Walker as chairman, and the Senate confirmed him in the position.

Admiral Walker is on the retired list simply to accommodate the unalterable age-limit law which sets an officer aside, according to the calendar, irrespective of mental and physical ability, and, in this case, retired a man in his very prime, as capable in every respect as when he commanded the White Squadron and took the first modern American warships into European waters. He graduated at the head of his class in the Naval Academy. He was with Farragut at New Orleans. He has served in every quarter of the globe and made one of the most able chiefs of the Bureau of Navigation in the Navy Department. He has long been identified with an inter-ocean canal project, and headed the commission conducting the Government investigations in the past.

One could find on the fly-leaf of the nearest book to hand most of what Admiral Walker does not know concerning ships and their requirements, an important subject in connection with the present Commission and one upon which no man in the world is better posted.

Admiral Walker stands full six feet in hight. He is not portly, tho his long, white side-whiskers give one that impression. The mental vigor and force of character in his face instantly fix attention, and, the moment they rest on a man, he feels that the Admiral's quick, keen eyes are looking into him.

His movements are naturally deliberate, but it is not a matter of age with him, for even a trivial thing requiring attention brings him to his feet with the agility of youth. He is very quick to catch a joke and his laugh is the heartiest that one hears among the commissioners.

Following Admiral Walker, as Vice-Chairman of the Commission, is Major-General George W. Davis, U. S. A. (retired), also appointed from the District of Columbia.

Long ago General Davis was lieutenant in a volunteer regiment of Connecticut, from which position he rose through every grade of the regular army, from the War of the Rebellion to the Spanish War, closing his successful career of active service as Commander-in-Chief in the Philippines, where he succeeded General Chaffee. His retirement, too, was only in deference to the inexorable age limit—tho, in these particular instances, we seem to have outwitted it by securing its discarded members for more valuable service.

General Davis stands well over six feet, and, in spite of his age and iron-gray hair, his appearance is decidedly that of a heavy-weight athlete. He is the largest man on the Commission. His motions are always deliberate and rather ponderous. He is slow of speech and, even in casual conversation, evidently weighs each word. Some one said of him the other day that the General was a man of few words but many of them. It is a fact, at least, that when conditions force his lips into action he is nothing loath to use them in a way that carries vast meaning. He has a peculiar way, too, of drawing up his eyes and frowning, when he speaks earnestly, conveying the impression that he has carefully considered the position which he takes and that he thoroughly believes it to be correct. He is characteristically thorough in everything, as was forcibly in evidence in the preliminary meetings of the Commission.

It is probable that in addition to his duties upon the Commission he will be appointed Governor of the Canal Zone, which, in spite of certain opposition that has developed, cannot fail to prove a good selection.

General Davis is not an agreeable antagonist. He is a soldier through and through, and if he fights, he fights to win; but those who know him best admit that to be opposed by General Davis is fair evidence of being in the wrong.

Admiral Walker and General Davis

are to devote their entire time to the work of the Canal Zone, and both have proved themselves past masters in the art of dealing successfully with subordinates—a quality of exceptional value in the task before them. The rest of the members have reserved the right to devote time to personal matters when demands upon them as commissioners will permit.

Another important requirement of the herculean problem was met in the appointment of Col. Frank J. Hecker, of Detroit, Mich. He was the outcome of exigency; a man of valuable resources, developed by the difficulties attending the Spanish War. In the confusion which at first resulted from misdirected efforts to move large masses of troops and supplies General Alger, then Secretary of War, appointed Mr. Hecker Government Director of Transportation, and the order which came of the chaos, under his administration, indicated to the President the man for one formidable necessity confronting the Commission.

Colonel Hecker is the only distinctly business man among the seven, and from top to toe he is the personification of executive ability. He is tall—fully up to the six-foot limit—rather thin, with close cut gray hair and beard, quick moving eyes, and nervous in action. He speaks rapidly and always to the point. He has little time to waste. He receives one with a set smile, indicating a lack of any immediate ill-will rather than a surplus of cordiality. He makes a quick dive for the depths and details of anything in hand, and, before the intruder is aware of it, he has grasped the entire situation perfectly, and with the same smile is passing him on.

Colonel Hecker is a typical American business man—excellently well groomed, by the way—offsetting the encroachments of age by absolute correctness of dress. He is apparently the right man in the right place; for the transportation of men and supplies, for some years to come, will form a vital factor in the progress of the canal.

The law under which the Commission is formed provides that four of the members shall be skilled in the science of engineering. Practically all but Colonel Hecker are expert engineers, but the four remaining members are those appointed directly to follow this provision. The only opposition which has appeared to any of the members was presented against Mr. Benjamin M. Harrod, of Louisiana. It resulted simply in provoking a more careful scrutiny, which fully satisfied the President that the charges were not such as to prevent him from placing entire confidence in the appointee.

Mr. Harrod is another tall man, with thick brown hair, slightly gray, and a full beard. His voice is particularly low and soft, tho he is broad shouldered, deep chested and heavily built. He is unobtrusive and retiring; when forced to the front he is markedly deliberate in his motions and slow of speech—a typical Southerner, of the broad-brimmed-black-felt stamp, and, in moments of relaxation, is much inclined to unbutton three or four of the lower buttons of his waistcoat. But in achievement his past speaks for him; and of all the commissioners he has seemed, in his quiet way, to have the vast problem exceptionally well in hand.

Physically the shortest member of the Commission is Mr. Carl Ewald Grunsky, of California. He is only about five feet eight; among the giants he appears even shorter. The man bears out his name in suggesting an origin in the north of Europe, being thoroughly blond—and even in the cut of his hair and beard. One instinctively expects at least an accent when he speaks, and is almost shocked to find an American of Americans, with only the accent of the cultivated Californian, in an especially precise and punctuated style, which it would be very difficult to misunderstand or misinterpret. Like most celebrated engineers, he carries the same precision and attention to details into all of the minor concerns of life. No one could be more agreeable to meet if properly approached. He gives kind-eyed consideration and is one who will secure cordial co-operation in his share of the great work.

Prof. William H. Burr comes to the Commission well stocked with information gathered in the previous investigations of the former Isthmian Commissioners. He is the sanitation expert and brings, besides, extended experience in Cuba to aid him. Incidentally of interest is his statement to the House Committee that he believed that the Canal Zone could be made thoroughly sanitary, both for

workmen and residents, for $2,000,000. He is a scientist without inconsistencies—as scientific in appearance as in fact. He looks the student. Like all scholars, he is cordial and pleasant while his patience lasts. He is tall, with brown hair and a sandy beard scientifically pointed. He has a low voice that is especially attractive, but he always seems reluctant to use it in expressing opinions. When forced to, however, he knows his own mind and is ready to fight for his convictions.

Every one knows Mr. Wiliam Barclay Parsons, Chief Engineer of the Rapid Transit Commission of New York and professional adviser of the British Royal Commission on London Traffic, and no one doubts his champion ability to dig a ditch for transportation purposes. He is only a little taller than Mr. Grunsky, but his broad forehead and heavy brows, his keen eyes and vigorous mouth, emphasized by the close-cut hair and beard, compensate for any lack in length of limb among the giants.

Mr. Parsons is a thoroughly ideal engineer. His voice is low but convincing. His dress is immaculate. He is rather thin, but muscular, quick in every motion, obviously ready for any emergency.

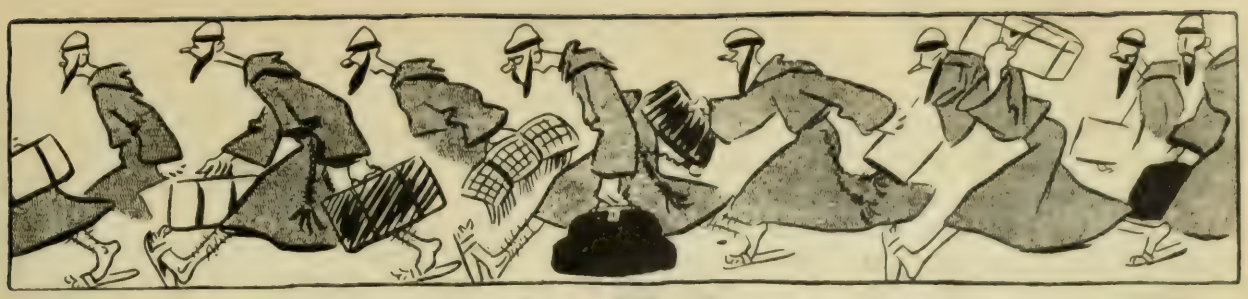
The Commission met in Washington, for the first time, officially, on the 22d of March, and sailed for Panama for initial investigation and preliminary measures on the 29th, giving little time for deliberate consideration of details. It will return on the 10th of May.

The present intention is to establish permanent headquarters in the Canal Zone, where at least one of the commissioners will be constantly on duty; but a permanent office of the Commission will also be maintained, as at present, in Washington.

The Washington office is now in charge of Mr. S. E. Redfern as Secretary *pro tem.* He was Disbursing Officer of the former Isthmian Canal Commission.

Several newspapers have stated that Mr. Edward C. O'Brien, of New York, had been appointed Secretary; but it is stated that this is a mistake and that no appointment has yet been made.

WASHINGTON, D. C.



Casa Grande

BY GEORGE LAWRENCE SPINING

"Congress has made an appropriation of $2,000 to place a roof of corrugated iron over Casa Grande."

In the wilds of Arizona there's an ancient people's land,
Land of ruins over mesas, cañons, cliffs, and desert sand,
Crumbled towns and habitations, hearthstones of unnumbered hosts,
Débris of forgotten nations, nations turned to dust and ghosts.
Grand canals, the life and glory of a desert once in bloom,
Lava-filled, now tell the story of a dreadful day of doom—
Doom to dwellers on the housetops, and to grinders at the mills,
Doom to toilers midst the field crops, and to shepherds on the hills—
Day when roaring hills and mountains shot the heavens with ashen rain,
And from burning streams and fountains fiery serpents swarmed the plain.
Now, when midnight hides the mesa, lowly voices in the gloom
Chant the redman's mournful saga of an ancient people's doom.
Massive, roofless, and forsaken, wreck amidst this arid strand,
Lightning scarred and earthquake shaken, stands the ruin Casa Grande.
Lofty walls without inscription, builders vanished in the skies,
Darkness deeper than Egyptian veils their secret from our eyes;—
Mystery to bards and sages, Sphynx of Western Wonderland,
Wreck of prehistoric ages, whence art thou, O Casa Grande?

SOUTH ORANGE, N. J.

How the Friars Went to the Philippines from Spain
From the "Alma Española," Madrid

The Aglipay Schism in the Philippines

BY JAMES A. LE ROY

[Our readers will remember the significant article we printed last October by Archbishop Aglipay himself. It was the first and only article that the Archbishop has written for publication in the United States. The following article by Mr. Le Roy gives some later facts concerning the schism.—EDITOR.]

VARIOUS opinions have been held as to the wisdom or the practicability of Protestant missionary work in the Philippines. Primarily, the burden of really initiating the Filipinos into Christian morals and faith rested upon the Catholics of the United States, and the Filipinos were certain that, once really made aware of the nature and extent of this burden devolving upon them, American Catholics would introduce in the Philippines a religious *régime* quite distinct from that of the Spanish friars.

Nevertheless, the Protestant organizations of the United States decided almost at the outset to enter the Philippine field. Time will show the wisdom or unwisdom of this attitude. Just at present, however, there are indications that the Protestant campaign in the islands will make itself felt less through the entry of natives directly into the folds of the denominations now proselyting there than through its reflex influence upon the schism in the Catholic ranks, which has been organized and managed by the natives themselves. The "Independent Philippine Church" pretends to be an "Apostolic Catholic Church," except in the one matter of refusing obedience to the Pope at Rome. During the year and a half in which it has been at work, however, it is significant to note to what an extent Protestant ideas of organization and even of ritual and doctrine have crept into it. The data are now at hand for a comparison upon these lines in the columns of the official organ of the new church, which publication is called *La Iglesia Filipina Independiente, Revista Católica* (The Independent Philippine Church, a Catholic Review), published weekly since last October.

The schism was first proclaimed on August 3d, 1902, in a meeting arranged by the Workmen's Union, the organization through which Isabelo de los Reyes had begun his semi-socialistic propaganda, which was rather more than suspected of being primarily an anti-Government agitation, regardless of proclaimed principles. The feasibility for his ends of an anti-friar agitation, which should assert as a *national* cause the rights of the native clergy, may readily be seen. Reyes had associated with him certain of the more independent native priests, chief among them the excommunicated Father Aglipay. Reyes, however, was more radical than his chief associates, who, after the former had flung his defiance of the Catholic Church to the winds, took counsel of prudence and did not at first care to go to the extreme of proclaiming their rebellion against the authority of the Pope. Aglipay sheltered himself with his old advisers, the Jesuits, who, of course, counseled submission; and Reyes was left to conduct what schism there was for nearly two months as an adjunct to his agitation among the proletariat (which at about that time landed him in jail). Aglipay's brethren among the native clergy of North Ilocos have always been the most independent-minded of their kind, and it was here that

the schism finally was formally launched early in October as a definite anti-Rome movement among the native clergy, one of their number being consecrated bishop. The formal inauguration of the new Church took place in Manila on October 22d, 1902, and shortly thereafter its campaign produced the disturbances in parishes near Manila, wherein mobs of the people undertook to dispossess the friars of churches held by them. That necessitated active Government interference, to maintain order, and a *modus vivendi* was finally created, under which such questions were relegated to the courts, while Governor Taft maintained for some time a campaign of instruction as to the meaning of the separation of Church and State.

While the native priests were still hesitating as to whether or no to launch their new propaganda as an outright schism, Reyes had been, as usual, busy of word and tongue. His and Aglipay's two "epistles" were afterward adopted by the organization as the first of the "Fundamental Epistles" of the new Church. Number 1 deals with the question as to how the first bishops of the Church could be ordained, and was put forth after much discussion and much consulting of canonical law and history on the part of the native priests, then in the background. It is interesting to note how the Filipinos disposed of this ecclesiastical question which has arisen to make trouble more than once in the history of Christendom. There was some talk of asking the Greek Church to extend its protection to the Philippines, or of having the new bishops go to be ordained by Greek or Russian bishops, as well as of making similar application to the Anglican or other Protestant bishops of the Orient; but this was rejected as being merely the "seeking of new masters," after having declared freedom from Rome. Hence it was announced that the first appointees as bishops in the provinces could gather the curates of their districts, to the number of twelve, or, in their default, that three presbyters would serve to make the ordination valid. These were the reasons given: (1) The apostles did not prescribe any ritual for this consecration, the will of the particular congregation sufficing of itself; (2) none of the apostles nor of their immediate successors was consecrated as bishop, and the same was true of the Protestant and schismatic prelates, in the beginning; (3) it is agreed that Jesus Christ, who consecrated the apostles, was a bishop, but the presbyters are also living representatives of our dear Redeemer; (4) the presbyters are as completely priests as are the bishops, many authors maintaining that bishop and presbyter mean the same thing (hence if, in case of necessity, a layman can administer the first sacrament, that of baptism, certainly, in like case of necessity, a presbyter can administer the sixth, that of ordination).

The second Epistle was mainly an appeal to the anti-friar sentiment of the people, in a reply to Acting Archbishop Alcocer's anathema uttered against the schism. The words quoted from Bishop Alcocer are worthy of note:

"With the change of political domination there have entered these islands new classes of people, the zeal for proselytism, the desire for false liberties, immorality, superstition, impiety, scandals and false reports about Catholicism."

Thus far the new Church had made no announcement as to doctrine, except that it would retain the same dogma as that of the Catholic Church. Something besides a mere renunciation of obedience to the Pope was, however, implied in the rather rambling Epistle III, which touched in a general way upon questions of faith. Along with orthodox Catholic disquisitions as to the nature of Divinity there went such a statement as:

"Once having valorously thrust off the burdensome religious servitude of four centuries of mystery and medievalism, let us also have the virility to think with our own minds . . . with the natural reason which we have received directly from the generous hands of the Creator."

The worship of the saints and of the Virgin is not to be relegated, but they shall not have place before the members of the Trinity itself. Outlining the sublimity of a conception of God based upon modern science and its revelations as to the universe, the Epistle says:

"Calmly compare now, dear brothers, the sublimity of these profoundly great and venerable ideas about the true God with the overwhelmingly gross paltriness of the absurd marvels that are attributed to the miracle-working saints, like the wandering one who, showing

his repugnant ulcers, is said to cure the pest; the holy friar who brings back lost things and provides sweethearts . . . and other superstitions which, at the cost of the gravity of our holy religion, the Romanists have invented."

And a little further along Protestantism spoke quite plainly thus:

"Instead of certain books of religious exercises wherein abound so many impostures and attempts at erotic declarations to the female saints, written by lazy, neurasthenic friars fasting from flesh, give to the faithful the immortal and only Book of God, which is the Bible, wherein they will learn to adore him as they ought and to follow rules of life adjusted to the desires of our Creator and to the laws of nature, contrary to which we can never go."

In Epistle IV of October 29th, 1902, the idea of lay participation in the work of organization and management of the Church, as well as in its propaganda, was outlined. The scheme comprised provincial or diocesan committees (the schismatics have been appointing a bishop for each province as fast as they could effect a working organization in it) and parochial committees, one of men and one of women (the women of the Aguinaldo family were especially prominent in the work of propaganda in Northern Cavite). These committees were, in fact, frequently organized before the native priest of a locality came into the new Church, if he came at all; and one of the things enjoined upon the lay committees was that they should strive to win over the local priest. The charge was made that native priests who have, since the friars were driven out or imprisoned in 1898, presided over the parishes, great as well as small, have been required to give two-thirds of the fees and tithes of their parishioners to the friar-hierarchy at Manila. Another aim of the lay committees should be to get possession of the local churches, on the ground that they were built by the public's labor and contributions and on land belonging to the state. These committees were more precisely organized in October of 1903, and one of their duties is to build churches where the Romanists remain in possession of the traditional edifice, and to see that they have a deed to the land and building and have it properly recorded.

This Epistle also outlined a plan for the rapid ordination of young candidates for the priesthood, after proper proofs as to character and an examination on "the Bible and simplified theology;" they were, however, to continue their studies after being ordained, and to be examined at intervals. Each bishop is now supposed to organize a seminary in his diocese, and such seminaries are in quite active operation in Manila and several other places.

The next Epistle was a direct attack on the Pope, in answer to his bull on the Philippines, issued in December, 1902. There was plenty of material in the bull to warrant the claim that the Papacy intended to keep the friars in the islands, and the fullest use was made of these passages, in an appeal to the popular feeling against the friars.

By February, 1903, the bishops of the new Church already numbered more than a dozen, and the "Supreme Council" had been organized, and during that month put forth the "Doctrine and Constitutional Rules" of the Church. The first part contains the doctrine. Chapter I declares the object of the Independent Philippine Church to be as outlined in Epistle III, stress being laid upon the restoration of God's "most holy Word" in the worship of Him, and upon the necessity for freeing consciences from all "anti-scientific scruple against the laws of nature;" furthermore, the aim is announced to "reconquer the rights and prerogatives of the Filipino priesthood." Chapter II contains an orthodox pro-

How They Lived in the Philippines

How They Left the Philippines
From the "Alma Española," Madrid

fession of faith in one God and in his manifestation through the Trinity, which is characterized by a phrase that recalls the days of the Filipino Masonic propaganda:

"As the triangle is the symbol of solidity or of power, of straight lines or of beauty, so in the Biblical Trinity we see symbolized all the perfection of God."

Religion, rightly conceived, is declared to be too serious to countenance image worship, and the necessity for perfecting the individual intelligence so as to comprehend the Divinity is reiterated. These declarations of the chapter in question are noteworthy:

"The immortal and only Book of God is the Bible, and in it we ought to learn to worship him as is fitting; to glorify him, as we see in the Psalms; to pray to him as the Divine Master himself teaches. And in the Bible we find also salutary rules of life, both private and social, rules that will bring us well-being as well in this life as in the next.

"In all that is not contrary to the pure Word of God, to Nature, to the Sciences and to right reason we follow the same beliefs as the Romanists."

Worship and rites, declares the next chapter, shall be the same as those of the Roman Church, "except where it has falsified the Biblical teachings with simoniacal and deceitful ends in view." In the temples the Protestant practice of having all seated should be followed, instead of having the women squatted on dirty floors, often covered with saliva. On the altars the "saints and Virgin are to be put at one side, and the symbols of the Trinity in the center." The priests shall give especial attention to the reading of the Bible in the services, for which purpose the Book of Job is particularly commended. Prayers are to be "short and simple," and not made up of the useless repetitions of Ave Marias, "which excites the imagination, stifles fervor and induces sleepiness." The special festivals in honor of saints are not condemned, but more particular pains should be taken to celebrate the days of the Saviour, and ten Ave Marias should not be said to one "Our Father." Prayers, moreover, should be said in the local dialect, and mass should also be celebrated in the dialect, its features being explained to the congregation as it proceeds. Among the duties enjoined upon the priest is:

"He shall disregard his own comfort, fatigue, the inclemencies of the weather and the hours of the night to hasten to administer spiritual aid to those who have need of it; he shall always treat the people with affection, and never with the harsh manners which the Roman priests are accustomed to show to our poor fellow countrymen."

The rules of life, as laid down in Chapter IV, are that we follow primarily the commandments as they were interpreted by Jesus. Charity to our fellows is the first duty, and these rules of life are for all the days of the week, as well as for Sunday. Another duty of man is to perfect his intelligence. We should practice and defend "philanthropy, justice, honor, liberty, labor and the sciences." The dignity of labor is proclaimed, as it is the "inexhaustible fount of well-being."

The second part of the document consists of the rules for the government of the Church. The Bishop Maximus (Obispo Máximo) is to consult with the Supreme Council on all important matters, this council being composed of bishops and certain selected presbyters, nominated by the Bishop Maximus. He himself is to serve but four years, and his resignation may at any time be demanded by the "General Assembly" of the Church, which shall also always be called to elect to this highest office, as well as

to alter the doctrine and rules of the Church. This Assembly is to comprise all the bishops (now some seventeen or eighteen), an elector chosen in each parish by the parishioners, a similar elector for each diocese chosen by the chairmen of the lay committees, and an elector for each seminary chosen by the students.

The parish priests of each diocese shall submit a list from which the Bishop Maximus shall choose the bishop of that diocese. In turn, the bishops appoint priests to the parishes "upon competitive test." There shall be diocesan councils of priests to consult with the bishops. The lay committees in turn are to work with the priests in each parish. The committees of men are to be composed of thirty or more, one being appointed to watch over each group of fifty to one hundred families, attend to collection of parochial contributions among them and to the distribution of aid in case of necessity. The women's committees are to devote themselves primarily to charitable work. The priest keeps the fees for marriages, deaths, etc., as his personal perquisites; the parish contributions are to be divided according to the rule laid down by the bishops, and rich parishes are to help out the poorer. The lay committees may inspect the books and have an investigation of accounts when desired; but the priest is to be considered the financial administrator, subject to these checks.

The interesting feature of this part of the document is its proclamation of communism as the ideal of the new Church. The "abolition of property and the communism of possessions" was proclaimed by Jesus, yet had only made progress in notable degree during the past century; hence, the new Church, while holding this as its ideal, must yet not attempt "to put it into practice at one blow." This last is plainly a feature introduced into the document by Isabelo de los Reyes, who picked up among the socialists of Spain and Italy the ideas upon which he has been seeking to arouse the Filipino proletariat. He, however, disclaims full acquiescence in the "Doctrine and Constitutional Rules" as they stand, as he declares himself to be in favor of the marriage of the priests and of the abolition of the confessional, and to have no belief in hell. The Supreme Council has discussed at various times the question of permitting priests to marry, and the Filipino sentiment in its favor is quite strong; but it has always been rejected, largely upon the ground that the cry would be raised that it was for this that the native priests had joined the schism.

The weekly organ of the new Church is edited by Isabelo de los Reyes, who has been both more cautious and less talkative since he was released from jail last year by Governor Taft with a pardon message which set the country to laughing at him. The comments of the Protestant misisonaries, especially upon Romanism, are frequently reproduced, and there is an evident spirit of fraternization between the schismatics and the Protestants, aside from the connection of one or two of the Protestant missionaries with the new movement as advisers. The late numbers of the weekly in question make the most of the attitude of the new American bishops, Rooker and Dougherty, in attempting to oust the schismatics from churches they held and in pronouncing words favorable to the friars.

DURANGO, MEXICO

Grand Duke Cyril of Russia

The Grand Duke Cyril, who escaped almost miraculously when the "Petropavlovsk" was blown up off Port Arthur, is the son of Grand Duke Vladimir, the uncle of the Emperor. He was born in 1876, and is a brilliant young officer and a very charming personality. The democracy of his character was well shown during his visit to New York, in 1898, when he helped to found a club for the small Russian colony, presenting it with an autograph portrait, which we reproduce. The inscription reads: "V. K. (Veliki Knyaz, Grand Duke), Cyril Vladimirovich ('son-of-Vladimir'), to the Club, New York, 1898." The Grand Duke Cyril is heir to the throne after the Grand Duke Michael, the brother of the Czar, as it is understood that the Grand Duke Vladimir will waive his right in favor of his son. At the time of the explosion Cyril was standing on the bridge with Admiral Makaroff. He was thrown by the shock to the port side of the bridge and lowered himself to the deck, where he was swept under by a wave. On rising to the surface he caught a floating fragment of the "Petropavlovsk's" steam launch, to which he clung for ten minutes, until he was rescued by the destroyer "Bezshumi." He was badly burned and bruised, but is recovering.

The Disasters of the U. S. S. "Missouri"

BY PARK BENJAMIN

TO the "Missouri," the newest of our battleships, two serious disasters have recently occurred which have aroused much public apprehension.

The "Missouri" is a great ship of 13,900 tons. She is 388 feet long and carries 551 men. She has four twelve-inch guns besides sixteen of 6-inch caliber and many smaller pieces, all of the latest pattern and designed for smokeless powder. She is protected by 2,900 tons of armor, propelled by twin screws, and can steam 18 knots per hour. These were the disasters:

I. About two months ago, while performing evolutions at sea with the rest of the battle ship squadron under command of Rear-Admiral Barker, and while 500 yards distant from and in line abreast of the "Illinois," the "Missouri" suddenly swerved toward the latter vessel, with which she apparently would have collided had not the "Illinois" quickly changed course. The result was that the "Missouri" fell back out of line. In endeavoring to regain her position under increased speed her steering gear unexpectedly broke down, leaving her rudder jammed hard over and immovable. Again she turned toward the "Illinois," and altho she backed her engines with all their power, the cutting down and sinking of her sister ship would have apparently followed had not a dexterous manipulation of the helm of the "Illinois" sharply swung that vessel around the "Missouri's" bow. The ram just missed the "Illinois's" side, but caught on a protruding propeller shaft, broke the propeller and drove the supporting studs into the ship's bottom, making holes through which the after compartments became flooded, and doing other injury sufficient to require a long stay of the "Illinois" in dry dock and many thousand dollars' expenditure.

A Court of Inquiry exonerated the captains of both the "Missouri" and the "Illinois," and recommended that no further proceedings be had. This finding has caused some criticism, which reduces itself to the three following questions:

1. Why, before any impairment of her steering gear had taken place did the "Missouri" suddenly swerve down on the "Illinois" and compel the latter to avoid her?

2. Why, after the breakdown in the steering gear had occurred, did the "Missouri" not control herself, as twin screw steamers constantly do, by suitable manipulation of her twin screws?

3. Why, after her steering gear had broken down, did she not resort to other steering gear, if present, in order to control her rudder?

The official answer to the first question is that the deviation of the "Missouri" was due to bad steering on the part of an unskilled helmsman; and that, altho the captain and the officer-of-the-deck were in his immediate vicinity, it was impracticable for any of them to prevent the ship from traversing the intervening distance of five hundred yards to the "Illinois" and putting the latter in imminent peril. It is said that there is difficulty in controlling these very heavy ships by the helm, and that much skill and experience are necessary. As an explanation this leaves much to be desired. Unskilled hands are not placed in charge of important machinery on shore. There were over 500 men on the "Missouri" to choose from.

The answer to the second question is that, altho it is well known that ships having twin screws can be steered by them only, and that this is constantly done by merchant as well as war vessels, and was done by the "Variag" in her recent fight with Admiral Uriu's squadron after her helm was disabled, nevertheless twin screws practically lose their directive action when the rudder is jammed hard over and when a ship is

making a speed above 5 or 6 knots. This theory, while strongly affirmed by officers who have had command of battleships for considerable periods of time, and who claim to have proved it by repeated trials, is disputed by others. No attempt appears to have been made to use the twin screws to check the turning of the " Missouri." On the other hand, it is insisted that the knowledge of her Captain that any such expedient would be futile, the brief time at his disposal for taking any action, and the fact that his prompt backing of his vessel was really the best thing to do, meet all criticisms.

As to the third question, there was no second and independent steering gear on the " Missouri " which could be instantly resorted to in case of failure of the one in use. It is thought better, rather than to multiply mechanism, to rely upon acquired skill in the use of the single apparatus. This position is strongly assailed and, in the writer's opinion, is not well taken.

In further explanation of the existing conditions it is pointed out that the " Missouri " was only recently commissioned, and that neither her officers or men had had time to become familiar with the working of their ship. It is reported that on the morning of the day when the accident occurred her Captain had requested permission to go to sea alone in order to make trials of her tactical qualities prior to the fleet evolutions, and that this request was denied. On the other hand, it is said that numbers of already skilled men had been drafted from other ships to the " Missouri," so that the state of her crew was far from one of entire " greenness." If, as is claimed, her people were unskilled in her management, a satisfactory explanation is yet to be offered why she should have been permitted to take her place in the line and so have become a source of danger to the ships maneuvering with her, especially at the close distance maintained under the trying conditions of squadron practice.

II. The second disaster not only imperilled the " Missouri ' herself, but every soul on board of her, and resulted in the killing of thirty-two men, including five officers, a loss of life greater than that sustained by the navy in the entire Spanish war.

It took place while the crew were engaged at target practice endeavoring to make a record for speedy firing with the heavy guns. Three shots had been fired from one of the 12-inch guns in the after turret. The projectile, weighing some 860 pounds, had been inserted in the bore and two of the four cartridges of smokeless powder weighing 90 pounds each had followed it. While the third cartridge was being placed the powder suddenly ignited. The flame, besides filling the turret, passed down the passage through which the charges are hoisted from the handling room below, which is immediately adjacent to the magazine. The cartridges which were coming up were ignited in turn, and these communicated fire to other cartridges in the handling room, so that in the end some 1,600 pounds of smokeless powder was set on fire. The men and officers in the turret and handling room were all killed. That the magazine was not blown up appears to have been due to the extraordinary presence of mind and heroism of the gunner's mate stationed therein, who instantly stopped the opening through which cartridges are passed out with an empty copper cartridge case and his clothing.

The Court of Inquiry is at the present writing still engaged upon its deliberations, but sufficient information is at hand to make it most probable that the accident was due to burning material left in the gun after the firing of the third shot. In the old muzzle loading guns explosions from this cause were not uncommon. They were prevented by careful sponging out of the bore between shots. With guns which open at the breech it has been customary to wash out the powder chamber with a stream of water from a hose, but in the later types of guns, where the powder chambers are contracted at both ends so that water would be retained in them in considerable quantity, this is hardly practicable. Hence, altho some navies, the Japanese in particular, still continue to wash out their guns, others content themselves with a fan-blast of air, and where fast record firing is going on there is a strong tendency to omit any cleansing at all.

It has been generally recognized that the chief source of premature ignition of powder in the gun is in the material of which the cartridge bag is made. In

our navy these bags are of ordinary unbleached muslin, mainly in a single thickness. As this is of loose and weak weave, and, besides, thin, a few bands of woolen tape about an inch wide are passed around it, in order to support the weight of the powder. The wool is not as certainly combustible as the cotton is, and for that reason is objectionable, but it has been thought that the small amount present would be wholly consumed under the intense heat of the explosion. Some difficulty has been found in rapidly introducing these bags, owing to their looseness, into the gun. When shots from 12-inch guns are fired at intervals of about 35 seconds apart, it is hardly necessary to say that fractions of seconds count. Sailors are proverbially rich in expedients, and under the great stress of active competition they are abnormally heedless of danger. It is known that they have repeatedly bandaged cartridge bags with many turns of this woolen tape so as to make them stiffer and behave more like the metal cases of fixed ammunition, which is easier handled. It is also known that a short time before this disaster the "Missouri" received a thousand yards of woolen tape. As cartridge bags are supplied to ships, and not made on board of them, the inference that the extra tape may have been used in the manner stated is not unreasonable and would account for the burning residue.

Plainly the grave public interest in these occurrences really concentrates itself in one question, and that is, Were they true accidents, or were they symptoms of deterioration in the discipline and efficiency of the navy? In the opinion of the writer, there is nothing symptomatic about them, nor anything which, apart from the immediate distressing results, should give rise to any serious public apprehension. The modern battle ship is practically a new tool. It cannot be manipulated with safety until skill in its use has been attained.

Every new machine involving great forces kills people who are learning to use it; this is true of all engines, trolley cars, automobiles, elevators, firearms, electrical apparatus and so on through a long list; and of all human contrivances the modern battle ship is the most complex.

In foreign navies there have been many accidents. In 1893, for example, the British battle ship "Camperdown" rammed the battle ship "Victoria" while practicing fleet evolutions, and sank the "Victoria" instantly with all on board. Premature explosions have repeatedly happened. The marvel is not that we have such accidents in our navy, but that there are so few of them. That the two "Missouri" disasters should reveal, after the event, possible errors or omissions, for which complete explanations cannot immediately be framed, is to be expected. To imagine otherwise is merely to counsel perfection which fallible humanity, whether in the navy or out of it, has not yet succeeded in attaining.

Much has been said in the public press concerning the strenuosity of the present target practice, and fear is expressed lest the intense rivalry which has been created between different vessels of the fleet in the effort to increase the speed of firing should result in peril. It is not improbable that in some instances the margin of safety has been exceeded. But in what great competition has this not occurred?

It may seem an obvious conclusion, but the nations of the world have been a long time reaching it, that shots which do not hit their target are thrown away, and that no war was ever settled by paving the bottom of the ocean with projectiles. The ship which first plants an effective projectile in the vital part of her adversary is the one which wins, and David Harum's perversion of the Golden Rule, "Do unto the other feller as he would like to do unto you, and do it *fust*" is the controlling precept of modern warfare afloat. Firing that is both rapid and accurate is absolutely essential to the national safety. It cannot be attained without practice and the skill that comes from practice. Wars cannot be waged without killing men, and so long as that fact exists there is little difference between killing men during the process of teaching and during the process of fighting. Life is sacrificed for the country exactly as much in one case as in the other.

Nor are these disasters without their reassuring side. Their lessons will certainly be heeded. The collision will result in immediate review of all the means

for steering and of the question of providing additional and independent steering gear. No more "green ships" will be ordered immediately into squadron formation. The new vessel after joining the flag will be directed to drill alone until she becomes proficient in individual maneuvers, and even after that she will be required to drill with another ship until the two unitedly are tactically as controllable as any other two in the fleet.

The explosion will cause an immediate investigation of the material used in making cartridge bags, and probably a demand upon the inventors of the country to find some strong fabric which will be certainly totally consumed by the fire in the gun. All safeguards will undergo renewed scrutiny and additional provisions against carelessness or error will follow.

No accidents of this sort in the United States Navy ever go unheeded. The public may hear little about it, but the introspection will be thorough and complete.

Lastly, the country may congratulate itself upon the way in which the officers and men of the "Missouri" met this terrible strain. Their behavior was magnificent. There was not the slightest failure of discipline in any particular. If the enlisted men were "green" they acted like veterans. Every expedient for safety, even when the self-destruction of the ship seemed inevitable, was coolly and promptly applied. The cases of individual gallantry were not only many, but such as to elicit an instant expression of admiration from the whole fleet.

NEW YORK CITY.

Remember

BY LOUISE DUNHAM GOLDSBERRY

IT was long ago; before the world and you and I grew old. Do you remember it? The pimpernel-edge of the long path in from the street? The fringe of coxcomb and snapdragon and bachelors' buttons? And larkspur? And the droop of touch-me-not bells, the fleck of flame where the poppies grew?

There was a kitchen window. Remember? Where the dew-plant distilled coolness and the ice-plant exuded lucent crystals? The kitchen window, where a winesap tree kept tip-tapping like a bare, brown ghost against the frost-bound pane in winter, dropped petals and bore fruit? Such fruit! white with a blush in it, and velvet crimson skin.

Lush grass? You never heard the word, but the bumble-bee and you knew the sweetness of white and rosy clovers, and the infinite fleet of burst milkweed pods and thistle floss sent adrift. And knew nothing softer was than those tangles of grass wove in the wind's loom and spun with dreams.

And such dreams! Divinely incoherent, with the cricket's fiddle-strings atune and the snap of grasshopper and all the unutterable stridulation in the grass, and pulse of the earth-heart under your own.

Tymbal and flute and wee bassoon—that infinite insect orchestration thrumming through lazy noons. Right under your prone idle head and overflowed heart, with a thousand notes and meadow latration and thin, sweet iterancies.

The persimmon tree—*the* persimmon tree stood alone in a mellow field, atop of a green knoll. Raccoon and you worshiped there in pagan cajolerie, after frost nights. When the Big Dipper spilled hoar-spangles and the grass matted and wrapped in the sappy roots in withered wimple and the winter stars strung the horizons. The blacks up road never bothered that tree; they had caught

the vague ends of prehistoric tattle and they knew of a sureness that every night the bones interred in that mound set themselves to their sockets and danced all night around the persimmon tree.

But you? Oh, you and raccoon, that first night when the frost seared the rinds! Shut your eyes, and you can hear the dropping of nuts back in the star-lit woods. Just now and then a patter against dead leaves, and the owl's *whoo-whoo!* And feel that delicious shiver of daring and fear creep down your spine. And taste the sweet pucker of that first persimmon as your fond tongue clove to the slippery seed and sucked nectars from the frost-burned skin and your greedy fingers pringled with thorn-pricks!

The wild plum thicket, too, across the gossipping brook. A dingle out of eye-reach from the road. A great snow-burst in spring. Ah, I thought so—you smell a whiff of its breath that strangles you with its memoried sweetness! Where the winds blow in from your boyhood and lave you like love's lustration. Pieded juicy plums, that were your honest spoils from the woods.

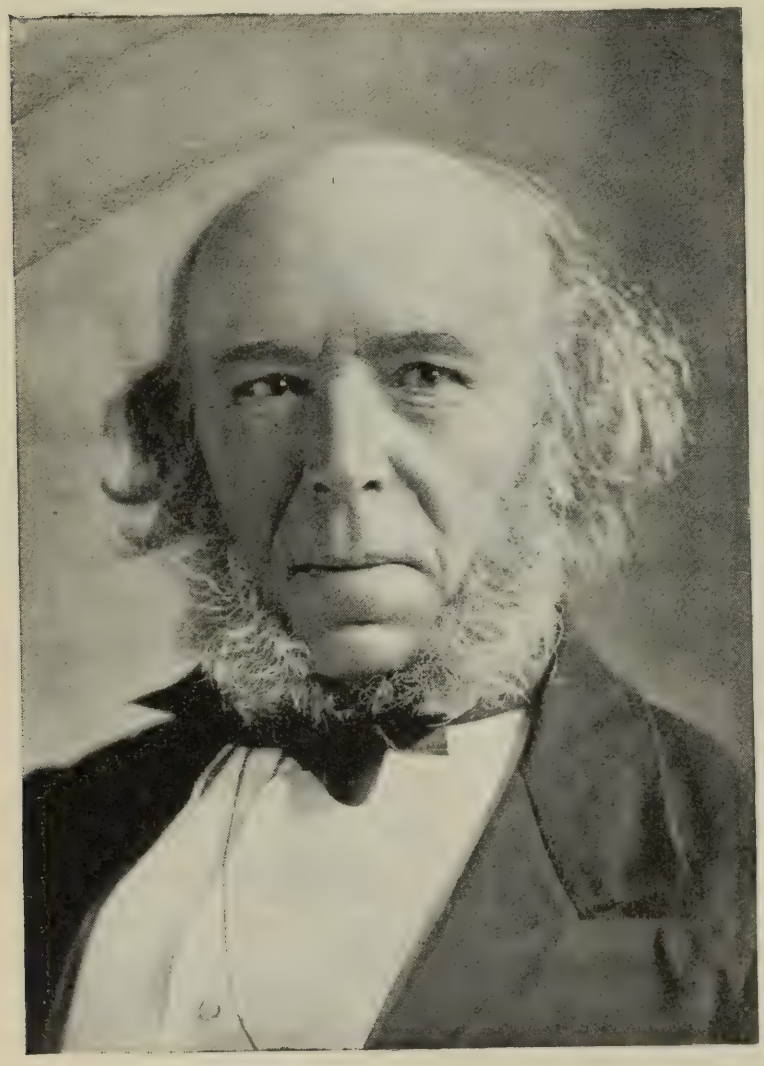
How many times of a summer day did you cut your lips on new sugar-cane? And your fingers, till they were seamed like an old dame's cheek? And how many partridges did you smuggle into the shed when you stumbled into a nest in the buckwheat field? And did not dare mourn their loss to mother, when the cat got them; you knew she would look sorrowfully out of those sweet dove-eyes. And somehow you remember how she used to call the buckwheat field the jasper sea when it went into waves with the wind's ripple, and the Bob White whistled bonnily out of its deep.

And the walnuts! Never knight wore scars gaylier than you carried your two stained hands. All of a fall afternoon you sat against the sunny side of the shed and hulled those walnuts, pounding them between two stones. With the pungencies of the spirting juices in your nostril and heart a-big with pride in the wet-coated heap drying their yellow-green shag into wind-burnt brown.

Remember? Before the world and you and I grew old?

WASHINGTON, D. C.

The Autobiography of Herbert Spencer



BY FRANKLIN H. GIDDINGS, LL.D.

[The following appreciative review of the "book of the year" is by the Professor of Sociology in Columbia University. We are pleased to announce to our readers that next week we shall print the first of a series of three articles all made up of hitherto unpublished letters of Herbert Spencer. These letters were written by Spencer to friends in America, and most of them deal with the charges made by Henry George in "A Perplexed Philosopher" that Spencer recanted his views on the land question out of deference to the English aristocracy. These letters are bound to cause wide comment, not to say controversy.—EDITOR.]

WITH the publication of the Autobiography* of Herbert Spencer the world has learned the full story of the lives of three men, who wrought in the nineteenth century the most complete transformation of human thought since recorded history began. It is a story told for the most part by these men themselves. The "Life and Letters of Charles Darwin," not only contained an autobiographic chapter, but also revealed the career and character of the man so largely through the medium of his letters that the whole work was essentially his own account of himself. It has recently been supplemented by two more volumes of letters. "The Life and Letters of Thomas Henry Huxley," in like manner, gives us a picture of the man that is on the whole a self-delineation. The Spencer Autobiography is frankly a personal narrative and self-analysis. It includes but few of the author's own letters. It is throughout a self-conscious production, which the Darwin and Huxley memoirs are not.

* THE AUTOBIOGRAPHY OF HERBERT SPENCER. New York: D. Appleton & Co. 2 vols. $5.50.

Partly for this reason, and partly because of the greater range and constructive magnitude of Mr. Spencer's intellectual achievements, his Autobiography is a more important work as a contribution to the history of evolutionist thought than the lives of Darwin and Huxley. It is also something besides. Beyond any reasonable doubt it is destined to take rank as one of the two or three most remarkable self-portrayals of a human life ever committed to posterity. Those friends of Mr. Spencer that have for some time been familiar with its contents have not been guilty of exaggeration in leading the public to expect a work comparable in its unsparing frankness with the "Confessions" of Rousseau, while differing from that work, as the heavens from the bottomless pit, in the character of the truths that candor had to make known. The only other autobiography that can be put in the same class with these two works is that of Benjamin Franklin.

Herbert Spencer, Age About 45
Courtesy D. Appleton & Co.

These facts mark Mr. Spencer's Autobiography for enduring pre-eminence. As if this were not quite distinction enough, however, one further circumstance makes it unique among human documents. Throughout his career as a philosopher Mr. Spencer loved to insist that we can size up the minds of men and women by observing the ratio that generalities bear to personalities in their conversation. He exhibited a fine scorn of that popular historical writing which dwells chiefly on the lives and services of great men. Speaking of his own journalistic career, he gives us to understand that he did not have to spend his time in serving up popular gossip, even of the better sort. One would have expected that a philosopher entertaining such views would prefer to let his own personality fade into oblivion, or at least that he would have felt that consistency demanded that he should let his scientific and philosophical writings stand as the sole record of his existence. Yet we find him here setting forth concrete personality—his own personality—to the extent of 1,154 closely printed pages.

No other apology or explanation is offered for a performance apparently so paradoxical than the prefatory remark that it seemed to the author that a natural history of himself would be a useful accompaniment to the books which it had been the chief occupation of his life to write. And in truth no other explanation is needed. One has only to read a very little way in any chapter of these two volumes to discover that the apparent inconsistency turns altogether upon the meaning that we attach to the term personality. The reader searches here in vain for delectable gossip. There is a rigorous exclusion of insignificant information. Every fact recorded is seen to have a relation to some other fact, in the chain of cause and effect. Indeed, if Mr. Spencer's own rule were rigorously applied to this narrative, the astonishing result would ap-

pear that generalization actually occupies nearly as large a proportion of the printed space as it does in any one of the three volumes of the "Principles of Sociology" or in either one of the volumes of the "Biology." What Mr. Spencer has actually done, then, has been to look upon himself as he has looked upon any other product of cosmic evolution, and to explain himself—to write, as he says, "a natural history" of himself, as only the author of the "Synthetic Philosophy" could do it.

Whether instinct or reason prompted him to undertake the task, it is from every point of view fortunate that he achieved it. Whether or not we agree with Mr. Spencer in his estimate of the personal element in human history, mankind by and large does not live on abstractions, and even systems of philosophy would lose much of their power to appeal to successive generations if the world knew nothing of the lives and personal qualities of the men that have created them. In his preface Mr. Spencer tells us that whether or not he has fully succeeded in presenting himself objectively, one significant truth at any rate has been made clear—namely, "that in the genesis of a system of thought the emotional nature is a large factor; perhaps as large a factor as the intellectual nature." If this is true of the genesis of thought it is equally true of its survival, and, when all is said, the chief factor of our emotional nature is the sympathetic interest that centers in personality—in the story of a human life. Certain it is, therefore, that by adding his Autobiography to the long list of his philosophical writings, by revealing with astonishing candor his qualities as a human being, Mr. Spencer has made himself a far more vital influence in the future intellectual development of mankind than he could have been if his system of philosophy had been left as his only creative work. Thousands of men will catch the spirit of his thought, and be inspired by his ideals, who might never have turned the pages of his philosophy.

What, then, of this story in particular? What does it tell us of Mr. Spencer's life that we did not know before? What qualities does it reveal as characteristic and pre-eminent that we might not have suspected but for this self-conscious analysis? In one sense nothing, in another sense almost everything. The chief incidents of Mr. Spencer's career are soon told. He was born at Derby, England, April 27th, 1820, in a family that had long been closely associated with Non-conformists' movements. His parents and most of his immediate relatives were Wesleyans, strongly and narrowly religious. Most of them were intellectually commonplace, and in their tastes what Mr. Matthew Arnold would have called philistine. But, with few if any exceptions, they were distinctly superior in moral character, while his father, William George Spencer, and his uncle, the Reverend Thomas Spencer, who had much to do with Herbert's education, were men of unusual intellectual force. Herbert was the only survivor of six children, and in his childhood he associated but little with children of his own age. In fact, he seems to have been an almost pathetically solitary little chap, who acquired an introspective habit and an almost abnormal self-consciousness, when he should have been learning to take himself less seriously through experiences with boys of his own age on the playground. Detesting Latin and Greek, tho compelled by his uncle to study them, never reading books in general literature or history if he could avoid them, fond of mathematics and drawing, and, above all, of the observational study of nature, always rebelling against authority, often flagrantly disobedient, he refused to prepare for a university career, and after leaving school simply drifted into one occupation after another until, in the thirties, he began to find himself as an independent student and writer. A year was spent in teaching, eight years in civil engineering, and a year or two in editorial positions. Then, having published his "Social Statics," he found occupation for a time as a writer of essays for the leading reviews. Such was the strange preparation for the great life work that began at forty, when he settled down to arduous and continuous labor on the "System of Synthetic Philosophy."

The narrative of these years of preparation occupies the entire first volume. Of mere incidents there are many, of unusual interest and significance, which it would be worth while to mention if

space permitted. There are three that must not be passed by.

It may be doubted whether any American boy reader of dime novels, fired with a desire to fight Indians, ever performed such a feat of runaway endurance as Herbert Spencer did at the age of thirteen, when he slipped out of his uncle's house at Hinton Charter House at six o'clock one morning and tramped back to his father's home in Derby, walking 49 miles the first day, 47 the second and 20 the third, subsisting meantime on penny rolls and water, and two or three glasses of beer. As a civil engineer Mr. Spencer, beginning without a proper technical education, succeeded in holding positions of no little responsibility, and he seems to have had a degree of physical fearlessness and a love of adventure that would not have been suspected by those who knew him in his later years of invalidism. His building of railway bridges from his own designs, and under his own responsible superintendence, without interfering with the running of trains, was, in that day of railway beginnings, no inconsiderable feat for a mere youth, and his dare-devil exploit with a runaway railway car was worthy of a Wyoming frontiersman. The third incident, revealing another side of his character—which yet was all of a piece with his habitual disregard of authority and conventionality—was his comradeship with George Eliot, which, without so much as the suggestion of a love affair about it, was carried to the extent of almost daily walks alone with her, on the terrace of Somerset House, and frequent attendance at concerts and operas.

Mr. Spencer's account of these preliminary years might accurately be described as a study of the relations between heredity and education. He goes minutely into an examination of the physical, mental and moral qualities of his ancestors on both the maternal and paternal sides. The one trait that he discovers which awakens his admiration is their chronic rebellion against authority. Of the education, which, however, it may have been intended to make himself in some measure tractable and comformable to received standards, wholly failed of such achievement, he speaks in terms that show how, to the end of life, he never ceased to believe in letting each individual mind work out its own salvation, save in so far as it can be guided by an appeal to the higher emotional nature. He thinks that his father and uncle could have made him obedient and submissive to certain kinds of mental discipline if they had gone about their task in the right way. One can read between the lines also something which Mr. Spencer himself did not fully realize —that his hatred of language study and of systematic attention to literary and historical studies was quite as much a product of bad teaching by his uncle as of any inborn qualities of mind, for it is evident from his whole career that Mr. Spencer never had difficulty in mastering any subject that he became sufficiently interested in to apply his mind to.

It is in his estimates of the mental and moral qualities of his relatives and friends, quite as much as in his analysis of himself, that Mr. Spencer reveals the essential qualities of his own personality. It is a revelation that, on the whole, confirms the impressions that the world has obtained from his philosophical writings. The most striking characteristic of all these personal estimates is an astonishing combination of frank fearlessness with restraint. There is never a suggestion of exaggeration. There is neither a word of too much praise nor a yielding to the temptation to blame beyond measure. In all the annals of family biography one will search in vain for anything more righteously impartial than Mr. Spencer's portrayal of his father, a man of many admirable gifts and sterling qualities of character, but lacking in generous sympathy and kindliness. The sentence, "He was not kind to my mother," in its simplicity and terrible truthfulness reads like a doom pronounced from a throne of justice.

This quality of moderation lends the greatest weight to all that Mr. Spencer has to say in commendation of men whom he knew well. Perhaps the most interesting single instance is his estimate of Lewes. After Lewes' death scandalous tongues made free with his reputation, and even went so far as to allege that George Eliot's life with him, in later years at least, had been a disappointment. Mr. Spencer knew him intimately and through and through, and his unqualified denial of the truth of these stories may

without doubt be accepted as final. Of Lewes' character he says:

"But alike then and afterward, I was impressed by his forgiving temper and his generosity. Whatever else may be thought, it is undeniable that he discharged the responsibilities which devolved upon him with great conscientiousness, and at much cost in self-sacrifice, notwithstanding circumstances which many men would have made a plea for repudiating them."

In Huxley Mr. Spencer saw only one fault, the inability to say "no" to the ceaseless demands of all sorts of good causes upon his patience and limited fund of physical strength. To his devoted American friend Youmans Mr. Spencer awards that measure of credit and gratitude which was to have been expected.

As in his estimates of men, so in his judgments of peoples, of tendencies, and of certain ideas that have held sway over the human mind, Mr. Spencer is ever scrupulous, even when he is seemingly, from the point of view of his opponents, most dogmatic and perverse. Writing of his visit to America in 1882, he is at pains to say that, contrary to what he had been led to expect, the Americans are not intrusive. His wish to be undisturbed on account of his weariness and ill-health was everywhere respected. He was overawed when he reflected that the Atlantic coast cities which he visited were but the fringe of a vast realm stretching westward, and he predicts that America is to become the most powerful nation of the world. He greatly admired Fairmount Park and Central Park. Fifth Avenue impressed him as finer than any English street, and throughout his stay in New York he had a feeling that he ought to be speaking French, as in Paris.

No little impatience will be expressed by the devotees of an accepted "culture" at Mr. Spencer's almost contemptuous characterization of the Homeric writings in literature, of the old masters in painting, of Ruskin's judgments as an art critic, and of Carlyle as an alleged philosopher. Without for a moment claiming that Mr. Spencer was a competent judge of either literature or art, it must in justice be remarked that he always gives a reason for his own view, and that

HARRIET SPENCER
Herbert Spencer's Mother at Twenty Years. From "An Autobiography by Herbert Spencer." Copyright D. Appleton & Co., 1904.

his readers can therefore appraise it for themselves. He cannot endure Homer because "the ceaseless repetition of battles and speeches is intolerable" to him. His criticism of the old masters is precisely that which is made by technically well trained critics of to-day—namely, that they had none of that sense of "values" which was first discovered by the Dutch school. His objection to Ruskin, notwithstanding numerous "passages of great eloquence," is aroused by "multitudinous absurdities;" and while finding much in Carlyle to admire, he cannot rate Carlyle as a philosopher, because, "instead of thinking calmly, as the philosopher above all others does, he thought in a passion."

Perhaps the very best example that the Autobiography affords—in fact, the best that Mr. Spencer's writings anywhere afford—of this habit of his mind of going instantly to the core of things, and arriving at a judgment of essentials which thenceforth could not be shaken by any accumulation of incidentals, is found in the story of his uncompromising rejection of Kant's "Critique of Pure Reason" as philosophical humbug. He condemned this famous work because he found it to be pre-eminently an expression of

"that belief in the unqualified supremacy of reason" which "is the superstition of philosophers. Without showing any warrant, or making any attempt to show a warrant (there being, in fact, no warrant to be shown), they assume that in each step throughout an argument the dependence of conclusion upon premises, which in the last resort is an intuition, has a validity greater than that of any other kind of intuition: the truth being, contrariwise, that it has a smaller validity. A simple intuition, such as that by which we apprehend Space as external, has a clearness and strength transcending that of a series of such internal intuitions, constituting an argument."

It is not easy to summarize in a few words the net impression of Mr. Spencer's mind and character which one obtains from these judgments of men and things, these analyses of himself, and this record of the incidents and struggles of his life. The second volume is taken up with the story of the genesis and writing of the "Synthetic Philosophy," and with comments upon the men and things that interested him in the latter half of his life. It deepens the impression already made by what was known of his career before and immediately after his death, that his unfaltering devotion to this work was one of the superbly heroic achievements that have marked the evolution of human thought no less than the creation of political states. Throughout it all, and throughout the incidents of his earlier life, and revealed in his attitude toward men and events as set forth in this Autobiography, Mr. Spencer appears as a man whose emotional nature, to which he attaches so much importance, was quite as unusual as his intellect. And yet it is not an emotional nature of charm and attractive quality, so characteristic of Huxley, or even, in a more serene sort, of Darwin. It is the emotional nature of a man whose ruling passion is justice rather than generosity. The reader finds himself almost wishing at times that this remarkable nature were not so finely balanced. One misses the spontaneous exuberance that goes with self-forgetfulness. There is no suggestion of that resistless impulse now and then to do and say unexpected things that made Huxley so lovably human. One finds one's self asking, time after time, whether Mr. Spencer, quite as regardless of social conventionality as George Henry Lewes was, could have loved a woman passionately enough to have set reputation and worldly success at naught and run away with her as Lewes ran away with Marian Evans, and one is obliged to answer that the thought is quite incredible. Uncompromising truthfulness, absolute candor, a dispassionate love for justice and that calm "forecasting" of utilities and probabilities that, as he himself tells us, were characteristic of his ancestors, these were Mr. Spencer's virtues and—his limitations!

New York City.

Literature

Female Confessions

Two anonymous books have just appeared in the literary world like twin adventuresses with masks over their faces. One * is written by a young woman who confesses other people's sins against herself, and the other † by a married woman who goes a step further and confesses her own sins. Marguerite is beautiful, educated and cherishes the ambition to be an artist. This is why she refuses one lover in the first chapter, four in the second, and establishes herself in a garret in Chicago with her wings and canvas stretched to meet fame. Suffering, hardship, hunger follow, but not fame. Also the men give her unnecessary trouble. The amazing thing is that, being so chilling in her manner, she should be annoyed by so much dubious attention. And the reader is obliged to infer that she often misinterprets the glittering generality of masculine admiration for something more intimate. Thus, when an old man comes in and offers her a sandwich, she shows him the door, not because her pride is offended but because she suspects him of the most sinister designs upon her morals.

But, unlike most books of this kind, it is not written to exploit the author's rabid defense of her virtue, but to explain how she lost it through no fault of her own, for she clings to it with frigid tenacity to the end; but, having confessed that her pictures are bad, she is inconsistent enough to cherish a grievance against the world for not encouraging her. She is especially bitter against Chicago,

"A city that receives its opinions by mail can never become an art center. An Angelus might be painted in Chicago and yet bear the mark of Cain. Singers, arising in the country, go to Chicago to lose their voices. Music-loving Germans go there to learn to despise the grand opera. Country districts that hate art send representatives to that town; indeed, it is made up of country places, composed of men and women whose physical energies have been narrowly confined. They are the hard visaged apostles of the material, and here they find an atmosphere that is best suited to them. To such people success is the Man Child and energy is the Virgin."

This paragraph indicates the bitterness of her mind, and it is a fair example of her acid literary style. And even she has not escaped the contaminating influences of her surroundings. Being hungry one day she refers indignantly to the "Noon whistles blowing for the artisan." "Who blows the noon whistle for struggling art?" This is pathetic, of course, but it is what she calls Chicago pathos. There is nothing to show that she deserved a call to dinner. When the struggling artist does something of equal worth to the world she will share the brick mason's privileges. It is not so bad to starve—it is often respectable and sometimes illustrious to do so. The trouble with Marguerite is that she lacks the genius of her calling, and her success will consist in having written a book in which she tells the worst about everything.

In the other book, *I*, the author declares "a woman tells the truth about herself," and she challenges those who are without sin to cast the first stone. This is an old trick, to grime innocence with a dark hint of kinship. As a matter of fact, the best women are not so intimately acquainted with themselves as is this woman whose blood-heated imagination traces every motive and emotion to an erotic source. She disgraces the eloquence and innocence of beauty by confessing a smile and then agonizing over the depravity of having thus beguiled the eyes of a man. The criminality consists in the sinister interpretation she places upon her action. A good woman may live charmingly without repenting of any man's admiration, because she accepts it as a part of human nature's order and not as a proof of her own alluring depravity.

It is a bad sign anyhow when women begin to confess. It is morally debilitating to the race, even when it is done in fiction, because it tends to destroy the

* CONFESSIONS OF MARGUERITE. New York: Rand, McNally & Co. $1.50.

† I. New York: D. Appleton & Co. $1.50.

ideal of the sanctity of womanhood. Besides women do not know how to confess. Sin makes them insincere, dramatic. They take themselves too much to heart, they pity themselves and sob back comments to the reader or priest while they gaze at their tear-stained faces in the mirror of their imagination. And once they get the confessing mania they surpass the meanest reprobate in defaming themselves.

Some Music Books

Among the most welcome of all the volumes thus far announced in that important series called "The Musicians' Library" are the two recently issued containing selections respectively from the piano transcriptions of Liszt* and the songs of Brahms, the latter of which, indeed, is the first gathering of its kind of the Brahms *Lieder* that has ever been made. In these books the high standard of excellence set by the first issues of the series has been ably maintained. For the benefit of the music lover as yet unacquainted with this "Musicians' Library" it should be noted that while the plan of the series is to include all the masterpieces of song and piano music, it is not to be confounded with the old-fashioned authologies of "choice selectons" in bulky sets of fragmentary volumes. In short, its scope is unique in that it seeks to gather into well-made volumes of uniform style the best work of the best composers, edited by living men of authority—each volume to be independent, complete in itself, and sold by itself.

In the book of Liszt Transcriptions Mr. Spanuth has brought together a finely representative selection of the great Abbé's works in this class. There are "The Nightingale," founded on a melody by Alabieff; paraphrases of two Polish songs by Chopin; two free improvisations on waltz themes by Schubert (of the nine gathered under Liszt's title "*Soirées de Vienne*"); three transcriptions of Schubert's songs; piano arrangements of songs by Franz, Schumann and Mendelssohn; two of the improvisations known as the "*Soirées Musicales de Rossini;*" one of Paganini's *Grandes Etudes,* and the opera fantasias, *Berceuse,* from Gounod's "Queen of Sheba;" paraphrase on the celebrated quartet from Verdi's "Rigoletto," and three Wagner transcriptions: spinning song from "The Flying Dutchman," Evening Star from "Tannhäuser," and Elsa's Bridal Procession from "Lohengrin." This music is prefaced by a short, succinct, readable summary of Liszt's life and work, in which the editor holds (and we heartily agree with him) that the musical world knows too little of Liszt's compositions; that "the time has come to let the light of Liszt's works dissipate the haze of a more or less mysterious admiration surrounding his name." That Mr. Spanuth's attitude toward his composer is the sane and wise one is shown conclusively when he says: "There are still many musicians and writers on musical topics too fond of posing as detractors of Liszt; but, on the other hand, there are also too many enthusiasts who, blindfolded and drunk with admiration, undertake to overpraise everything Liszt has done and written; and to passionately dispute every argument brought forward by his most benevolent critics. It would certainly be better to leave arrogant and unjust attacks unanswered, and instead work for the propagation of Listz's works and ideas." It is just such a labor of love that has been accomplished in this volume, carefully, conscientiously and successfully. It will delight many a devotee of music who already knows something of Liszt's wonderful piano transcriptions, and should bring new delights to many another whose knowledge is not so extensive; and so is an example of the best kind of agency for the propagation of the lofty and beautiful music of one of the noblest spirits that ever blessed the world.

From the 196 songs for solo voice written by Johannes Brahms Mr. Huneker has culled his forty with wisdom and skill, and the result is a delightful selection. It is, moreover, what he claims for it: "A just representation of the Brahms song literature," and ranges from "The Little Sandman," No. 4 of the *Volks-kinderlieder,* which was written for the children of Robert and Clara

*Twenty Piano Transcriptions by Franz Liszt. *Edited by August Spanuth.* (The Musicians' Library.) Boston: Oliver Ditson Company. $1.50.

Forty Songs by Johannes Brahms. *Edited by James Huneker.* (The Musicians' Library.) Boston: Oliver Ditson Company. $1.50.

Schumann, to "In Summer Fields" (*Feldeinsamheit*, Op. 86, No. 2), "Love Song" (*Minnelied*, Op. 71, No. 5), and "A Thought Like Music (*Wie Melodien*, Op. 105, No. 1). The singer to whom the songs of Brahms are unknown could find no better way to become acquainted with them than through this collection. In his introductory comment Mr. Huneker, who is the most brilliantly clever of all our writers on musical topics—tho not always the most judicious—succeeds fairly well in curbing his tendency to hyperbole, paradox and extravagant statement. If it is not quite true that "there is little dispute over Brahms's right to rank with Schubert, Schumann and Franz as a great master of lyric art," it should be true, and no doubt will come to be true one of these days. We hold no quarrel with this editor because Brahms is one of his musical gods. Certainly the songs he has gathered from that Titan's store do "all contain beautiful music," and besides, they are different from other songs—distinctive, individual and characteristic of their creator. They are not easy songs to sing, many of them, as Mr. Huneker says, making exacting demands upon the singer's intelligence, musicianship and emotional powers—but alike to those who can sing them and to those who hear them sung aright they bring genuine pleasure of the highest kind.

Both books, printed by D. B. Updike at the Merrymount Press, have been handsomely made. Probably no clearer or more beautiful music page was ever printed in America.

In *The Corona Song Book** Mr. William C. Hoff has gathered and arranged for school use 141 part songs, choruses, oratorio selections, hymns and patriotic songs, and the collection appears to be eminently well suited for the purpose in view. The selections are arranged in two, three and four parts, making them available for various school grades. Many of the best lyrical composers are represented by pieces of melodic and harmonic excellence. The book is modern in arrangement and material; and we are told that in making the selections both of music and words the compiler had the help and the friendly criticism of "many of the leading composers and musicians of the country." The collection, as a whole, makes a notable advance over the old-fashioned song books in use in American schools a few years ago, and compares favorably with the best of those in use to-day. The one or two innovations noted (such as the humming, instead of playing, of certain accompaniments), without being in any way startling, are interesting and have probably been tried with success in the schools where the author's labors have lain. The book is attractively made.

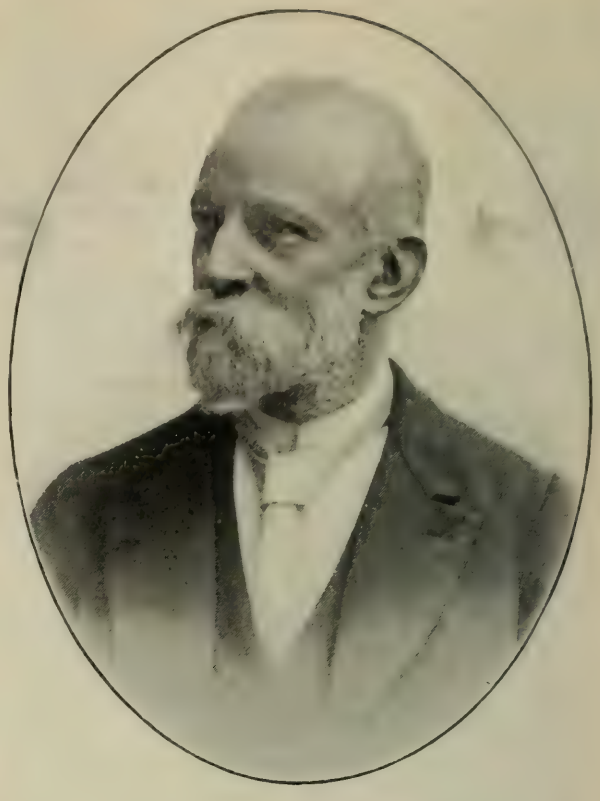
The compilers of the *New First Music Reader** have made, on the whole, an attractive collection of melodies for sight singing by the youngest public school pupils. The statement is made in the preface that the plan of the little book is "the result of careful study of the child's intellectual and emotional nature, child melody and poetry and the child's school environments," and that the melodic settings faithfully interpret the spirit of the poetry which illustrates the different moods of child life. This may be true for the most part, but where, for its accomplishment, the authors have thought it necessary to provide new musical settings for the words of certain fine, old songs the result is not happy. The one glaring fault of the book, in short, is that like so many music books of the day, religious and other, it contains examples of this kind of vandalism. Rather than spoil an old, favorite song by meddling with its melody, leave it out of your book. Of kindred fatuity is the way the poetry has been knocked out of Brahms's beautifully simple little song, "The Little Sandman" by calling it "The Little Dustman."

* THE CORONA SONG BOOK. *A Choice Collection of Choruses Designed for the Use of High Schools, Grammar Schools, etc. Selected, Compiled and Arranged by William C. Hoff, Director of Music in the Public Schools of Yonkers, N. Y.* Boston: Ginn & Company. $1.00.

* NEW FIRST MUSIC READER. *By James M. McLaughlin, George A. Veazie and W. W. Gilchrist.* Boston: Ginn & Company.

How George Rogers Clark Won the Northwest †

THE exploit of George Rogers Clark in seizing the strongholds of the Northwest and thus opening the Western door to the American Republic has never been



† HOW GEORGE ROGERS CLARK WON THE NORTHWEST, AND OTHER ESSAYS IN WESTERN HISTORY. *By Reuben Gold Thwaites.* Chicago: A. C. McClurg & Co 1903.

told in so scholarly a fashion, or with such vivid detail as in Mr. Thwaites's new book of essays. It is a wonderful picture—the vast hunting ground north of the Ohio; the inrush of Kentucky settlers, kept south of the Ohio by the British control of the French hamlets and the frontier forts; the project of the heroic Kentuckian, Clark, to seize these centers of British influence; his raising volunteers from among the backwoodsmen; the movement of his flotilla down the Ohio, and the rapid march to Kalkaskia; its seizure, and the advance toward Vincennes, crossing the "drowned lands," fatigued and hungered, wallowing on through the swamps, led by "the man of iron"; the threat to the villagers, and the attack on the terrorized fort, followed by the unconditional surrender—all this dramatic movement is made to line with a wealth of detail, accurate, trustworthy and suggestive. The importance of the conquest, because of its effect upon the treaty of peace, is hard to overestimate.

Following the leading essay is a skilful treatment of the rather arid subject of "The Division of the Northwest into States." This dry stratum is followed by a story of "The Blackhawk War," which any boy would read with avidity, tho the scholarly sense of proportion and values is never lost. If we find the stockade forts, the Indian scouts, the "hot trail," and pursuit and battle, we find also the significance of it all for our Western history. Next we have "The Story of Mackinac," filled with the romantic lives of Nicolet, Joliet and Marquette. "The Story of La Pointe," "A Day on Braddock's Road," "Early Lead Mining on the Upper Mississippi," and an essay on the "Draper Manuscripts" complete the volume. The last is a brief sketch and a tribute to L. C. Draper, who made that rich collection of sources for Western history now in the library of the Wisconsin Historical Society.

A Critical Study of the Various Dates Assigned to the Birth of Christopher Columbus. By Henry Vignaud. London: Henry Stevens.

Mr. Henry Vignaud, the scholarly First Secretary of the United States Embassy in Paris, has just issued a neatly

HENRY VIGNAUD
Author of "A Critical Study of the Various Dates Assigned to the Birth of Christopher Columbus"

printed monograph devoted to the much discussed question of the real date of the birth of the discoverer of America. In the picturesque little village of Bagneux, within sight of the walls of the French capital, Mr. Vignaud resides in a commodious house, where he works in the midst of one of the largest and best equipped libraries of Americana that exists outside of the United States. When he quits the Embassy, late in the afternoon, the hard-worked diplomat becomes the equally hard-worked man of letters, ensconces himself in his cozy study at one end of the long library building, where he remains, except for a short break for the evening meal, till far into the night. In this way Mr. Vignaud has found the time to produce his "Toscanelli and Columbus" and other books relating to geography and discovery. He is now giving the final touches to a very important volume devoted to the life of Columbus before the period of the voyages of discovery. The present little volume will eventually form a chapter in this larger work. After presenting all the known facts concerning this birth date, and after carefully weighing the pros and cons, Mr. Vignaud concludes

as follows: "If logic has not lost all its rights, the fact that Columbus was born in 1451 is as solidly established as many other events which have become historical, and which no one has been bold enough to question."

Sandro Botticelli. By Julia Cortwright (Mrs. Ady). New York: E. P. Dutton & Co., 75 cents net.

Julia Cortright is steeped in the history of the Italian Renaissance. She has written, among other things, an admirable monograph on Raphael and charmings histories of the d'Este sisters; so that we felt justified in expecting an excellent life of Botticelli from her pen. It is true that her pleasant, discursive style is better adapted to a lengthy history than to the little Popular Library of Art series. But she has certainly shown great lack of discrimination in using the few pages at her disposal in recounting anecdotes of the artist's family and giving rambling descriptions of pictures, when an analysis of the essential characteristics of Botticelli's style and serious critcism of his works are infinitely more important. The truth seems to be that Mrs. Ady has relied on her general knowledge of art and made little preparation for this life of Botticelli. The book is pleasant reading and contains some desirable information, but the workmanship is careless and the language often loose. It is a pity, for Botticelli is one of the most subtle of artists. His strange, morbid women halt between harmonious paganism and penitent Christianity, and yet they have a poetic charm of their own which few can understand, while the unrivaled beauty of his line composition is almost hidden from the uninstructed. It is concerning these things that many desire to be enlightened.

Extracts from Adam's Diary. By Mark Twain. New York: Harper and Brothers, $1.00.

Formerly Mark Twain used to write very large books; now he writes very small ones, but they are just as funny. He has always considered it his duty to champion the claims of Adam to a place in the Hall of Fame, and was the first to propose a monument to Adam, for to him, as he truly says, the human race owes much. This book deals with the first honeymoon in the world's history, which, very appropriately, was spent at Niagara Falls. This site is different from that formerly given by the historians, but it could be proved by the testimony of many couples that Paradise is really located at Niagara Falls. On careful examination we note many important particulars in which the literary style of this work differs from Mr. Milton's treatment of the same subject. Adam's scientific ability as the first taxonomist has never been so well brought out before as in the following passage, from his observation on Cain, after the family had moved to Tonawanda:

"It is built much as we are, but its method of traveling shows that it is not of our breed. The short front legs and long hind ones indicate that it is of the kangaroo family, but it is a marked variation of the species, since the true kangaroo hops, whereas this one never does. Still, it is a curious and interesting variety, and has not been cataloged before. As I discovered it, I have felt justified in securing the credit of the discovery by attaching my name to it, and hence have called it *Kangaroorum Adamiensis*. Three Months Later. . . . It must have been a young one when it came, for it has grown exceedingly since. It must be five times as big, now, as it was then, and when discontented is able to make from twenty-two to thirty-eight times the noise it made at first. Coercion does not modify this, but has the contrary effect. For this reason I discontinued the system. She reconciles it by persuasion, and by giving it things which she had told it previously she wouldn't give it."

Borlase and Son. By T. Baron Russell. New York: John Lane, $1.50.

"Mr. Borlase, indeed, never considered religion or the Bible as exercising any relation to his own conduct; he had too high an opinion of their Author to suspect them of any ill-mannered personalities. Cursed then be he, by all means, who removed his neighbor's landmark. . . . There was nothing whatever said about undermeasuring your neighbor's calico, and Mr. Borlase's withers were unwrung." This passage, dropped casually, as it were, somewhere near the middle of the book, might well have been put at the first as a text, or at the end as a summing up, of the character of the man who shares with his son the honor of providing a title. Honored vestryman and successful proprietor of a London sweatshop, such are

his paradoxical distinctions, and this passage furnishes the key to the disposition which was capable of virtuous complacency in both. That the book is above the average, both in style and delineation of character, perhaps needs no better proof than that, tho practically guiltless of love scenes, it compels an attentive interest on every page. It is pre-eminently a man's story, for there is only one important woman character in the book, but each man has an individuality and contributes his share, attractive or repulsive, to the picture of two different strata of the London mercantile world. Not the least clever work in the book is the description of "bargain day" and the Christmas attractions in Borlase & Co.'s "Emporium." In his preface the author disclaims any intention of "the inculcation of social, still less of business, morality," but his choice of theme and manner of treating it point to a deeper motive than that of pleasing or interesting alone.

From Sunday to Sunday. By H. C. G. Maule D.D., Bishop of Durham. New York: A. C. Armstrong & Co.

The purpose of the book is indicated in the preface: "The chapters are intended for reading on the Lord's Day, thus helping to bring together these two great blessings of Heaven, the Sunday and the Bible. . . . If this book, such as it is, helps its readers ever so little to prize both more, thankful shall I be," etc. There are fifty-two brief chapters written in a pleasant style, written in a devout spirit, sane, free from mawkishness and well adapted to quicken devotion and provoke meditation.

Plays Acting and Music. By Arthur Symons. New York: E. P. Dutton & Co., $2.00 net.

This is a collection of the studies of plays and players originally contributed to the *Academy* and other periodicals, but criticism by Mr. Symons has a permanent value which makes it worth rescuing from the drifts of the papers of yester-year. His observations range from Yvette Guilbert to Wagner, from Nietzsche to Pinero, and will be of interest to the many to whom the actors he knows so well are merely names. The book is artistically printed, which means that it is hard to find topic headings or page numbers.

Pebbles

SHE reclined in a large arm-chair, while he leaned over her with a smile upon his face. Her locks brushed against his forehead, and both waited to speak. Finally he broke the monotony by exclaiming: "Three of your back teeth need filling, and one of them will have to come out."—*Wrinkle.*

THE PREVAILING TOPIC.

I passed two women on the street;
Said one: "The way 'twas made was sweet."

A moment later came in view
Two others. One said, "Trimmed with blue."

I jumped upon a car, and heard
A woman say: "Yes, tucked and shirred."

As I got off two girls got on;
I heard: "With lace and white chiffon."

I reached the pavement, heard a maid
Say to another: "What's the shade?"

Went in a rest'rant. Waitress said:
"Draped over black, caught up with red."

The fair cashier who took my check
Was saying: "How'd you trim the neck?"

Went home. My wife awaited me.
"Where are those samples, dear?" said she.

—*Brooklyn Life.*

NEWSPAPER ROMANCES.

If Death did not come to you when you desired, would you adopt any of the methods you read of in the papers?

At Albertville, Mo., yesterday, John Hale, angered because his wife saved the best preserves for the preacher, went into the parlor and cut his throat. But he remembered she was a neat housekeeper; also that a new carpet would be an extravagance; so he carried a bucket in with him, and tied his head in such a way that not a drop of blood was spilled. The good man made no muss whatever in passing on.

Angered because he saw another man's arm around his girl, Peter Hulinkey, of Essex, Wash., cut off his own arm, pinned a card to it, saying: "This will never go around you again," put it in a box addressed to the Fickle One, and then lay down and bled to death beside it.

His neighbor refused to let Garry Leaper, of Rushville, Ind., use his well, so Leaper got even by spoiling the well water; he jumped in, and his body was in the well six weeks before found.

All are pitiful and tragic, except in those cases where poison was taken and the stomach pump made the victim a fountain.

—*Atchison Globe.*

Editorials

A Democratic Platform

Democrats throughout the land, and many Republicans, were deeply interested in the recent Democratic convention at Albany. It was to be the beginning of an active campaign for the nomination of Judge Parker. Democrats in other States who were inclined to support him waited for those instructions at Albany which were to show that he had the support of his own great State. They also waited for the convention's platform, knowing that it would have his approval, and expecting that in it his attitude toward the political issues of the time would be disclosed. With propriety, he had remained silent. Here was an opportunity for his friends to make his views known. Because his friends controlled the convention, were in consultation with him, and realized the political importance of what they were doing, the platform may fairly be regarded as one approved, if not prepared, by Judge Parker himself.

Professing to be a "declaration upon the national issues of the hour," it is vague, ambiguous, and evasive, almost without meaning in some of its expressions, almost puerile in others. Some may say that, owing to the condition of the party, it was expedient to make a conservative utterance, in order that factional opposition might not be excited. But true conservatism is not without point or meaning. And this platform has not failed to accentuate factional differences. It is attacked and ridiculed by the radical element of the party; it is disappointing to many conservatives who desired to find in it ample warrant for their support of Judge Parker. We do not see how it can satisfy, or draw to him, those intelligent independent voters whose aid the party will sorely need.

A considerable part of this platform is an assertion of general principles which all honest and intelligent Democrats or Republicans accept. We all believe that "extravagance" should be checked, that there should be "honesty in the public service," that "fraud should be prevented," that the "guilty" should be punished. No one will say that there should be one law for the people and another for Presidents and Cabinets, that "usurpation" is to be defended, that the executive should encroach upon the legislative or judicial departments, or that treaty pledges should not be "kept inviolate." The brief reference to that "love of liberty and of peace which the spirit of military domination tends inevitably to weaken and destroy," the assertion that "a restless spirit of adventure engenders alarms that check our commercial growth," the expression of a desire for "peace, to the end that business confidence may be restored"—to these all good citizens are ready to subscribe. Even Mr. Roosevelt, at whom probably they were aimed, would heartily defend these doctrines. As set forth in this platform they are indefinite, impersonal, and politically ineffective. "The rights of labor and of capital must be impartially maintained." That may be a safe saying, but it leaves something to be desired. "No unequal discrimination." This curious phrase calls for definition.

There is left the following utterance concerning a group of questions of great and present importance:

> "4. Corporations chartered by the State must be subject to just regulation by the State in the interest of the people; taxation for public purposes only; no Government partnership with protected monopolies.
>
> "5. Opposition to trusts and combinations that oppress the people and stifle healthy industrial competition.
>
> "7. Reasonable revision of the tariff; needless duties upon imported raw materials weigh heavily upon the manufacturer, are a menace to the American wage earner, and by increasing the cost of production shut out our products from foreign markets.
>
> "8. The maintenance of State rights and home rule; no centralization."

These paragraphs, taken together, may fairly be interpreted as meaning that corporations should be regulated by the State, and not by the Nation. "State rights and no centralization." But interstate railroads chartered by a State must be subject to regulation by Federal authority, if they are to

be regulated at all. The Democratic party complains that Federal authority has not been sufficiently exercised under the Anti-Trust law for the regulation or the suppression of Trust corporations which have State charters. Only by Federal authority can the transportation and manufacturing corporations that are national in scope be subjected to just supervision and restraint. For the accomplishment of this purpose centralization is necessary, and a rigid maintenance of State rights is a hindrance. Does the platform, and does Judge Parker, insist upon the doctrine that Federal authority should not be exercised with respect to State-chartered corporations? It is a reasonable inference, and this is the construction given to the platform by prominent Democrats in Congress who have been by no means hostile to Judge Parker's nomination. If this is the platform's meaning, the promulgation of such a "declaration upon the issues of the hour" was an extraordinary blunder. As for the tariff, "needless" duties are not, of course, to be defended by any party; but what the Democratic masses want is not the removal of duties on raw materials, unless it is accompanied by a large reduction of the duties on manufactured goods.

There is nothing to be gained for the party by such a platform as this. Some have said—and they are Senators of the United States—that it is an excellent model for the platform to be made and adopted in the national convention. But the blunder will not be repeated there. If the construction of the national Democratic platform is intrusted to men of wisdom and shrewdness, it will not be vague, obscure or indefinite, nor will it oppose the settled policy of the party as to a prominent, and perhaps the greatest, issue of the hour.

If the platform makers at St. Louis are wise they will say that the Sherman act should be so amended that it will not be applicable to railroads; that the disintegration of all existing combinations of parallel and naturally competing railroads is not to be desired; that power to regulate and to determine rates should be given to a thoroughly competent Interstate Commerce Commission; that an attempt to restrain and supervise great Trust corporations of manufacturers should be made by applying that interstate transportation penalty which Attorney-General Knox suggested, which the House adopted, and which the Senate ignored; that, if power to restrain and supervise cannot be applied in that way, manufacturing corporations of national scope should be brought under Federal control by Constitutional amendment. There should be no indiscriminate denunciation of corporations, whether these be combinations or not. That would be an indication of deficient education or arrested mental development. Devise laws for the just government of corporations, enact them, and enforce them. These must be laws fitted to present conditions, not to those of half a century ago.

A national platform, whether Democratic or Republican, should demand a reduction of tariff duties that enable combined manufacturers to extort high prices from the American people, while they sell their goods at much lower prices abroad. For example, steel rails at $28 here and at $21 in Canada and $19 in Arabia. Where that competition in the home market which protection was designed to cause and stimulate has been suppressed, the protection should be cut down. There is enough tariff issue in this. Our agriculturists will not vote for free trade in raw materials. The Democrats should stand also for real reciprocity, not reciprocity in non-competitive products alone, but for such reciprocity as McKinley approved, in the treaties made by his Commissioner, which a Republican Senate smothered. In the same group of issues opposition to ship subsidies might well be included.

If the Democrats believe that Mr. Roosevelt has been guilty of usurpation, that his spirit is that of "restless adventure and military domination," they should say so distinctly and try to prove it. But it would be the greatest folly to assert that he is insincere or dishonest. The people would never believe it. Panama the Democrats should approach with hesitation and much diplomacy. There may be room for argument as to some of the details of that affair, but half the Democratic Senators voted for the treaty, and a large majority of the American people thoroughly approve the President's action. The establishment and maintenance of the gold standard should

be accepted as an accomplished fact. Indeed, it seems to us that a wise Democratic platform committee should either let the subject entirely alone or definitely support the gold standard. Silver, as John Sharp Williams said in the House, is as dead as secession.

What has been called imperialism is not and cannot be a "paramount" issue. With respect to the question whether the United States should acquire additional detached territory and govern it by colonial methods there is room for a wide difference of intelligent and honest opinion. The Democrats might reasonably express their views on this subject at St. Louis. As to the Philippines, however, so far as acquisition is concerned, the case is closed. There remain to be determined the policy of government and the ultimate political condition of the Filipinos. The purpose of the Republican party, as indicated by the President, Secretary Root and Governor Taft, is not so much at variance with the policy recently preferred by the Democratic party that the disagreement can have weight in a national election. There is more politics to-day in the tariff on Philippine products and the proposed application of the navigation laws to trade with the islands than in a dispute as to the time when the islanders shall be fit and shall be empowered to govern themselves.

We have briefly considered the manner in which the Democrats might so express their views that their platform would appeal to, or at least would not offend, those intelligent voters who stand on the skirmish line between the two parties and would be glad to see an Opposition that they could respect and support. But a really good Democratic platform would differ as widely from the vague utterance made at Albany as it would from any statement of issues and principles that Mr. Bryan and his followers could be induced to commend.

New Aspects of the Labor Movement

"Under all disguises, and in all its forms, the labor movement is a struggle for control." This characterization from an essay on "Industrial Democracy," published some years ago, is borne out by recent events. It is not enough that the leaders of organized labor succeed in obtaining, one by one, the specific objects for which they contend. Wage concessions, recognition of the union, the closed shop; these are but approximate gains. The wage earning population must control the industrial situation. This is the real platform of the labor movement.

Two events of the past week have revealed the extent and force of the determination to control. Socialists have contended—with that simple faith in the efficacy of social machinery which is the most curious feature of their creed—that public ownership and control of industry would put an end to industrial war. Yet within less than two years we have witnessed three widespread revolts by the employees of State controlled railways, one in Holland, one in Italy and now a third in Hungary; while from the other side of the world, in Australia, comes a report of a parliamentary defeat of Premier Deakin on a motion to enforce arbitration of disputes with the employees of the commonwealth. These occurrences reveal clearly the attitude of "labor" toward any and all forms of industrial organization. If "labor" professes to desire a substitution of the Socialistic state for the existing order of things it is in the assumption that "labor" is the state, and can dictate terms to its agent, the Government, and to its subjects, all rebellious individualists, who would like to be scabs or capitalists.

What the outcome is to be is a question that can be answered only by ascertaining how far this assumption that "labor" is the state is true, or is becoming true. Sovereignty is a fact, not a theory. Somewhere in every commonwealth there exists a power to compel obedience, to which all rebellious individuals or combinations of individuals must submit. The sovereign may be a personal despot, backed by an army; or it may be a mob, that with ruthless violence sweeps all resistance before it, as the proletarian commune of Paris did in the Reign of Terror. It may be a combination of capitalistic corporations, controlling legislatures and courts; or it may conceivably be that new and growing power called organized labor. Theoretically ultimate

sovereignty in America, England, Australia, France and Switzerland resides in the people, the whole people, and not in any class. If this theory is at variance with fact, and if "labor" is becoming the real sovereign, which everybody must obey, it will be possible for such movements as the Hungarian strike and the Australian attempt to establish arbitration between the Government and its employees to succeed; but if sovereignty is still an attribute of the people in its entirety, these schemes are preposterous and must fail.

Assuming that for a while longer, at least, the people will remain sovereign, the proper procedure in dealing with strikes by Government employees is not difficult to determine. The conduct of the strikers is of an absolutely different character from that of strikers against a private employer. It is mutiny, differing in no essential respect from that gravest of all military offenses, revolt, or refusal to obey orders. It must be dealt with as that offense is dealt with. Happily this position has been taken thus far by every Government that has had the issue to meet. Holland gave its railroad service to understand that obedience would be enforced, by muskets, if necessary. Italy gives to its railroad service the status of an army reserve; and when the strike began, a year ago, the Government promptly put the whole force under military discipline. The Hungarian Government is prepared to put soldiers into the places of strikers to any extent that may be necessary.

These facts and considerations should be an all-sufficient rejoinder to the argument of those persons who see insuperable difficulties in the public ownership and control of public utilities. There is only one real question involved—the question, namely, whether the people, the whole people, is sovereign. If any class is sovereign in a modern state, the sovereignty of such a class is bound to assert itself, whatever the form of the social organization may be. If "labor" is sovereign in Australia, in Hungary, or in the United States, it will have its own way, whether through the machinery of government or the machinery of voluntary organization to resist government. But if the people as a whole is still sovereign, it can still command all the resources of the state to enforce its will, and there need be no greater difficulty in compelling Governmental employees to perform their sworn duty without deranging business or crippling any public service than in compelling the employees of private corporations to keep all manifestations of dissatisfaction within the forms of law.

Canon Henson's Warning

Canon Henson is speaking so loudly to the English Churchmen that they must perforce hear, and the reach of his voice crosses the Atlantic. In *The Contemporary Review* and elsewhere he tells Christian believers of various names that they must orient their creeds to harmonize with the conclusions of science and criticism. But that we have heard for half a century. He goes on to say that our old notions of the Bible must be so far changed that questions of inspiration and canonicity shall cease to have any importance, and that even now they do not affect an intelligent man's conclusions as to statements in the sacred Books, which must all, under present conditions, be weighed in the scales of evidence just as if no special claims of authority had ever been made for them. Even this, in general terms, might not seem so novel; but it is the illustrations he gives that have startled the Church of England and made men cry out that he is a traitor to the Apostles' Creed which he repeats every Sabbath.

Canon Henson's statements are in good part true. It is true that within the last generation, while these studies of criticism have been going on and their conclusions have become public property, a large part of the teachers in our evangelical churches, so called, even the Professors in our theological seminaries, the instructors of our coming clergy, have ceased to believe that there ever was a Garden of Eden, that Eve was made from Adam's rib, that Methuselah lived 969 years or Moses 120, that Noah built the Ark, that God told Abraham to offer Isaac, that God wrote two tables of the law with his finger on Sinai, that the walls of Jericho fell at the trumpets' blast, that Elijah ascended in a chariot of fire, that a bear ate the children cursed

by Elisha, that a great fish swallowed Jonah, or that the Pentateuch was written by Moses. They have given up nearly or quite all the miracles of the Old Testament. They interpret the stories away, as legends, or old literature, doubtless far superior morally and religiously to the polytheistic myths of the people about, but yet not historical.

We have got so far along that all this gives us little concern. We are able to find what is as good as inspiration, if not inspiration itself, in the process which converted the crude, coarse polytheism of the nations about into the pure, noble stories of creation and Eden and the Flood and Abraham; which, out of Judea, gave us one God whom our highest development need not blush to worship. But it is another thing when Canon Henson tells us that the same criticism is being applied to the New Testament, and a similar conclusion is sure to be reached. He tells us substantially that the New Testament miracles must also go. We might not mind it so much if he had said that some must go, as the cures wrought by Peter's handkerchief, or his shadow; but when we are told we must also give up the miracles of healing wrought by our Lord, and the darkness from the sixth to the ninth hour when the spirits of the dead walked the streets of Jerusalem, and the rending of the veil of the temple, and even the whole story of the virgin-birth of our Lord and all the pretty tales of his childhood, we are bound to pause a little. And as to his resurrection, that is explained away, not exactly as a myth, but as a vision of excited minds, a reality to the disciples and the women, at least to some of them, but no more a real resurrection of the body than is our own "resurrection of the body," "*carnis*" of the Creed, to be a veritable resurrection of the flesh.

This, somewhat developed, is what Canon Henson, a light in the Church of England, tells us we must fit our theology to, now that we have accepted the conclusions of science and biblical criticism. We have hardly begun to adjust ourselves to the loss of our infallible Old Testament, with its fall of man, before we are told that we must give up equally the New; and this demand comes, in the interest of Christianity and truth, from a high dignitary in the principal Protestant Church of Great Britain.

Must we yield all the miraculous element of the New Testament as well as of the Old? Are we compelled to confess that what is evidently legend in the Old Testament is matched by what is equally, but less patently, legend in the New? Not yet. It is true that a parity of reasoning—and, of course, the same process of investigation must be applied honestly to both Testaments—will compel us to admit that legend may enter into the composition of the New Testament. But it has less scope. It has no dark background of unknown ages about which it can grow. The life of Jesus began in historical times, in the reign of Tiberius Cæsar; and the story of his life and teachings was written, at least in good part, while many of his disciples were yet alive, men of intelligence, who fully believed it, and who died as martyrs, a word which means *witnesses*, to its truth. To be sure there is a growing tendency to believe that legend has grown about the "Gospel of the Infancy," the prefaces to Matthew and Luke, which Mark and Paul seem to know nothing of; and since the discovery at Sinai of a very ancient Syriac translation which tells us that "Joseph begat Jesus," some doubt who never doubted before; but that Jesus did and taught what three Evangelists tell us seems supported by evidence enough, even if the story of the miraculous birth goes far enough back of evidence to allow the play of the pious imagination; or if even—and this is very hard to understand—the miracles of the resurrection and the ascension grew into popular Christian belief while those were alive who were said to have seen them.

All this raises the question, which we are compelled to ask, What will be left of Christianity if everything about Christ in the Apostles' Creed is given up—as it appears to us Canon Henson gives it up—except that he suffered under Pontius Pilate, was crucified, dead and buried? We answer, Nothing but his teaching. The virgin birth goes; the miracles of healing become nothing more than what faith-healers do to-day; Lazarus and Jairus's daughter were not raised from the dead; Jesus was crucified and did not rise on the third day, nor did he ascend into heaven in the sight

of the wondering throng of his diciples, as the record, apparently of eye-witnesses, declares. Indeed, the whole doctrine of the Trinity goes, and we have left nothing more than, if as much as, Dr. Channing and Professor Ware and Professor Noyes taught the Unitarians in the thirties of the last century.

But what would be left, let us ask again. Let us not quite lose heart, even in the concession, not really granted, of all that Canon Henson asks of us. There would be left the teachings of Christ, his development of morals and religion, even altho stripped of supernatural authority. However those teachings came, and however supported, they certainly did come, and they brought a fresh view of duty and of God, such as the world had never seen before, and such as it insists on holding as dear and true. The conception of God as a loving Father cannot be taken away, nor the conception of all men as our brothers, slow as we are to live up to it. The primary obligation to love God and man, to live lives of honest spiritual reality and not of formal, superficial religion, remains and cannot be lost to the world. This is all we can say, and it is much; for it is ideas and ideals that rule the world. To be sure much that seems to us evidence would be lost, something, much, of the proof, if not the assurance, of the future life. The element of fear of the consequences of sin in another life would largely be removed, which would be a most serious loss, but the spiritual sense, the domain of conscience, would not be diminished. We should not at all despair of humanity, altho it would be a revolutionary task for our Christianity to accommodate its theology—not its life—to the new views. The most serious considerations would be in the danger that those who had been held back from utter godlessness and recklessness by their accepted belief in the teachings of the Bible as to the future life, might become utter disbelievers in virtue itself, and say, "Let us eat and drink, for to-morrow we die." The danger would be of the loss of public morality when its spiritual sanctions were lost; for there are many not controlled by ideas and ideals, but by the opinions of those about them and above them; and would it be possible for the higher truth and sense of duty held by the better men, the real moral leaders, to control the mass of people? We have faith enough to believe such would be the case in the future, as it has been in the changes of the past.

Nor do we believe that the value of our Lord's teachings depends so very much on the attestation of his miraculous career. No conclusions of criticism or history or science could overthrow what we have gained from his teachings. For the new lessons of goodness, when once revealed to sight, attest themselves; they cannot perish. There is development in the moral sense, in ethics and religion, as well as in science. What we got from the teachings of Jesus is just as secure as what we got from the teachings of Galileo or Sir Isaac Newton. It has become our accepted acquisition, not dependent on testimony of nineteen centuries ago, but self-evident now, past denial. It has entered into the substance of the human soul. The world adopts it as the present foundation of its moral system, and therefore we believe that it is safe and permanent. For the substance of Christianity is after all the teachings of Christ, not the accounts that have come to us from an uncritical age of his personal life and death.

Fasting as a Religious Exercise

One of the most striking peculiarities of modern Protestantism is its almost complete disuse of fasting, notwithstanding that this has been from the remotest times and in almost all religions one of the most esteemed of the physical modes of spiritual development. It has the emphatic authority of Paul and of Christ, who, in words not to be thrown out by any criticism or weakened by any method of interpretation, correlated it with prayer as means of grace, essential to the cultivation of the highest spiritual gifts. The revered fathers of the Church were practically unanimous in recommending the practice, and even in Protestantism it has been common until quite recent times. Of the holidays of our Puritan ancestors we retain Thanksgiving as an occasion for dutifully overeating, but we have abolished their fast days. We have, however, not yet gone so far as the Zoroastrians, who teach that "he who fasts commits a sin, and must, by way of

expiation, give food to a number of poor people."

The question is of importance whether by neglecting this ancient religious custom Protestantism has, to use the words of Schopenhauer, previously quoted in this discussion, renounced the inmost kernel of Christianity, or whether it is rejected because the experience of the ages has shown it to be unprofitable.

The reasons given for asceticism and voluntary suffering in general are various and sometimes incompatible with each other. According to Nietzsche:

> "Cruelty is one of the most ancient festive joys of mankind. Therefore, the gods also are fancied to be pleased and festively disposed when they are offered the spectacle of cruelty."

This, whether it was ever a motive for self-torture or not, is obviously not now held a reason for it. The same may be said of the old idea that whatever was sacrificed was given to the deity, and of the belief that the gods were envious of human happiness and so must be propitiated lest they should take vengeance on us.

Since we are considering only the *rationale* of fasting, we may also disregard those churches in which it exists by authority and persists by tradition, tho it is necessary to note that in such cases it has a value as a badge or distinguishing custom of the sect, and for arousing curiosity. In the modern Jewish passover service this is clearly shown in the passage where the youngest member of the family is supposed to inquire the meaning of this unusual abstinence, so affording an opportunity to the head of the household to explain its historical significance. Traditional fasting may persist in form long after it has lost its original meaning, as in the Catholic abstinence from meat on Friday. In the greater part of this country fish is more of a rarity than flesh, so, instead of a deprivation, as originally intended, Friday's fish is a luxury.

Abstinence from some particular luxury is often recommended as a special means of saving for some benevolent work, a practice adopted by the Salvation Army. Here, too, traditionalism is apparent, for the two articles of diet most frequently proscribed are butter and sugar, altho these are among the most nutritious of foods for their cost, and an inspection of a table of food analyses shows that one can get more calories for a cent in these forms than in almost any other.

Among the most important reasons advanced for fasting and similar forms of discipline is that of strengthening the will power over the animal instincts by a voluntary and in itself unnecessary self-denial. This power of self-control and repression is, of course, a most important factor in the development of character, and very likely it is one which in these easy and self-indulgent days it may be especially necessary to cultivate. The questions, however, arise whether the ordinary circumstances of life do not afford ample opportunity for the cultivation of this virtue, and whether some other and more intrinsically useful form of abstinence might not be found of even greater disciplinary value than the voluntary denial of appetite.

The defenders of fasting for the benefit of the soul usually lay most stress on the argument that it gives a better opportunity for spiritual development. The soul and body are looked upon as in a sense rivals in a struggle for the possession of the individual, whose entity is considered as a fixed quantity; so what one gains the other must lose. It is necessary to keep the body under to keep the soul on top. The opposite and more modern view is that expressed by Browning in the words: "Nor soul helps body more than body helps soul."

During those centuries of the Christian era when asceticism was dominant the anæmic virtues were thoroughly cultivated and the anæmic vices fully developed. In the sixty or seventy volumes of the "Acta Sanctorum" the Bollandist Fathers have given a very complete record of this invaluable series of experiments in malnutrition, and it cannot be said that the results on the whole are such as to convince the modern mind of the value of the practice. It is questionable whether the visions induced by an empty stomach are of any greater benefit to humanity than the nightmare generated by an overfilled one. A deficiency of red corpuscles undoubtedly makes certain temptations less alluring, but there are some moral diseases which, like physical contagion, more readily attack a weakened system. After forty days of

fasting even Christ was approachable by the devil.

A fasting person may be more aspiring, but he is less benevolent. Abundant domestic experience shows that before dinner a man's temper is not especially angelic, but after dinner he feels most kindly toward his fellow-men. When his hunger is allayed his selfishness is quelled. It is the hour which is taken advantage of by minstrels to approach the table to beg, and by our friends, whose most atrocious jests are received with indulgence and even applause.

Wagner, a master of the psychology of esthetics, took care that his auditors at the temple of music at Baireuth should be fed at the proper intervals, and it would seem that the delicate adjustment of the perceptive faculties which is necessary in the Wagner devotee to enable him to penetrate to the deeper meaning of a complex symbolism of sights and sounds is similar to that needed by those who attend a ritualistic service.

We are here considering fasting in its strictest sense, that of abstinence from the normal amount of food necessary to keep the body in the best physical condition, therefore we need only mention the argument for ecclesiastical fasts based on their purely physiological benefit. The ground for this argument is that we habitually eat too much, and the Church, not able to stop altogether this abuse of appetite, checks it on certain days; just as in an age of constant warfare the Church interposed whenever possible its "Truce of God;" just as now it interrupts the incessant commercial warfare by its weekly "Truce of God." There is no more effective way of enforcing sanitary measures, especially among an ignorant people, than by giving them a supernatural authority. The antiseptic prescriptions of Zoroastrianism were far in advance of the science of its time, and the hygienic and quarantine regulations of the Mosaic law were among the most valuable parts of the Jewish revelation. Overeating is undoubtedly one of the vices of the times, and there are more people now zealously practicing and preaching fasting for their stomach's sake than there are who adopt it for its religious value. There are so many "two-mealers" and "one-mealers" among our acquaintances that we no longer look with so much awe and sympathy as formerly on the priest who does not break his fast until after the mid-day mass.

But ascetic fasting, as distinguished from hygienic fasting, has almost disappeared, and altho the constantly growing influence of High Church principles will, to some extent, revive it, the general tendency of the age is against all forms of asceticism and monasticism. The world needs an aggressive Christianity, entering actively into the thick of the fight, and the sanguineous virtues are more in demand than the pallid ones. It is better to control hot blood than to cool it. Nor can we assume this to be impossible. It was once thought unsafe to use steam at a higher pressure than fifty pounds. Now we have triple-expansion engines and we need and shall have triple-expansion men.

Infection in Tuberculosis

THE center of greatest interest in medicine at the present time is the question of the limitation of tuberculosis. Medical views with regard to the disease have changed very materially in the last few years, and the recent discussion of the subject at the New York Academy of Medicine at the first regular meeting for April reflects the present state of mind of medical authorities in a way that cannot help but be of general interest if for no other reason than because of the at least apparent novelty of what have become accepted opinions in very recent years. For instance, there are very few physicians now who consider that heredity is at all an important factor in the production of the disease, and there are not a few who consider that direct transmission of the disease from parent to child is so rare as to be a medical curiosity. It has been demonstrated that very young children seldom show signs of tuberculosis, practically never until there have been many opportunities for infection.

At the age of about one year tuberculous meningitis is not uncommon, but, as is pointed out, if there is any other member of the family suffering from tuber-

culosis, then the child is especially exposed to the danger of infection. Any carelessness in the matter of expectoration or even the ordinary coughing and conversation of patients is sure to scatter tuberculous material in the atmosphere of the room, whence it sinks to the floor. The child is apt to spend many hours each day on the floor, and besides its own opportunities for the collection of such material on its hands and clothing, is so placed that every movement in the room raises a little cloud of dust, the upward movement of which is only a foot or two, but this is quite enough to make it dangerous for the little one. It even seems not improbable that in families in which there are sufferers from tuberculosis the so-called tendency or predisposition to tuberculosis is in most cases nothing more than a previous infection; that the disease, acquired in very early childhood, which has been unrecognized in the midst of the varying ills of the little one, has been cured, but, as is always the case, has left an encapsulated focus of tuberculous material. Whenever in later life, then, the patient runs down in health the tubercle bacilli, which may remain latent for years in such an encapsulated area, find their way into the system and produce recurring attacks of the disease, which are popularly attributed to the supposed tuberculous tendency in the family. Such exacerbations are especially likely to occur in persons who, in the course of attaining their growth, become emaciated or who during the developmental period are encouraged to work either mentally or physically beyond their strength.

The other important medical opinion that was discussed at the recent meeting of the Academy of Medicine related to Professor Koch's announcement of three years ago that human and bovine tuberculosis are not intercommunicable—that i , that the bacilli which cause tuberculosis in cattle will not cause tuberculosis in man, and that consequently there is no necessity for the elaborate legal mechanism of protection of human beings from the danger of bovine tuberculosis that has been instituted in most countries in modern times. There is now no doubt as the result of observations made in many countries, especially here in America, in England and France, but also in Germany, that Professor Koch was once more wrong in his announcement, and that the only benefit derived from his statement was the impetus to scientific observation which has now absolutely determined the fact that bovine tubercle bacilli may cause tuberculosis in human beings, and that the disease under such circumstances is likely to be more severe than when the infecting agent has come from another human being.

The course of the investigation that has made this fact clear also seems to show that tuberculous infection may take place through the digestive tract much more commonly than has been supposed. Ordinarily it is presumed that infection of the lungs takes place by inhalation of tuberculous material. It would seem an axiom that the reason why the lungs are so frequently affected is that the air breathed in contains infective material. As a matter of fact the mechanism of infection through the air is quite difficult of explanation. Normally the tortuous breathing passages in the nose sift out very thoroughly any material that may be in the air inhaled. After its passage through the nose inspired air must turn at a right angle in order to find its way through the larynx. While it is making this turn it is surrounded by moist mucous membranes ready to catch the smallest particles of dust or absorb globules of moisture that may be contained in the air current. After getting past this corner in its course the air must then pass through the narrow chink of the glottis, where there are two barriers, the false and the true vocal cords, separated only by a small distance from each other, and here once more it encounters moist surfaces, which help in the prevention of the passage of foreign material of any kind.

Even tho tuberculous material should find its way beyond the vocal cords into the trachea, it may still be caught on the mucous membrane there or on the mucous surfaces of the large bronchi, and will then, because of the ciliary movement of the cells of the bronchial mucous membrane, be carried upward and outward, rather than downward and inward. The interchange of air between the large bronchi and the air vesicles in the lungs is carried on not by means of direct currents of air, but by gaseous diffusion. This still further adds to the difficulty of

inhaled particles finding their way to the peripheral portions of the lungs, which are practically the only ones affected by tuberculosis at the beginning of the disease, for it is only exceptionally that bronchitis is of tuberculous nature. When we consider that the initial lesion of tuberculosis is in the great majority of cases at the apex of one of the lungs—that is, just where foreign material of any kind would not be carried by gravity if it did gain entrance beyond the larger bronchi—we can understand the difficulty of the proble mof just how tuberculosis by inhalation can really occur.

This will also make clear why scientific observers have been trying to solve the problem whether tuberculous material may not find its way through the intestines in the ordinary process of absorption of food. Professor von Behring, the discoverer of diphtheria antitoxin, has shown that tubercle bacilli will pass through the mucous lining of the digestive tract of calves without the presence of any injury. Tubercle bacilli contained in fat globules may readily find their way through the intestinal wall in the ordinary process of digestion. When tubercle bacilli are mixed with butter, for instance, this has been shown to occur over and over again. In some of these cases the bacilli were carried directly to the lungs and produced lesions there without affecting any intermediate tissues or organs.

It is very clear, then, that the modern teaching with regard to tuberculosis insists very strenuously on care with regard to food materials and on perfect cleanliness with regard to table ware, the hands and everything that may be brought in contact with food. It might seem that the ordinary habits of cleanliness would be sufficient to guard against infection in such matters. It has been shown, however, that workers in lead suffer from lead poisoning mainly because of the lead they swallow with their food as the result of insufficiently cleansed hands. For a least a week after a man has stopped the use of paint and brushes, washing his hands in the ordinary way every day, lead may still be demonstrated on the ends of his fingers, especially around the nails and over the knuckles. The most important feature, then, of the modern crusade against tuberculosis must be the doctrine of supreme cleanliness. This must be especially enforced with regard to children. If thus enforced we shall hear much less of the heredity of tuberculosis or the supposed hereditary predisposition to the disease than is at present the rule, and there will be a still further important reduction in the death rate from the White Plague of the North.

Population in 1903

Bulletin 7 of the Census gives estimates of population in the cities and towns of the United States having over 10,000 inhabitants. The task of estimating is made difficult by the immense number of cities that have changed their boundaries. Of the 438 cities in the country, with a total estimated population of 25,806,987, there are 163 that have annexed territory between June 1, 1890, and June 1, 1903, to the extent of 387,135 acres. This is an extraordinary movement for centralization. Austin, Tex., has thus taken in 63,781 acres; Chicago, 10,294; Cincinnati, 11,360; Denver, 27,040; Duluth, 37,200; Portland, Ore., 11,798; Spokane, 10,400; Tacoma, 13,104—generally Western and Southern cities—but New York has surpassed their total record by annexing 182,863 acres. In total area New York now leads the list with 209,218 acres, or 327 square miles—more than one-fourth of the size of Rhode Island. Next follows New Orleans with 125,000 acres; Chicago, 122,008, and Philadelphia, 82,933. And these cities, except New Orleans, have the largest estimated population for June 1, 1903: New York, 3,716,139; Chicago, 1,873,880; Philadelphia, 1,367,716, while New Orleans falls behind with 300,625, not so many as Baltimore, 531,313 (19,303 acres); Boston, 594,618 (27,251 acres); Buffalo, 371,731 (26,884 acres); Cincinnati (329,590 (26,880 acres); Cleveland, 414,950 (22,423 acres); Detroit, 309,653 (17,565 acres); Milwaukee, 312,736 (14,327 acres); Pittsburg, 345,043 (18,108 acres); St. Louis, 612,279 (39,273 acres), and San Francisco, 355,919 (29,760 acres). There are, we presume, in Massachusetts and New Jersey, other thickly settled regions where an area no larger than New York or Chicago or Philadelphia, now occupied by several towns, contains a population equal to that

of Philadelphia. The total estimated population of the country in 1903 is 79,900,389; we can now safely call it a round eighty millions.

War as a Cure

"It seems highly probable that war among nations performs very much the same function that a boil does in an individual. There is an accumulation of evil force, of wickedness, of moral poison, which must express itself outwardly or it will fester within and the body will become unwholesome, diseased and die. War, with its inevitable suffering and attendant misery, must carry off, as it were, large masses of bad *karma,* and when it is over even the chief sufferers must have a clearer way open to them for their future higher evolution. So, like everything else in the world, it cannot be wholly evil."

It is quite true that war is not wholly evil, but this well-meaning attempt of the *Theosophical Quarterly* to point out the good in it is fallacious. Were the 630 with whom the "Petropavlovsk" sunk sinners above all Russians in the way of hatred toward the Japanese? Certainly we must exempt Verestchagin, the peace-making painter. In the case of a war like this waged for distant possessions the passions of revenge and hatred are much greater than those which are allayed by it. According to modern psychology the expression of any emotion strengthens it, and the clinching of the mailed fist arouses wrath. According to modern physiology a boil is not due to an accumulation of poison in the blood, but to attack of an external germ. And lastly, we question whether the statement quoted is any more sound from a theosophical standpoint than it is from the psychological and medical. Is it not the teaching of theosophy that bad *karma* is never destroyed by the death of the individual, but must be worked out of the system, like malaria, in some future lives?

Child Labor Reform

Of all the problems now before the American people, there is none that has the arguments more absolutely in its favor than child labor reform. No matter how the issues may be disguised, there is no reason for the existence of child labor, except greed and rapacity. We accordingly welcome the advent of the National Child Labor Committee which was formed last week, and which is composed of some of the most philanthropic men and women in the United States. Up to the present time there has been no national concerted effort to organize a movement to save the children from industrial greed. It has heretofore lacked unity and continuity. Now, we may hope, all this will be changed, and that this committee will act as Lord Shaftesbury did in England, who devoted his long life, ability, wealth and social position to the welfare of the children who toil. We notice that dark as is our industrial history with the exploitation of children's labor there seems to have been a general awakening in the last few years to our criminal negligence, and already many of the States are enacting laws to raise the ages of children allowed in factories and shops, and to shorten their hours of work. Still the work is hardly begun, and no State has yet done everything that it should. The labors of this committee ought not to cease until every child born in the United States has been given a fair common school education before starting out in life's work.

"A Menace to Our Civilization"

This is what Mr. Gompers, in this issue of THE INDEPENDENT, calls the removal of the bars against Chinese immigration. We have heard much about menaces to our institutions or our civilization, and bugbears do not frighten us. We have lived through a greater terror, that of the Know-nothing times, and, later, the A. P. A. times, and nothing has come of all the menaces. And what are these Chinese? Aren't they human beings? Are they any worse than the Japanese, whom we let in freely? Have they not given good pay in work for their money? Has not their work in field and vineyard enriched our Western coast? Here is Mr. Gompers saying No, while our New York Chamber of Commerce is petitioning Congress to indulge in no restrictive legislation, as it will interfere with trade with China. China with its boundless market faces us on the other side of the Pacific. In twenty years it will be well Japanized, and will become, in all probability, one of

the greatest and richest Powers on the face of the earth, perhaps the greatest. Is it not worth while to be on good terms with China, as it is with Japan? Why cannot men look a little farther forward than the inch of their own noses? Mr. Gompers says the Chinese will come to Porto Rico and Hawaii and the Philippines as well as to California. Well, why not? If they are a superior race, let them come and teach us agriculture and thrift. We would not shut them out of the Philippines; let the best win. All these reasons given about "debasement" of the Anglo-Saxon by contiguity of Chinese is a blind. The real objection to the Chinese is the same as the objection to the Hungarians, the Bohemians, the Italians, the Syrians, who are white, not yellow—yes, and to apprentices; it is that they compete for work and wages. Then let them compete. They will take the lowest work and push the earlier comers up higher, as the Italians have pushed the Irish, and all will be for the best of the country. But they are pagan.

Wagner and "Parsifal"

The rights and wrongs of the production of Wagner's "Parsifal" in New York—not to mention less dignified appropriations of the music-drama elsewhere in America—have been written of and talked of these many months; with the not unusual result that one side of the argument never appears to silence the other. Since the last reference to the topic in our own pages, there has appeared in *The Musical Courier,* of this city,—a journal that has been unsparing and outspoken in opposition to the American performances of Wagner's music-drama, on the grounds of good commercial ethics and good taste—the following letter from Wagner. It is dated September 28th, 1880, when he was stopping in Siena, Italy, expressing what would seem indeed a decisive, permanent protest against the production of the work anywhere except at Baireuth, as well as pointing out unmistakably his aim in the libretto to deal allegorically with the history and mystery of Christianity. The letter first appeared in *The Baireuther Blätter.* Wagner writes:

"I have been asking myself seriously how I can rescue this last and most holy work of mine from the fate of a vulgar operatic career. A decision is rendered imperative by the fact that I am unable longer to conceal the real subject of my 'Parsifal.' How can and dare there be produced in theatres like ours, and together with a mixed opera repertory, a story (Handlung) in which the most exalted mysteries of the Christian religion are depicted in the open scene? I could well understand that the Church might object to the performances of these sacred mysteries on boards where yesterday and to-morrow Frivolity holds sway, and before a public which is attracted only by that same Frivolity. Because of this feeling I entitle my 'Parsifal' a 'consecrational festival play.' Therefore I must seek a stage to which I can consecrate the play, and that stage is nowhere else than in Baireuth. . . . Never shall 'Parsifal' be produced on any other stage, and it is my one and only desire to find means whereby I can encompass that end."

Nevertheless we deny the right of musician, author, or inventor thus to deny the world the use of the fruit of his mind.

The cartoons which accompany our article on the Aglipay Schism are copied from a Madrid journal, and we reproduce them, not to indorse the history they would present, but to illustrate the feeling caused in Spain by the promotion to a Spanish see of Mgr. Nozaleda, formerly Archibishop of Manila. Whether the friars were as lank and hungry as the first cartoon represents when they left Spain we cannot say; certainly many of them led a far more useful life in the Islands than would appear from the second cartoon. Certainly the third cartoon is quite wrong; our Government never kicked one friar out of the Islands; it was the people that would have none of them, and so they scuttled out, for their own good and that of the people.

We regret to record the death of Grace Greenwood, as she was universally known, really Mrs. Sara Jane Lippincott, at the age of eighty. She was a favorite newspaper correspondent and general writer on current themes from the days before the Civil War, and had a wide acquaintance and correspondence with distinguished people. Of late she has lived in retirement at New Rochelle, N. Y., and we have been glad to publish a number of her reminiscent articles on the statesmen of those days.

Financial

The Coming Canal Payments

WITHIN a short time, our Government must pay $40,000,000 to the Panama Canal Company, and $10,000,000 to the Republic of Panama. The money is at hand. Foreseeing this demand, Secretary Shaw some time ago caused a little more than $30,000,000 of the Government's money, then deposited with the banks of the country, to be concentrated in the depository banks of this city. This money will be used, and with it about $20,000,000 of the free cash balance now in the Treasury. There is a marked difference or vagueness of opinion as to the quantity of gold that will go out of the country in settlement of these obligations. Probably only $2,000,000 will be taken by Panama, for it is understood that the Republic will leave $8,000,000 here to be invested in Government or railroad bonds. The prediction was made some months ago that perhaps half of the $40,000,000 due to the French company would remain here, partly because, as it was said, much of the company's stock was now owned here. At the present time, however, a majority of those whose opinions have weight appear to expect that large shipments of gold to Paris will be made. The loan market is unattractive here, with money on call at only 1 per cent. and time money commanding very low rates. On the other hand, the expected negotiation of a Russian loan in Paris makes a demand there for gold at rates that are profitable. On Saturday last, $4,000,000 in gold was engaged for export to Paris on Tuesday of this week, and other shipments will probably follow.

Fortunately, the condition of the banks and of the local money market is such that the payments and exports, it is generally believed, will cause no considerable disturbance. Last Saturday's statement showed that the New York Clearing House banks (with deposits for the first time exceeding $1,100,000,000) have a surplus reserve ($34,000,000) larger than in any other year since 1898, at this season. A year ago the surplus over legal requirements was $11,000,000; two years ago it was $9,500,000. Payment is to be made to J. P. Morgan & Co., who are the fiscal agents here of both the Panama Canal Company and the Panama Republic. But the title deeds and contract of sale must first be inspected and approved by Attorney-General Knox.

THE pig iron output has been rising, as the following figures show: December, 846,695 tons (the low record); January, 921,231; February, 1,205,449; March, 1,465,507.

Railway gross earnings for the first quarter of the year show a decrease of a little more than 1 per cent. For the month of March the decrease was only one-twentieth of 1 per cent.

....Edward T. Perine, Treasurer of the United States Mortgage and Trust Company, was last week elected General Manager and Treasurer of the Audit Company of New York, of which August Belmont is Acting President, and William A. Nash, John J. Mitchell and George W. Young are Vice-Presidents. Mr. Perine was cashier of the United States Mortgage and Trust Company in 1893. From 1897 to 1901 he was Secretary and Treasurer of the Audit Company.

....That very useful and trustworthy manual, the "Directory of Directors" (for 1904) has just been published by the Audit Company of New York. This year's issue is larger than last year's by 100 pages. It consists of an alphabetical list of Directors or Trustees, with New York City addresses, followed by the names of the companies with which each is connected; and an appendix containing selected lists of corporations in banking, insurance, transportation, manufacturing and other lines of business, alphabetically arranged, accompanied in each case by the names of the company's principal officers and all its Directors or Trustees.

....The Mechanics' National and the Leather Manufacturers' Banks having combined under the name of the

Insurance

The Occupations of Life Insurance Policy Holders

THE National Life Insurance Company, of Montpelier, Vt., has issued an interesting classification giving the occupations of persons to whom policies have been issued by it during 1903. Farmers and merchants preponderate as purchasers of life insurance, as has been the case in previously compiled lists of a similar character. Next in point of magnitude is the group of "accountants, bookkeepers, clerks and stenographers." Professional men, including "clergymen, lawyers, physicians and dentists," follow closely as to numbers. Women are seen to be extensive purchasers of life insurance, and this may be regarded as quite in line with progress and in keeping with modern ideas. A complete list of the lives insured last year by this company shows a total of 9,935. The distribution of risks assumed during 1903 by ... dge of the tional Life, according to ... s) has allows:

Farmers	.....
Merchants	..1,038
Accountants, bookkeepers, ...ographers, clerks	947
Clergymen, lawyers, physicians, dentists	756

Vol. LVI NEW YORK, THURSDAY, MAY 5, 1904 No. 2892

Survey of the World

The Field of Politics

Many prominent and influential Republicans now expect that Speaker Cannon will be nominated for the Vice-Presidency. It is well understood that Senator Fairbanks does not want the place. The recent Republican convention in his State, undoubtedly in acc[illegible] with hi[illegible] wishes, refrained from [illegible] to the party as a candid[illegible] nation. Mr. Cannon sit[illegible] nestly objects to the d[illegible]cu[illegible] sible candidacy, and threa[illegible] peremptorily the non [illegible]natio[illegible] made. Party leaders, howe[illegible] are [illegible] clined to disregard his wish[illegible] elieving that his popularity would ad[illegible] gth to the ticket, especially in Illi[illegible] re the labor union influence has [illegible]ert[illegible] against Mr. Roosevelt on [illegible]t of hi[illegible] stand for the "open shop" [illegible]ne Mill[illegible] case. On the Democratic side, the a[illegible] tude of Mr. Bryan excites much discussion, many saying that he would bolt t[illegible] ticket if Judge Parker should be nominated. Answering a question as to his purpose, addressed to him by a Democratic Club in Indiana, he declined to commit himself, adding that no self-respecting man could say in advance of a convention that he would support the nominee, no matter who he might be, or the platform, no matter what it might contain. In New York, the Democratic State Committee has selected for its chairman Cord Meyer, a millionaire whose sugar refinery was one of those that were combined in the Sugar Trust. He is interested in several banks and in corporations whose business is directly affected by the protective tariff. Altho a member of Tammany, his election was not suggested or approved by the Tammany leader, who declined to serve on the Executive Committee because his political foe, Senator McCarren, was made chairman of it. Some Democratic papers that support Judge Parker complain loudly because the recent convention placed at the head [illegible] the [illegible]ectors' ticket James T. Woodward, [illegible]esident [illegible]f a bank, who was interested [illegible] Morgan in the syndicate that [illegible] bond issue during Mr. Cleve[illegible]d term. August Belmont [illegible] t syndicate, and his recent [illegible] the movement for Judge [illegible]bject of criticism in Mr. Hearst[illegible] which publish a letter sent by him to influential Democrats in the West, urging them to support Judge Parker and thus assist "our efforts to [illegible]inate Hearst as a possible candidate [illegible] a disturbing element." J. Z. Woods Merrill, of Kansas City, formerly an intimate political friend of Mr. Bryan, asserts that the latter desired the nomination of Judge Parker as his associate on the ticket in 1900, saying that he regarded the Judge as "an able, conscientious and energetic statesman, broad minded and full of progressive ideas." Mr. Merrill publishes a letter received by him from Mr. Bryan on May 14th, 1903, in which he said: "I am investigating Judge Parker, but I think there is no general objection that applies to him."—Prosecuting Attorney Folk, answering questions concerning Bourke Cockran's suggestion that he should be nominated for President, says that he could not accept the nomination if it should be offered, because he regards the work to be done in the office of Governor of Missouri as of very great importance. He

could not desert those who have supported his candidacy in Missouri for "anything else in the range of possibility."—George Fred Williams, the leading advocate of Mr. Hearst in Massachusetts, failed to be elected a convention delegate in his own district.—Lieut. David Boyd, who while in charge of the naval recruiting station at New Orleans refused to accept negroes, has been relieved, the Navy Department holding that he misrepresented its policy. Boyd says he was instructed to take only such applicants as were of the best grade; that the negroes were not of such grade, and that the acceptance of negroes repels white applicants. The New Orleans press is angry and has warned whites to refrain from applying.—The cases involving the suffrage restrictions in Virginia have come to nothing in the Supreme Court. They related to applications for writs to restrain the Board of Canvassers from canvassing the returns of the Congressional election in 1902. The court says nothing can be done, as the retu[illegible] have been canvassed and the Ho[illegible] Representatives (the sole ju[illegible] qualifications of its member[illegible] cepted the persons to wh[illegible] of election were issued.

Close of the Session of Congress

The session of Congress ended quietly at 2 P. M. on th[illegible] 28th ult. It was the shortest of the "long" sessions in forty years. Such a session has once been prolonged to October 20th, and the average length would call for adjournment in the first week of July. Official statements show that the session's appropriations (for the fiscal year beginning with July next) were $781,574,629, including about $26,000,000 for deficiencies in the current year and $56,500,000 for the sinking fund; so that appropriations for the actual expenses of the year were $698,272,786. It is estimated that the revenue will be $704,000,000. In the closing hours the total of appropriations was a subject of partisan debate. During the last week of the session there was much talk designed for publication in the *Record* and to be used in the approaching campaign. The most interesting of the debates was one between Mr. Bourke Cockran and Mr. Dalzell, the bitterness of it being due to Mr. Dalzell's assertion or insinuation that Mr. Cockran was paid by the Republican committee or leaders for his speeches against Bryan in 1896. This discussion was of a distinctly personal and abusive character. Mr. Dalzell could produce no proof, and Mr. Cockran asked for an investigation. This was denied by a party vote. The customary resolution of thanks to the Speaker, offered by the Democratic leader, was notable for the breadth and depth of its commendation. Hearty support was given to it by all. No very important legislation, outside of the supply bills, was pending in the closing days of the session. For the government of the Panama Canal zone full power was given to the President. A joint commission of five Senators and five Representatives (six are Republicans) was appointed to inquire concerning the merchant marine and ship subsidies. Senator Ga[illegible] airman. The proposed [illegible]rning subsidiary silver [illegible]thdrawn. Action upon [illegible]abor bills was deferred. [illegible]er bills upon which final [illegible] taken were those relating [illegible], delegates from Alaska and Porto Rico, pure food, consular reform and th[illegible]rotection of the President. An a[illegible]nent excluding immigrants brou[illegible]ransportation companies under co[illegible] with a foreign Government, and aime[illegible]t the Cunard Company's recent contract with Hungary, was stricken out in conference. Upon the nomination of Dr. Crum, to be Collector at Charleston, no action was taken. Immediately after adjournment the appointment was renewed by the President. It will be considered promptly at the beginning of the next session.

St. Louis Exposition Opened

Under a cloudless sky and in the presence of a vast audience the Louisiana Purchase Exposition was formally opened on Saturday last. Before 6 P. M., 237,000 persons had entered at the gates. In the morning the exercises were begun at the base of the Louisiana Monument with prayer by the Rev. Dr. Gunsaulus, of Chicago, and a brief address from Mr. D. R. Francis, President of the Exposition. After the formal transfer of the buildings to the

Director of Exhibits, Mr. Edmund Clarence Stedman's "Hymn of the West" was sung by a large choir. At the conclusion of the ceremonies, a little after one o'clock, Mr. Roosevelt in the White House touched an electric button, thus starting the machinery and turning on the water for the great cascades that pour down from Festival Hall to the lagoon. In the address of Mr. E. H. Harriman, President of the New York State Commission, who spoke for the domestic exhibitors, an interesting reference to railroad combinations was made. It will be remembered that Mr. Harriman, the head of the allied Union Pacific and Southern Pacific roads, was interested on the side of the defense in the Northern Securities merger case. He said:

"The combination of different railways should be regulated by law. So far as may be necessary, the public interest should be protected by law, but in so far as the law obstructs such combinations without public benefit, it is unwise and prejudicial to the public interest. I do not deny that such unfriendly and obstructive legislation may have been in part caused by unwise and arbitrary acts of railway managers, but the evolution of experience has largely removed the conditions which produced a conflict between State and railway interests, and the time has certainly come when the State should no longer unnecessarily burden or obstruct these interests, but should co-operate in improving the condition of transportation."

Secretary Taft, who represented President Roosevelt, in the course of his address directed attention to the new expansion, involving the solution of other and different problems from those presented in the Louisiana Purchase, problems that "must be solved with the same high sense of duty, the same fearlessness and courage with which our ancestors met" those of a century ago:

"That they may not, and probably will not, be solved by conferring Statehood upon the new territory is probable. Augurs of ill and ruin to follow from the experience and the solution of the problem are not wanting, but they never have been wanting in the history of this country, and they never have been allowed to control the fearless grappling of new problems by Americans. Those who look forward with dark foreboding to the result of this new adventure base their prophecies of disaster on what they think is the weakness of the American people. Those who look forward to its success base their judgment and their optimism on what has already been accomplished in the Philippine Islands, and on what they know the American nation can do when an emergency and an inevitable necessity present themselves."

The Mormon Polygamists

At the hearings in the Smoot inquiry at Washington, last week, it was shown that Apostle Heber J. Grant had been sent by Governor Wells, of Utah, to represent the State at the Kindergarten Conference in Berlin, and that Grant started suddenly in the night to avoid a warrant for his arrest on the charge of polygamous association. The Governor's sister is one of Grant's plural wives. Addressing the students of Utah University, Grant said that he had given to that institution $50 for himself, $50 for one of his wives and $50 for another, and that he regretted that the law would not permit him to take more wives. He is now in Germany. The United States Marshal has been unable to find Apostle John W. Taylor, who is wanted as a witness. Taylor is said to be in Canada. He has five wives, and two of them are twins, not more than 24 years old, who had been domestic servants of his older wives. It is plain that he must have married these young women since 1890, when the Church forbade plural marriage by its Manifesto. Some think that he married them in Mexico or Canada. One of the witnesses before the committee was Moses Thatcher, formerly an Apostle, who offended the Church authorities by being a candidate for the office of United States Senator and was compelled to resign his office in the Church. He said he was still a Mormon, but was not permitted to enter the Temple. He admitted that the Church had exerted strong influence to prevent his election. If any Mormon, he added, should run for office in opposition to the wishes of the Church the result might be the same as in his own case; but "a free American citizen" had a "right to retire from a Church office," and he believed that "every man who loved his country" would resign his office in the Church in such circumstances. Judge Powers, testifying again, commended the Mormons for their good schools, their interest in the arts and sciences and their toleration of other religions. In 1900, however, he perceived that popular sentiment was inclined to question the good faith of their renuncia-

tion of polygamy. President Smith writes to the committee expressing his regret that he cannot procure the attendance of Abraham Cannon, Apostle Grant, George Teasdale, Lillian Cannon and several others, whose testimony, it was thought, would disclose polygamous marriages made with the consent of the Church since 1890. The committee will pursue its inquiry during the summer in Utah.

President Mellen on Unions

The boiler makers in the shops of the New York, New Haven and Hartford Railroad Company went on strike about ten days ago. They had demanded nine hours instead of ten, with a wage increase of 15 per cent. The company would concede the nine hours, but not the increase of pay. It brought 200 non-union men to the New Haven shops and gave them lodgings on a steamboat. The road's 1,000 machinists and 3,000 car-workers had made similar demands, and all of them may soon go on strike. Addressing a Workingmen's Club in Hartford, on the 28th, the company's new President, Mr. Mellen, expressed his opinions about unions. He was a workingman himself, he said, and he spoke of the privations and labors of his early life. This was the age of the workingmen. Among them were the captains of industry of the future. Men of affairs were looking for these, but they sought quiet workers, not talkers and trouble-breeders. Unions had accomplished much good, but were not an unmixed blessing for the laboring man. They tended to discourage individual effort. "They are a good thing for the drones, the inefficient, the walking delegate, and the officers, but are unnecessary for the man who has the stuff and courage in him to carve his own way in the world." They helped the lame, the halt and the weary at the expense of the really competent. Divested of all claptrap, the union was simply a means of averaging wages, a device for making those who were willing to work care for those who wanted to "soldier." But unions had come to stay, and he expressed the wish that the company's men generally would join them. Not that he would run a union plant as such, but he wanted to have in the unions "the conservative influence of many of the good men who are out, to counteract the floater, the anarchist, the man who has nothing at stake in the world, who works with his mouth more than with his hands." The trouble with unionism was its intolerance, like that which prevailed long ago in religion. "The cry of 'the union or the hospital' has its counterpart in that older one of 'the Church or the stake.'" He urged union men to avoid violence, which hurt their cause immeasurably. The rule of seniority was a bad one, repressive and oppressive. Organized labor had forced into existence the Trusts and combinations for protection from exaction. Capital would not seek investment where nothing but loss and controversy was to result. "Given all your hotheads seek, and corporations must be run by the Government. The hothead must be retired, or in the contest in which he will involve you, all of you will go down in defeat. Education and brains will outweigh numbers and brawn." He advised all who had families and a stake in the world to join the unions and make themselves felt as a conservative force. Progress would be attained not by securing an increase of wages here and there, but by drawing the attention of the best minds to a study of conditions that caused unrest. He had seen much to deplore in the arbitrary and unreasonable conduct of persons in authority dealing with unions. The head of a corporation could not satisfy his directors and stockholders if his expense account were larger than those of his neighbors in the same line of busines. Business was falling off in New England, day by day, but his political friends unwisely opposed reciprocity with Canada. "I would not strike for money, but only to resent injustice, and none of our men need strike for that reason while I am in authority." No one was more worried than himself over the tendency of modern business development. He regretted the passing of the small merchant, the small manufacturer, the man who worked in his shop with his own hands, and whose employees were as welcome at his table as the best in the world. He believed the progress of the United States was largely due to such men. It was with apprehension that he saw them disappear,

"but shall I struggle against the inevitable," he asked, "or adjust myself to the new conditions and perhaps help to shape and influence them for the better?"

President Loubet Visits Rome

The visit of King Victor Emmanuel to Paris last October was returned by President Loubet last week. The President, accompanied by M. Delcassé, Minister of Foreign Affairs, and a number of French officials, went to Rome by rail April 24th and returned from Naples on the French cruiser "Marseillaise" April 29th. The party were received at the Italian frontier by representatives of the King, and at the station by the Mayor of Rome, the Prince of Colonna, the King, the Duke of Genoa, the Count of Turin, members of the Italian Cabinet and representatives of the Senate and Chamber of Deputies. Along the route to the Quirinal were massed 500,000 people, and the enthusiasm of the crowd assembled on the plaza in front of the palace was so great that President Loubet, King Victor Emmanuel and Queen Helena had to appear on the balcony three times. In the evening the city was illuminated and a torchlight procession of 15,000 persons passed the Quirinal. On the following day the President went to the Pantheon to lay wreaths on the tombs of King Victor Emmanuel II and King Humbert, where he was received by the veterans of the Italian army. In the evening a royal banquet was given at which the two rulers exchanged congratulations over the close and amicable relations now existing between Italy and France, as emphasized by the recent treaties of arbitration and reciprocity. In the evening a gala performance was given at the Theater Argentina. On the 26th President Loubet reviewed 20,000 troops in the Piazza d'Armie, on his return passing through the Piazza di Spagua, where the steps leading up to the Church of Trinita de Monti were completely covered with flowers. In the afternoon he visited the Forum, where Professor Boni excavated three tombs. At the receptions United States Ambassador Meyer, and Charlemagne Tower, Ambassador to Germany, and Andrew D. White, the former Ambassador to Germany, were shown especial favor. At Naples the principal event was the naval review, where the Italian and French fleets joined in the evolutions. There were immense numbers of visitors in the city, and it is estimated that 20,000 people were unable to find lodgings for the nght. It is quite as important to note that the tour was not marred by any of the manifestations of political and religious antagonism which were so generally prophesied. There was no anarchistic attempt at assassination. The plan of the republicans and socialists to hold an anti-clerical mass meeting was not carried out. The Pope issued no protest against the reception of the President at the Quirinal, altho this is the first time that the head of a Catholic Power has visited there since the Pope was expelled from it. As a counter demonstration it was proposed that all loyal Catholics assemble for prayer in St. Peter's at the time when President Loubet arrived, but this was given up, it is said at the desire of the Pope.

The Jews in Russia

Very strong evidence has been published to the effect that the Russian Government intends to moderate the anti-Jewish legislation, particularly the restrictions on residence outside the Pale and educational privileges. Last fall the Minister of the Interior, Plehve, sent a circular of inquiry to the provincial authorities to discover the causes of Jewish discontent and hatred of the Government. In most of the replies it was pointed out that the evils resulted largely from the overcrowding of the Jews in cities and in a few industries, and the ignorance of the rabbis, who were shut out from the higher schools and not allowed to establish schools of their own. The reports from the seven provinces in which Jewish colonies have been formed are of especial interest as bearing on the old question of the efficiency of the Jew as an agriculturist. Three of the provincial Governors report unfavorably on the project, and state that the Jews will not do farm labor. The other Governors reports that with certain changes in the land laws the agricultural settlements can be made successful. The Governor of Cherson, altho an anti-Semite, says that there is no doubt of the ability of the Jews to cultivate the land,

and that in this province 73 per cent. of them are engaged in agriculture. A circular issued to the provincial authorities by the Ministry of the Interior, Department of the Police, admits the painful consequences of the attempt to confine the Jews within the zone established for their residence, and the injuries done to individuals by expelling them from localities where they have long resided, owing to defective laws and conflicting interpretations of them, in these words:

"In these circumstances it would seem scarcely in harmony with the principles of justice to throw on the Jews all the responsibility for the consequences resulting from their illegal residence outside the zone where they should be confined. This is especially the case at the present time, when the unhappy situation of the expelled Jews is aggravated by the military events occurring in the Far East.

"In view of this state of affairs, and being anxious to remove all that, at the present difficult moment, might disturb the normal course of life in the interior of the Empire, and provoke, in a number of cases, discontent among the population, I consider it necessary to suspend, till peace is restored, the expulsion from their actual places of residence of those Jews whom the local authorities have reported as living illegally in localities where they were formerly authorized to settle, but where this permission has subsequently been withdrawn; the same leniency may be shown to Jews who have lived for a long time outside their legal zone of residence and have a house and family.

"But I should add that the necessary condition for the application of these measures should be the receipt, from the administrative authorities concerned, of an assurance that the Jew whom it is proposed should be allowed to remain in a locality where, according to the law, he should not reside is not doing anything likely to disturb public order, and that he does not provoke discontent among the surrounding population."

The final judgment in the Kishenef cases was pronounced April 25th, a year after the massacre. Two men, Rusneke and Bodijan, were found guilty of the murder of a Jewish couple named Forrarji, one being sentenced to four years' and the other to twenty years' imprisonment. Fifteen persons were found guilty of rioting and condemned to a year's imprisonment. Thirty-six were discharged. The demands for damages on account of destruction of property, more than 300 in all, were thrown out of court without consideration. Neither the witnesses nor prosecuting attorneys were protected in their right of free speech. Sokoloff and Wolkenstein, two of the lawyers who took part in the trial, were banished into the interior for their protests against the proceedings. A Christian witness, Gourier, Councillor of State, who testified in favor of the Jews, was forced to resign his post as manager of convents in Bessarabia on account of his testimony in the case.

The Vladivostok Squadron

The squadron from Vladivostok, cruising off the eastern coast of Korea about 150 miles north of Gensan (Wonan), caught and sank a Japanese transport, the "Kinshu," which had become separated from the fleet during a fog, and, mistaking the Russian vessels for Japanese, approached them to bring them coal. The Russians captured altogether 17 officers, 20 soldiers, 85 coolies and 65 of the crew; but over 200 of the soldiers shut themselves below deck and refused to surrender. The Russian boarding party then withdrew and a torpedo was exploded under the vessel. The Japanese then rushed upon deck and continued firing upon the Russians until their ship was sunk by a second torpedo, which exploded the boilers. Many of the Japanese officers and soldiers committed suicide rather than be saved by the Russian boats. According to Japanese reports the number lost was only 73. The "Kinshu" was a 4,000-ton merchantman, carrying rice and other military supplies, including 1,500 tons of coal, and was armed with four Hotchkiss guns of 1.9-inch caliber. Besides this the Vladivostok fleet sank two small Japanese steamships, the "Goyo Maru" and the "Nakamura." The crews of both were taken off.

The Passage of the Yalu

The first important land battle of the war took place on Sunday, May 1st, and resulted in a complete victory for the Japanese, giving them the control of the whole estuary of the Yalu River. The Russians have burned Antung and retreated to Feng-Wang-Cheng, which is on higher ground and nearer the railroad, where it is understood they will make their second stand. The passage of the Yalu was effected by means of pontoon bridges

on which the Japanese crossed at the two points north of Wiju, concentrating their forces for an attack on Kiuliencheng (Chiu Tien Chang), which was the most important Russian position, since it dominated Antung and commanded the road to Pekin. The movement was begun on April 26th, when detachments of the Imperial Guards and the Second Division crossed over the shallow channel to the islands a little north of Wiju. During the next two days there was skirmishing at many points along the river, where the Japanese had landed, and the Russians bombarded the fortifications of Wiju and vicinity at long range from the Manchurian side, but doing a great deal of damage. To the Twelfth Division of the Japanese forces was assigned the duty of crossing at Suku, and at about 3 o'clock on the morning of April 30th the pontoon bridge was completed at this point, when the Japanese crossed with heavy artillery and took a position on the Russian left flank. By heavy bombardment the Russian batteries at Kiuliencheng were silenced and the Russian outposts driven back, so that the landing could be effected from the island opposite Wiju. While this was being done a flotilla of gun boats from the squadron of Admiral Hosoya passed up the Yalu and dislodged the Russians from a position on the low hills below Antung. At eight o'clock on Saturday night the bridge across the main stream of the Yalu just above Wiju was completed, and a second division

Map of the Yalu River, Showing the Bridge by Which the Japanese Crossed

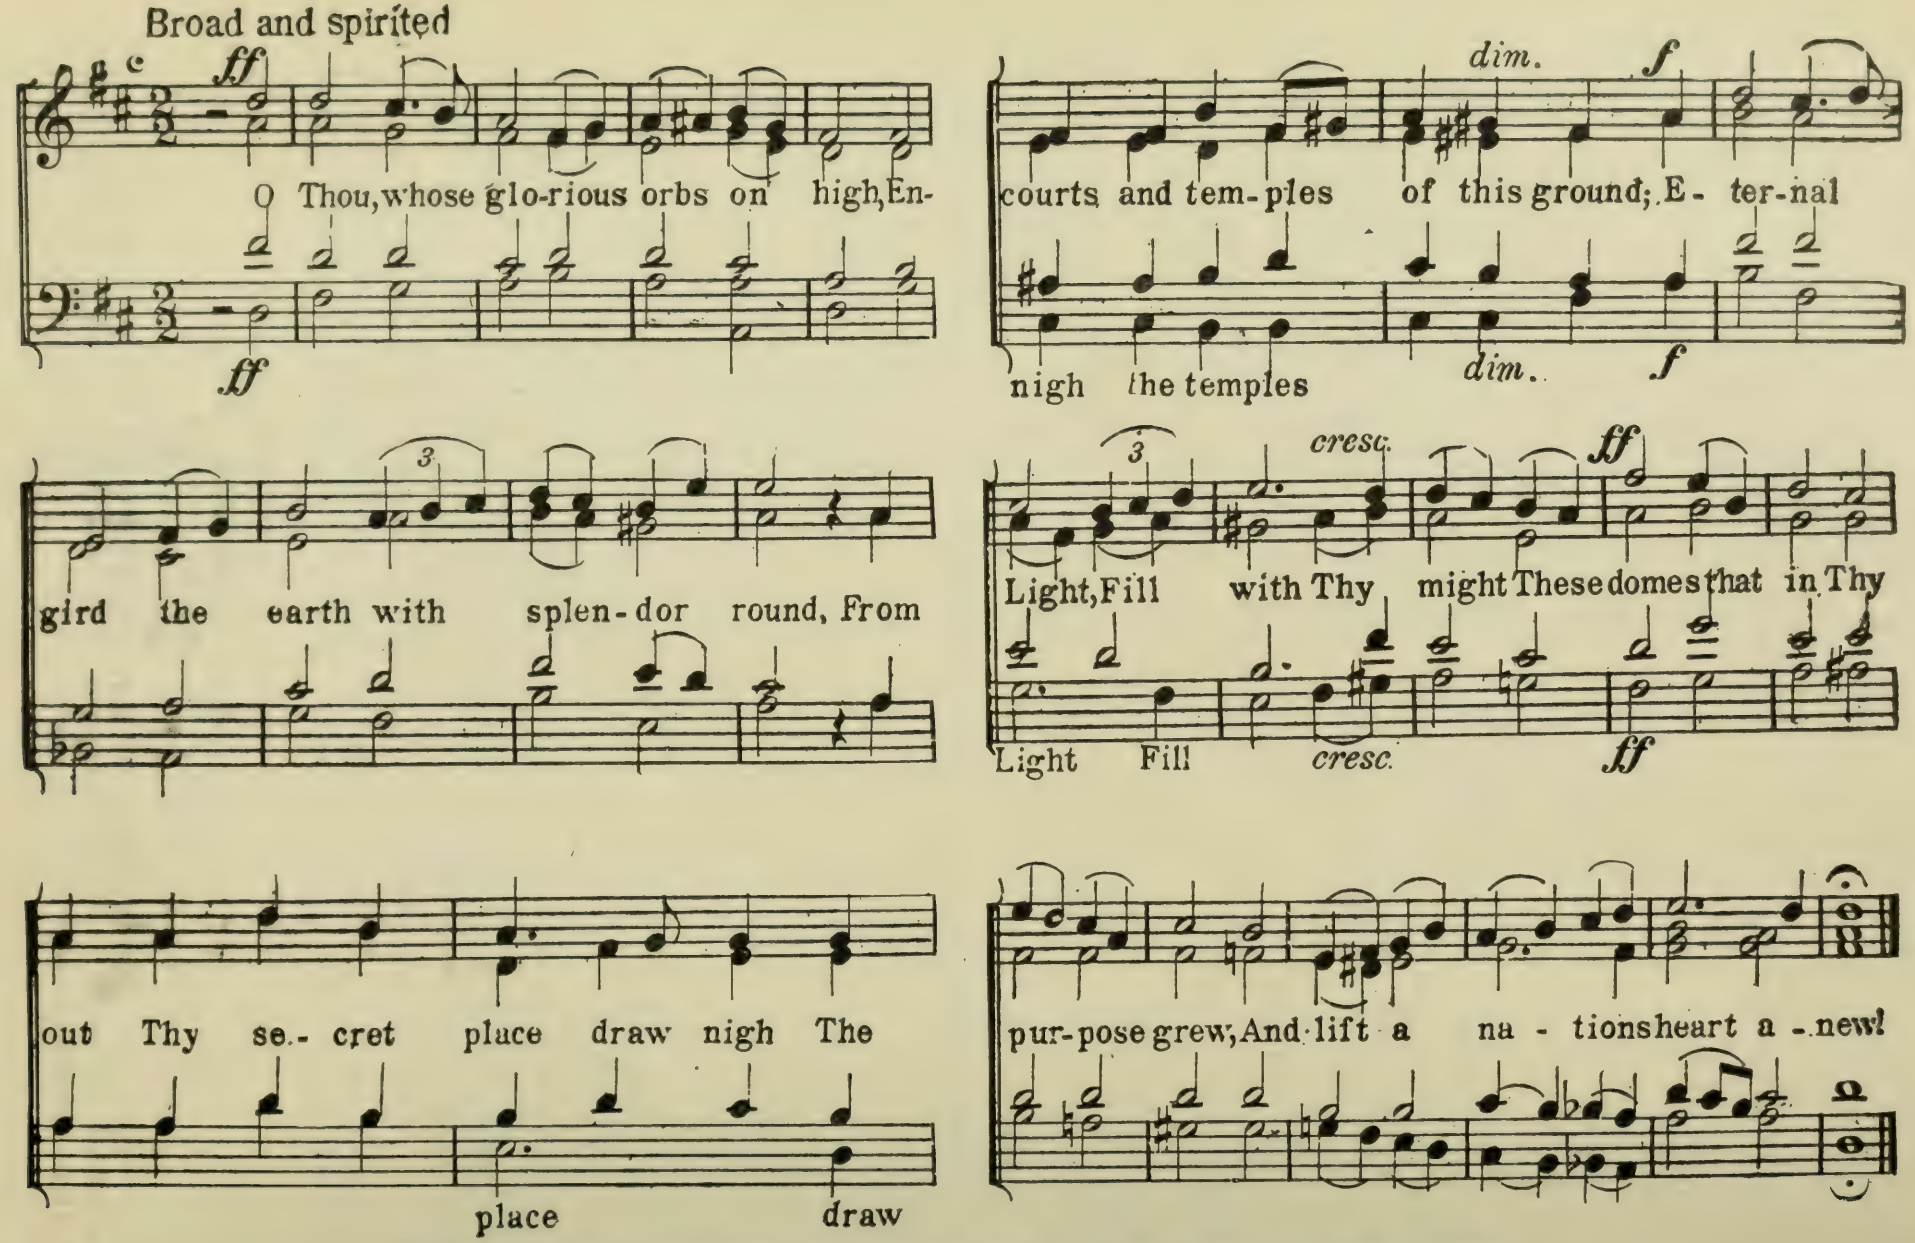
of the Imperial Guards crossed over during the night, taking up a position upon a high point near Chosan (Kusan). On the morning of May 1st the Russians were in a line of about four miles long on the right bank of the Yalu, north of Antung. The Russian forces centered at Kiuliencheng included all of the Third Division, two brigades of the First Division, one cavalry brigade, with about forty quick firing guns and eight machine guns. By a general charge the Russians were driven from their position and forced to retreat with a loss of some 800 men. The Japanese captured more than twenty commissioned officers, twenty-eight quick firing guns and a large quantity of arms and ammunition. The casualties on the Japanese side are probably nearly equal in number to those of the Russians. The attack was ordered by General Kuroki at half past seven. The Japanese infantry charged across the river, wading breast deep, and stormed the hights. By nine o'clock they had swept the Russian line back across the plateau. The engagement is considered a very important victory by the Japanese, but is minimized by the Russians, who claim that there was no intention of holding the Yalu, but that their only object was to delay the advance of the Japanese by contesting each vantage ground on their retreat.

Hymn of the West*

BY EDMUND CLARENCE STEDMAN

O Thou, whose glorious orbs on high
  Engird the earth with splendor round,
From out thy secret place draw nigh
  The courts and temples of this ground;
    Eternal Light,
    Fill with thy might
  These domes that in thy purpose grew,
  And lift a nation's heart anew!

Illumine Thou each pathway here,
  To show the marvels God hath wrought!
Since first thy people's chief and seer
  Looked up with that prophetic thought,
    Bade Time unroll
    The fateful scroll,
  And empire unto Freedom gave
  From cloudland hight to tropic wave.



Poured through the gateways of the North
  Thy mighty rivers join their tide,
And, on the wings of morn sent forth,
  Their mists the far-off peaks divide.
    By Thee unsealed,
    The mountains yield
  Ores that the wealth of Ophir shame,
  And gems enwrought of seven-hued flame.

Lo, through what years the soil hath lain
  At thine own time to give increase—
The greater and the lesser grain,
  The ripening boll, the myriad fleece!
    Thy creatures graze
    Appointed ways;
  League after league across the land
  The ceaseless herds obey thy hand.

Thou, whose high archways shine most clear
  Above the plenteous Western plain,
Thine ancient tribes from round the sphere
  To breathe its quickening air are fain:
    And smiles the sun
    To see made one
  Their brood throughout Earth's greenest space,
  Land of the new and lordlier race!

Unpublished Letters*

BY HERBERT SPENCER

TO BE PUBLISHED IN THREE INSTALLMENTS

With an Introduction by George Llewellyn Rees

THE following letters, heretofore unpublished, were written by Herbert Spencer to two Brooklyn friends. Spencer wrote without thought of publication—in fact, stipulated that his correspondence should not be published—presumably during life. He never corresponded promiscuously, and what he sent out he dictated, only the signature being in his handwriting. Often the most ordinary paper was used by him, and both sides of the sheet were written upon. Months would elapse when his closest friends received only four or five lines, often dictated from the sick bed. How little opportunity he had for making letter writing an art may be judged from this extract from a letter:

"How much an invalid I have been for a long time past you may judge from the fact that until about two months ago I had not seen my most intimate lady friend for a year and a half, tho she wished to see me." (June 8th, 1894.)

In another letter he says that ordinarily he cannot stand over a few moments without experiencing a weakening of the heart. He again replied rather testily to his friends that they must not, in view of his extreme delicacy, bother him for an expression of his opinions on more or less irrelevant and pedantic matters. Later he left off letter writing altogether, except to the very few, and answered correspondence with the well-known printed circular thanking the correspondent for his good will, but begging, on account of ill-health, to be excused.

Some of these letters are severe, but any severity of tone he employed was barely whispered, as it were, into the ears of bosom companions, and does not detract from the sweetness of soul which was truly his. Let us recall the words of those who knew him best. Said George Eliot:

"He is a good, delightful creature, and I always feel better for being with him."

George Lewes said:

"My acquaintance with him was the brightest ray in a very dreary, *wasted* period of my life. I had given up all ambition whatever, lived from hand to mouth, and thought the evil of each day sufficient. . . ."

Most of the letters bear upon the "George business," as Spencer bitterly characterized it. I am aware that his detractors will seize upon them. His friends, on the other hand, will be glad for this expression of his human side, and it will serve only to magnify his virtues. The fact that Spencer was the most pathetically beautiful character—"the most heroic figure of his time"—the fact that every line of the "Synthetic Philosophy" is an appeal for individual rights, that his temperament was nothing if not intense, that unjust imputations rent still further a ragged nervous system—all these things will count for nothing with the detractors who will rise up.

The letters were addressed to James A. Skilton, whose death occurred a few weeks ago, and Dr. Lewis G. Janes, late President of the Brooklyn Ethical Association. With the exception of John Fiske and Professor Youmans, these men were Spencer's closest American friends. Mr. Skilton spent the good part of a fortune in gratuitously distributing Spencer's works when the genius of the great philosopher was unknown to America. The two men did much close-range fighting, as it were, for the doctrine of evolution, and other of Spencer's ideas—in the press, from the forum, etc.—while their great master remained behind the firing line, often directing the battle, as the letters will reveal. As Secretary of the Brooklyn Ethical Association Mr. Skilton prevailed upon Spencer to accept honorary membership, a compliment the philosopher paid to no other learned body.

* Copyright, 1904, by THE INDEPENDENT.

Dr. Janes was perhaps the most sympathetic and intelligent interpreter Spencer had in America. His position as President of the Association—which might be regarded as the first society in the world devoted to the promulgation of Spencer's theories—brought him in touch with the master.

The recipients of the letters are now deceased, tho the full consent of the heirs has been obtained for their publication.

Brooklyn, N Y.

Part I.—Miscellaneous Letters

[The letters included in this installment were written from various addresses—Dorking, London, Pewsey, in Wiltshire, and Midhurst, in Sussex—and relate to a number of subjects. In the two following instalments will be given the letters relating to the controversy with Henry George. Personal passages referring to health, the sending or receipt of printed matter, and subjects of a like character, have for the most part been omitted. Letters I-VII, inclusive, are addressed to Mr. Skilton. The first relates to certain mechanical calisthenics prescribed by Mr. Skilton, the third to an anonymous attack on Spencerism published in a New York newspaper, the sixth to a congratulatory resolution passed by the Brooklyn Ethical Association and addressed to Spencer.—Editor.]

I.

October 30th, 1888.

Dear Sir: I am much obliged to you for the expression of your sympathy and for the trouble you have taken in writing so long a letter.

But you have not the remotest notion of my state, otherwise you would not give the advice you do. Half a minute's use of the machine would make me ill for a month.

When I tell you that I cannot stand for half a minute without producing intermission of the pulse, and that, if I persist, the result is utterly disastrous, you will see that I am far beyond reach of any such aid as you suggest.

Please excuse brevity. I am obliged to abridge my correspondence, even tho dictated, to the smallest amount possible.

P. S.—You will see that I have relapsed terribly since I wrote to you, but even at the time I wrote the use of the machine would have been ruinous.

II.

March 13th, 1890.

Dear Mr. Skilton: I received your telegram last night, and from the wording conclude that you wish some letter from me about Youmans which Fiske may read in his lecture on the 23d. I am very glad to respond to the request, and I cannot do this better than by giving you the following copy of a passage in my "Autobiography" concerning him:

"The relation thus initiated was extremely fortunate; for Prof. Edward L. Youmans was, of all Americans I have known or heard of, the one most able and most willing to help me. Alike intellectually and morally, he had in the highest degrees the traits conducive to success in diffusing the doctrines he espoused; and from that time to this he has devoted his life mainly to spreading throughout the United States the doctrine of evolution. His love of wide generalizations had been shown years before in lectures on such topics as the correlation of the physical forces; and from those who heard him I have gathered that, aided by his unusual powers of exposition, the enthusiasm which contemplation of the larger truths of science produced in him was in a remarkable degree communicated to his hearers. Such larger truths, I have on many occasions observed, are those which he quickly seizes—ever passing at once through details to lay hold of essentials; and having laid hold of them he clearly sets them forth afresh in his own way with added illustrations. But it is morally, even more than intellectually, that he has proved himself a true missionary of advanced ideas. Extremely energetic—so energetic that no one has been able to check his over-activity—he has expended all his powers in advancing what he holds to be the truth; and not only his powers, but his means. It has proved impossible to prevent him from injuring himself in health by his exertions; and it has proved impossible to make him pay due regard to his personal interests. So that toward the close of life he finds himself wrecked in body and impoverished in estate by thirty years of devotion to high ends. Among professed worshipers of humanity, who teach that human welfare should be the dominant aim, I have not yet heard of one whose sacrifices on behalf of humanity will bear comparison with those of my friend."

Tho the volume containing this passage will not be published until after my death,

I am very willing that this tribute of admiration to my late friend should be made public now.

III.

April 8th, 1890.

My Dear Sir: It is, I think, needful that the letter of "Outsider" and the editorial article upon it should be met. They cannot be allowed to pass unnoticed without injurious implications.

I inclose the draft of a letter which I think might fitly be sent to the New York *Times*. Of course, I put it in your hands to do what you and your friends think most desirable. I presume you are acquainted with Dr. W. J. Youmans, and I think it would be well to consult him. Probably if he were to undertake the reply, either in the form in which it now stands or with such modifications as may be thought desirable, it would be the best. Standing as he does in closer relations to my affairs in the United States through his intimate knowledge of all his brother has done, and being, therefore, publicly understood to be more fully in possession of the facts than any one else, the letter might with advantage issue from him if he consents.

On the whole, the attack may prove to be rather fortunate than otherwise.

IV.

April 25th, 1890.

My Dear Sir: I am obliged by your letter of the 14th with its various pieces of information. I cannot, however, give it the attention it deserves.

Day after day passes without a single line of permanent work being done, and all because of distractions.

You will admit that to make progress with the "Ethics" if possible is more important than to express my opinion on the subject matter of your letter, and I must ask you, for this reason, to excuse me.

Thank you for forwarding the extracts from the New York *Times*. I should think the discussion will be eventually beneficial.

V.

May 3d, 1890.

Dear Mr. Skilton: . . . It occurs to me to say that if Dr. Janes makes any use of the essay on "The Nebular Hypothesis," it will be well not to say anything about the portion which gives tables of the distribution of comets in space, showing their relation to the axis of nebular rotation. I find since the essay was printed that the calculations are open to a criticism which makes it undesirable to base any conclusion on the argument.

My seventieth birthday came in the midst of a relapse, but I am hoping that as soon as the accompanying disturbances cease it will prove to be a short one.

VI.

May 10th, 1890.

Dear Mr. Skilton: Those who in the past have devoted themselves to the diffusion of ideas have usually had much to suffer and have met with little appreciation: they died before it came. Remembering the fates of such, I may regard myself as extremely fortunate. Tho during the first half of my literary career the losses were great and the encouragements small, yet the last half has made amends; and I may be more than satisfied alike with the material results and the effects produced, as well as with the marks of approval which have been coming to me more and more frequently.

Among these last the resolution passed by the Brooklyn Ethical Association, which I received yesterday, is one of the most gratifying and calls for special thanks. . . .

VII.

May 12th, 1890.

Dear Mr. Skilton: This morning I have received from Dr. Janes a letter telling me of your serious accident. I greatly regret alike that you should have so much suffering to go through and that you should be shut out from the activities of life so long, as is probably implied. I hope your general health is good, so that you may be able to bear the constitutional disturbance and so that the powers of repair may act with rapidity.

It is well to make the most of compensations in such cases, and one of those that may be named is the enforced opportunity given for quiet contemplation of life and the world. In the rush of business even with us, and still more with you in America, the incessant turmoil is such as to make almost impossible that quiet thought which should form a constant element in the mental activities of all, and should prevent that absorption in

material occupations which is almost universal.

I shall be glad to have from time to time good reports of your progress.

VIII.

[The following letter relates to the controversy first mentioned in Letter III.—EDITOR.]

TO DR. JANES.

May 12th, 1890.

MY DEAR SIR: . . . I should indeed be a discontented being were I not fully satisfied with the outcome of the controversy in the New York *Times*. My American friends have shown themselves at once energetic and efficient, and the expression of such agreement and sympathy has been cheering to me at a time of life when cheering things are not very common. Your statement of the case is, I think, quite as satisfactory as limited space could make possible. In the paragraph numbered 2, more especially, you have stated quite clearly the Agnostic view as distinguished from the materialistic view, and truly insisted upon the fact that a spiritualistic interpretation might just as reasonably be given to the symbols in which we interpret phenomena as a materialistic one. I wish the New York *Commercial Advertiser* had given the name of the Frenchman who reduced the "Synthetic Philosophy" to mincemeat. Thus far I have remained quite unconscious of this utter destruction which I and my views have undergone.

IX.

TO DR. JANES.

May 4th, 1891.

DEAR DR. JANES: In old times persecuting priesthoods were content if the so-called heretic would recant and say he agreed with them—whether he did at heart accept the belief was a matter of indifference, so long as he outwardly conformed and professed the belief. These tactics have in our days been inverted. Defenders of the established creed, no longer able now to produce apparent agreement by force, exaggerate as much as they can the disagreement, so as to make their antagonists hateful. Persistently ascribing to them views they do not hold, they thus furnish themselves with weapons of offense, and they find the weapons so convenient and effective that no proof that they are false weapons will make them desist from using them.

I have had to rebut the charge of materialism times too numerous to mention, and I have now given the matter up. It is impossible to give more emphatic denial or assign more conclusive proof than I have repeatedly done, as you know. My antagonists must continue to vilify me as they please—I cannot prevent them. Practically they say: "It is convenient to us to call you a materialist, and you *shall* be a materialist whether you like it or not."

In my earlier days I constantly made the foolish supposition that conclusive proofs would change beliefs, but experience has long since dissipated my faith in men's rationality.

X.

TO DR. JANES.

September 7th, 1891.

DEAR DR. JANES: I see they have been carrying on a discussion in the *Open Court* concerning my Agnostic views considered as either materialistic or antimaterialistic. I do not propose to take any notice of the matter myself, nor do I suggest that you should do so to any considerable extent; but it might not be amiss to quote at length a passage from the close of one of the divisions of the "Psychology"—I think the division entitled "Physical Synthesis"—which puts more fully and clearly than any other passage the view I take and disposes more completely of the misinterpretations. I have not the book with me here, but you may, I think, easily identify the passage. It begins with a kind of apostrophe to the spiritualist, showing how crude and coarse is his conception and how much more refined is the conception which affiliates spirit not upon any form of matter, but upon a form of motion. And then the passage goes on to point out that not even this refinement is the one concepted by me. The passage continues by showing (using algebraic symbols) that it is impossible either to interpret matter in terms of spirit or spirit in terms of matter, but that the problem is to the human intelligence insoluble so long as there exists the antithesis of subject and object, and that the ultimate power underlying both cannot be presented under either form.

The passage is a long one, but it might not be amiss to quote it in full and to point what is the cause of the confusion in the minds of my opponents: at the same time that I assert that matter and motion as they exist in themselves cannot be matter and motion as we know them, they persist in importing into their own and into my thought the ordinary conceptions of matter, and thus showing how absurd is the incongruity when consciousness is supposed to emerge from them. If they would keep ever before them the fact which I perpetually assert that matter and motion as existing in themselves cannot be matter and motion as we think them, they would then see that no such incongruity exists as they suppose. But they will constantly import their own gross idea of matter and motion into the midst of my view and then debit me with the incongruity.

I think a letter quoting the passages I have indicated and making this final explanation may be useful.

P. S.—I do not send any part of the above to be quoted. I have not been careful about the wording of it. I leave it simply in the form of a remark for you to present in your own way. I do not wish to appear in the controversy even indirectly.

XI.

[UNDATED.]

DEAR DR. JANES: I have been on my back figuratively speaking and in large measure literally speaking for the past seven months, and am now rather worse than better. I am trying to revise the "Biology," and you may judge my state from the fact that [of] two chapters I am adding to Part I, I have not yet finished the second.

You may hence infer my reply to your letter.

P. S.—I dictate this from bed.

XII.

[The following letter should be read in connection with Letter XVI. The subject mentioned in the last paragraph was subsequently brought up by Mr. Skilton at the Congress for the Study of Evolution at the World's Fair, Chicago, 1893.—EDITOR.]

TO MR. SKILTON.

December 10th, 1891.

DEAR MR. SKILTON: If the Americans can be induced to give up, even in a measure, that hand-to-mouth legislation by which nations throughout all past times have been led to stumble out of one disastrous course into another—if they can be induced to guide their legislation by knowledge of those laws of social development which the rules of nations have thus far absolutely ignored, they will do something to be recorded through all future times.

I am not sanguine that much can be done. The question is essentially one of character, and character can be but slowly changed along with change of social conditions. Nevertheless, it is well worth while to do all that may be done, knowing that efforts made in the right direction will have beneficial results, tho they may not be the results hoped for.

Hence I gladly encourage you and those with whom you are about to cooperate in introducing evolutionary ideas into politics.

XIII.

TO MR. SKILTON.

December 11th, 1891.

DEAR MR. SKILTON: Since writing you yesterday I have read through your program, which, foolishly enough, I had not previously done, but had contented myself with reading your letter accompanying it.

Various of the heads of your program do not give me any distinct ideas of the courses to be pursued, and respecting these I can, of course, entertain no definite opinion; the implication being that I do not wish to express either approval or disapproval of them. Further I note that one of them expresses in a very strong way antagonism to what is understood as Malthusianism, the mode of expression implying both that the theory is wrong and that great mischief has resulted from acceptance of it. To neither of these propositions can I give any adhesion.

If used at all, my letter must not be used in any such way as will imply either directly or indirectly any indorsement of your program.

XIV.

TO DR. JANES.

March 12th, 1892.

DEAR DR. JANES: I have just received from Mrs. Bisbee, of Dorchester, Mass., a letter with inclosures concerning her

work, and I have replied to it to-day as follows:

"In efforts toward ethical culture there is constantly overlooked the one effort more important than all others—the effort to suppress militancy. Abundant proof exists that with war come all the vices, and with peace come all the virtues.

"Make this the primary thesis of all your teaching, and you will do more than in any other way."

I send you this copied letter with the view of suggesting that you should make this truth, which I have in various places illustrated and am illustrating still more conclusively in a forthcoming volume, the primary thesis of your teachings also in the Brooklyn Ethical Institute. The suppression of international antagonisms is the one reform which will bring all other moral reforms.

XV.

[Huxley delivered his famous Romanes lecture on "Evolution and Ethics" at Oxford in the spring of 1893. It was severely criticised by Spencer, as the following letter will show.—EDITOR.]

TO MR. SKILTON.

June 29th, 1893.

DEAR MR. SKILTON: . . . I am glad to hear that you think of taking up Huxley's "Evolution and Ethics" with a view to dealing with his paradoxical and utterly absurd notions contained in it. Any article or essay on the matter might very properly be entitled "Professor Huxley's Surrender," or "Professor Huxley as a Backslider," for practically his view is a surrender of the general doctrine of evolution in so far as its higher applications are concerned, and is pervaded by the ridiculous assumption that in its application to the organic world it is limited to the struggle for existence among individuals under its ferocious aspects and has nothing to do with the development of social organization or the modifications of the human mind that take place in the course of that organization. I have not the pamphlet by me, having lent it; but the position he takes, that we have to struggle against or correct the cosmic process, involves the assumption that there exists something in us which is not a product of the cosmic process, and is practically a going back to the old theological notions which put man and Nature in antithesis. Any rational comprehensive view of evolution involves that in the course of social evolution the human mind is disciplined into that form which itself puts a check upon that part of the cosmic process which consists in the unqualified struggle for existence.

If my health would allow me I should very much like to take up the matter myself, but I must not entangle myself in more controversies nowadays, and [must] strive to finish a little more of what I have undertaken. I should, however, very much like some one else to take the matter up and publish the reply, not only in America but here.

P. S.—The essential point of the reply might take the form of the question: If that in us which is to oppose and correct the cosmic process is not itself a product of the cosmic process, whence does it come?

XVI.

TO MR. SKILTON.

August 4th, 1892.

DEAR MR. SKILTON: . . . I am not much surprised that your scheme of political propagandism has fallen through. It seemed to me scarcely probable that your system of American politics could be influenced by such high considerations as those which you wished to introduce. Still no harm is done, and possibly some good.

Thank you for the program of the Association's work for the forthcoming season. It seems to me an admirable one. The topics are all well worth treating, and I doubt not will lead to useful discussion.

XVII.

TO MR. SKILTON.

October 14th, 1893.

DEAR MR. SKILTON: This morning's mail has brought me your letter with Huxley's letter inclosed. . . . Truly enough, Huxley says philosophers are curious people—curious enough as illustrated in himself. He implies that I knew that his lecture was in print some weeks before my book was out, tho it was not yet published. Of course, I knew nothing of it until it was published. I should be indeed a "curious" person if I could divine its contents before publication!

XVIII.

TO MR. SKILTON.

February 2d, 1895.

DEAR MR. SKILTON: . . . In one respect you have misread my books, or misunderstood an essential thing contained in them. *You* believe that the course of things in society is to be changed by teaching. *I* do not believe any such thing. Everywhere I have contended, and I contend still, that feelings, not ideas, determine social results,—that everything depends, not upon intellect, but upon character; and character is not to be changed in a day or in a generation.

When I was leaving America in '82 I was unawares interviewed on board the vessel just before we started. The interviewer asked me what I thought of the triumph over the "bosses" which had just been achieved. I expressed my belief that it was only a flash in the pan and that the old state of things would after a time return. It has, as you know, returned. The recent disclosures have shown that the condition of things in New York had again become as bad as it was.

A true theory of social progress is not a *cause* of movement, but is simply oil to the movement—serves simply to remove friction. The force producing the movement is the aggregate of men's instincts and sentiments, and these are not to be changed by a theory.

You think that I have got some message and that utterance of it might stave off impending evils. I have but one message—Be honest; regard the equitable claims of others while maintaining your own. The disregard of all save personal interests is the underlying cause of your present state and of impending disasters. As I said years ago, *à propos* of American affairs, a fatal trait in your society is the admiration for *smart* men, and I believe I said or implied that a people among whom there is an admiration for smart men will come to grief. If you think that a healthier ideal can be established in American society by teaching, I entirely disagree with you. Under your present condition men could not be got to listen. Even if they listened they would not be convinced. And even if they were convinced, their conduct would not be appreciably affected. When men are under the influence of pronounced feelings no amount of reason changes their behavior.

XIX.

FROM MR. SPENCER'S PRIVATE SECRETARY, W. TROUGHTON, TO MR. SKILTON.

June 3d, 1895.

DEAR SIR: Mr. Spencer has asked me to send you a line thanking you for sending him the press extracts in the George matter and to explain why he cannot do as you suggest.

As you know, Mr. Spencer has been for some time past engaged on one of the two remaining divisions of "The Principles of Sociology"—"Professional Institutions"—of which one or two chapters are wanting to complete the part. On looking back at my notes I find that the chapter in hand (the last but one) was commenced over *three months* ago, the delay that has taken place being mainly due to a large crop of small distractions. Consequently he has resolved, in view of the fact that another division remains to be written—one that will absorb all his remaining small energies—that he must set his face absolutely against hindrances of all kinds, and accordingly must decline to say another word about these American affairs. What he wishes to emphasize is this, that if these inroads upon his time and energy by his friends continue to be yielded to, he may fail to complete his work.

P. S.—You may judge of Mr. Spencer's state on learning that his article in reply to Mr. Balfour, which he felt compelled to write, took a month, or less than half a page a day!

XX.

TO DR. JANES.

April 22d, 1898.

DEAR DR. JANES: . . . In the *Monist* for April, on p. 425, you will see that the editor repeats the current theological charge against me of materialism. He has always shown an animus against me, evidently hating, as he does, any philosophy that does not come from Germany. I would avoid myself pointing out how baseless is his tacit assumption, and if you could do it I should feel obliged. You might quote the following passages:

1. Sentences from "First Principles," Sec. 194.

2. Sentences from the "Principles of Psychology," Sec. 63, especially the sentence at the bottom of page 161. Also Sec. 272, especially a paragraph on p. 627. . . .

XXI.

TO DR. JANES, THEN VISITING IN ENGLAND.

August 10th, 1900.

DEAR DR. JANES: At present, as you see, I am away from Brighton; but I expect to be back there by the end of the month, and probably shall be there at the date you name. I shall be glad to shake hands with you and have a few minutes' talk—"a few minutes," I say, because I have been in bed for a week in consequence of having talked too long with a local clergyman. My overworked brain will stand very little, and you see that the results of an imprudence are very serious.

Jeanne D'Arc

BY ALFRED AUSTIN

POET LAUREATE OF ENGLAND

Goddess of battles, with the maiden sword
And blameless banner, when to France availed
Not all her gallant manhood, helmed and mailed,
To drive from off her soil the alien horde
That over pasture, hamlet, vineyard poured,
You with your unarmed innocency scaled
The walls of war, and, where man's might had failed,
Crowning, enthroned the Anointed of the Lord.
And should France yet again be called to scare
The stranger from her gates, and hurl back thence
Feet that would violate her frontiers fair,
Not meretricious sycophants of sense,
But the pure heart and patriotic prayer,
Once more would prove her rescue and defense.

ASHFORD, KENT, ENGLAND.

An Outsider's Experiences with Inside Politics

BY ELTWEED POMEROY, A. M.

[Mr. Pomeroy has been the leading figure in the United States in the fight for the initiative and referendum, and he is now president of the National Direct Legislation League. He is a manufacturer in New Jersey and has introduced profit sharing in his factory. Our readers will remember several articles we have published from his pen, especially the one entitled "How the Trusts Stifle Initiative," wherein he recounted some of his experiences with the Glass Trust.—EDITOR.]

I HAVE repeatedly read wise editorial exhortations declaring that if only the average man would attend primaries and conventions all the evils of the body politic would be remedied. On April 6th last I attended a primary for the first time in my life, and on April 14th I attended my first Democratic convention. My time and effort were misspent and I felt that the only value it had for me was an experience as to what not to do. I will not go again unless I join some organization to raise a row about the way it is being conducted. It is utterly useless for the average man to attend a primary or convention, unless my experiences are exceptional and not the rule.

I cast my first vote for Cleveland on the free trade issue, and only once have I not voted for a Democratic Presidential nominee. I have never been a candidate for office, never desired one. I am only an average business man, living in a nice and quiet neighborhood in East Orange, N. J., a suburb which prides itself as being one of the last places where there could be any political corruption.

When a few weeks ago some neighbors and the Hearst managers wrote asking me to stand as a delegate to the Democratic State convention I remembered the newspaper exhortations, thought it was my duty and said I would accept, but I would not go pledged. I was told in reply I would be the only candidate, and no pledges were exacted.

The primaries were held from 7 to 9 p.m., and I went around about 7.30 with a friend. None of my tickets were out, but I saw that those of a contesting candidate were. We stayed and chatted with the judge, who, in course of the talk, said that his father-in-law was the other candidate and that the machine had put him up. The ballot box was a cigar box, with a hole in the lid. On walking away after voting, I told my friend that I presumed the father-in-law would be the delegate instead of myself, but I returned about 8.30 and watched the box opened and the count made. To my surprise I had the majority of votes. The judge walked homeward with me and we got quite friendly. He said he was sick of the fraud practiced in Essex County, and that he had made up his mind that this election should be fair, nothwithstanding that he had been told to elect my rival even if he had to put ballots in the box, for he could not be punished, as this election did not come under the law. This latter was true. He said he was for Hearst, because he was not the servant of the corporations as Smith (ex-United States Senator James Smith, Jr., the local Democratic boss) was, and that the Democratic party would never win unless it abandoned fraud.

In another district in East Orange no primary was held at the place named and a letter carrier made a search of the district and could not find any, yet a credential was issued. In another, no primary was held at the appointed place, tho after a thorough search one was found being held a few minutes before nine o'clock ten blocks from the proper place, by candlelight, in the rear of a barn. No notice had been given of the change. Two men were there, the judge and his assistant, and the judge was the candidate, and two votes were cast by these two men. This judge was given a credential as a delegate. In the First District of the Third Ward there were twenty names on the ballot book as casting votes and twenty-six votes in the box, and the judge was a man who does not live in East Orange. Such were the primaries in the respectable, high-toned city of East Orange, N. J. The captain boasted to me afterward that I was the only man elected who was not a machine

man. I was only elected, first, because I had made no preliminary canvass and the machine men thought I would be defeated as a matter of course; and, secondly, because the judge was an honest man and disobeyed instructions. The primary election was a farce; indeed, it seems to me nothing worse could have been done in the South or in the city of Philadelphia. I was given a credential, but would not have been given one if it had not been thought that it made no difference in the results, and if I were not a well-known man in my community and it would not do to walk over me too rough-shod. The chairman of the East Orange Democratic Committee receives $150 to $400, perhaps more, at every such election for expenses. He spent at this primary election $150 in one district by his own boast. He divides some of it among the workers, who are rarely men of any standing.

How was it in the rest of the country? In one district in Newark 126 names were on the poll books as voting, but 226 ballots came out of the box. The anti-machine candidate got 86 ballots and no one favorable to him could get near the box. At least the election should have been declared void, but the machine man got the credentials. In another, two men detected the judge in the act of changing the ballots of voters before he put them into the box. When this was proved he was not even reprimanded. In another, the Hearst candidate watched the counting, and he had a clear majority. The next day the credential was given to the anti-Hearst man. Moreover, in some places primaries were not held at all, and primaries were moved and no notice given of the change of place. In Montclair Mr. J. R. Buchanan had been specially obnoxious to the machine. The primary was being held by the regular judges and at the regular place. At 20 minutes to nine a man came with a written note from the county chairman, a man named Nugent, and a nephew of ex-Senator Smith. Thereupon the judges were removed, others were appointed, and the primary was moved to the back of a barber shop ten blocks away. But this primary had been opened an hour and a half previous to the notice. A strong protest was raised at this and the county committee had to throw out both candidates, but before the convention the chairman issued credentials to Mr. Buchanan's opponent, tho the decision of the regular authorities had been that neither should have credentials.

Yet so strong was the Hearst movement that of the 181 delegates from Essex County the machine men had to issue 85 credentials to the Hearst candidates. If there had only been the frauds in the elections and if the county chairman had issued credentials to those who were elected on the face of the returns, the Hearst men would have had from 100 to 110 of the delegates. If there had been fair primaries as well, the Hearst men would have had from 150 to 170 of the delegates.

Two nights after there was a caucus of the delegates. I attended. A lawyer named McDermitt, who was debarred from the New Jersey courts for fraud, was put up as chairman. One of the secretaries was a man who was indicted for ballot box stuffing, but was not convicted.

The first business was the naming of candidates for delegates at large to the St. Louis convention. Some one nominated ex-Senator Smith, who sat blandly smiling in the front row. Many were on their feet to nominate others, demanding recognition from the chair. The chair, however, recognized no one, called for the ayes, did not call for any noes, and declared Mr. Smith the choice of the caucus. It was that way all through. No recognition was given to any but the few men who named the machine candidates. In one case one of the Hearst men did get the floor, but the chairman recognized another man, who moved the previous question, which the chairman put while the man who by rights had the floor was still trying to speak. They directly disobeyed the call for the caucus by taking the votes of both districts—Essex County holds two Congressional districts—on the delegates, which should be chosen by each separately. This was directly contrary to precedent, to right and to the call for the caucus, as each district should choose its own delegates by itself. A point of order was made, but the chairman decided it his way and refused to listen to an appeal. A resolution calling for the unit rule was jammed through, and by this my vote

and those of all the others was delivered as the chairman wished. There was no deliberation, no fairness, no rights, given to the minority, not even that of discussion. Tho entirely unpledged, I went out with the Hearst men. It was the only course left, as there was utterly no use in staying.

I took a day off from business and went to the convention. The railroad tickets of the Hearst men were paid and I accepted a ticket. The expenses and more of the machine men were paid by that side. We know that Hearst furnished the money for his side, because he wanted delegates to the St. Louis convention. The public does not know who furnished the far larger fund on the other side, nor the reasons why it was furnished.

I carefully observed the appearance and character of the two sides. My conclusions were corroborated by those of a country editor with whom I had a talk. The machine men, with the exception of a few shrewd leaders, were roughs and toughs. The Hearst men were a decidedly better class. They were there for a purpose. They were small business men, farmers, merchants, clerks. They more correctly represented the mass of the people in their looks, walk and talk.

The convention began late and almost all the Hearst men who had credentials were admitted to the morning session, which only consisted of the naming of the chairman, a corporation lawyer named Lindabury, who made a speech, and the naming of the committees and the contests. There was no discussion and no action of consequence. Mr. Lindabury is the counsel for the Trolley Trust in New Jersey, and one of the counsel for the Steel Corporation, and of the counsel for the bankrupt Shipbuilding Trust. He has fine manners and appearance, made a specious and eloquent speech, the first part of which was on national issues, denunciatory of the Republican party and Roosevelt, and filled with glittering buncombe. The smaller part was devoted to State issues. The Republican party in New Jersey has controlled the legislature for some years. It has been rotten and corporation ridden. The State is ripe for an overthrow on the question of equal taxation. Then Mr. Lindabury turns to States issues, says a good deal about the Lehigh Valley road and the canal—he is not counsel for the Lehigh Valley road, but may be if he is important enough—and utters a lot of platitudes about taxation, and a few guarded remarks. The convention wildly cheers and afterward crowds upon the platform congratulating the speaker, but really Boss Smith gets more congratulations than Mr. Lindabury. Smith has been the one who really pulled the wires that put Lindabury there. He receives them modestly and turns them off to Lindabury with much tact.

Then the counties are called for their nominations for delegates-at-large and committee members. There are many contests, but these are all referred to the Committee on Credentials. We adjourn.

Of course there was a contesting delegation from Essex County, and they named me on the Platform Committee. I went directly to the room where this committee was to meet. Three or four men were talking there. In a moment ex-Senator Smith strolled in, casually remarking that he had engaged (and presumably paid for) the room we were in and hoped it would be satisfactory and that he would see Gourley (the State chairman), who had suggestions for the platform. We waited a half hour. A third of it passed in casual talking. I made some inquiries. "Oh! the platform was already in type and likely Mr. Gourley would be in with it soon." I suggested that at least the Platform Committee should see it. So we sent out for Mr. G. He was at last found, but had forgotten it. After another twenty minutes we got his platform, which was already in type. No roll was taken. I do not think a man in the room knew my name, but I nominated a chairman and then suggested that we go over the platform, section by section. This we did and practically rewrote it. I sat at the chairman's elbow and suggested. Most of the suggestions were adopted. On one point one old man said: "I don't believe in it, but it will get us votes; put in it." At the end an honest countryman asked for a few minutes on the good roads question. They were going to choke him off, but at my suggestion he was given a hearing. He had come expressly for that purpose. It was a good suggestion, and after some arguing, rather than have any

more talk, they consented to put it in. The chairman, however, did not approve, and when the platform was finally printed that plank was missing.

I came to the conclusion that machine leaders are indifferent to platforms and pay little attention to them. As one man in the committee said: "They are good to get in on." But as machine politics have debauched conventions so that they do not do their proper work, but only register the will of the bosses, so the average platform committee would not do its work; hence, the making of the platform is usually delegated to some one beforehand. Sometimes it is good, sometimes it is not, but whether good or bad it is utterly unimportant to the bosses.

But the real work of the convention was done by the Credentials Committee. The room in which this committee sat was crowded, but the combination of the different local bosses had been arranged beforehand and every possible contesting delegation was thrown out on any excuse at all. The machine had the majority, and tho there were angry words the reporters were not present and the contestants were thrown out, even bodily if necessary.

One county, I think it was Cumberland, had about 32 delegates, and all but three of these, I think, were Hearst men. There had been no contests, the credentials had been issued, the delegates had caucused and chosen their chairman and done their other work. The county chairman had been summoned to Trenton the night before. He had been seen by the bosses, and the next morning there was reported another set of delegates, all but a few of whom had not even been voted on at the primaries. They were seated.

In Camden County 77 out of 90 delegates were favorable to State Committeeman John A. Smith. They had duly signed credentials and were duly organized. But Thompson, of notorious race track and gambling fame, and his gang, many of them from the slums of Philadelphia, were seated in their place.

In the Second Congressional District, by a vote of 102 to 21, the delegation elected Messrs. French and Brown to go to St. Louis, and there was no contest over it. But two other men, whose names had never been heard of and who were never voted on, were reported to the convention and named by it.

These are samples of the work of the Credentials Committee. When we went to the hall for the afternoon session Nugent, the Essex County chairman, and nephew of Boss Smith, stood at the door with a number of roughs. He himself had signed 85 of the 181 Essex County credentials to the Hearst men, and there was, therefore, no contest over them. When these credentials were presented at the door for admittance he tore them up in the faces of the men owning them and sent in others. I do not know whether other county chairmen did likewise, but this was done to the Essex County men. Mr. J. R. Buchanan, of Montclair, who has spoken in all the recent political campaigns for the Democratic party, had a platform ticket to the hall. As he was crossing to speak to some one three of the roughs set upon him, seized him by the coat collar and dragged him backward out of the hall. He was not talking aloud and was guilty of no impropriety.

I managed to get into the hall. I tried to get recognition and saw others try to get it from the chairman, but he recognized none but those agreed on beforehand. During the noon hour I had heard Mr. Lindabury speak feelingly that the best way to treat a convention was with perfect fairness all around. He was not fair in the convention, but then he could not have been chairman unless the boss had felt sure that he would be a willing tool.

Yes, there was harmony in the convention. It was the harmony of the lamb and the lion, with the lamb inside of the lion. I am confident that had those who held *bona fide* credentials been seated, the Hearst men would have had a large working majority, and if there had been fair primaries as well as a fair Credentials Committee, the Hearst men would have had not less than three-fourths majority. The convention would not have gone as smoothly, but it would have taken some real action instead of simply registering the will of the bosses and affording a day's excitement and oratorical amusement to about a thousand men.

One curious affair illustrates how the convention was worked. Davis, the

Hudson County boss, wanted to have the delegation instructed for Parker. Smith, who is the Essex County boss, and really the State Boss, with a big B, wanted an uninstructed delegation. More influence can be wielded at St. Louis by the State Boss. At the psychological moment Judge Noonan, of Jersey City, got recognition from the chair and made a nice little speech leading up to such a resolution. He had gotten half through reading the resolution, when the other side saw the gist of it. As once Smith was on his feet and half a dozen others. While Judge Noonan still had the floor and was on his feet, Lindabury, at a nod from Smith, recognized another man, who moved to adjourn, and he declared it passed. Smith was unwilling to have the convention even consider such a resolution and shut it off. The Jersey City men laughed as they recognized they had been beaten on a minor point by the same methods they usually used themselves. That laughter told me the whole story of the utter degeneracy of the parliamentary system in such hands.

What are the means used by the bosses? Five. First, Corrupted judges at the primaries and bulldozing tactics there. Second, A browbeating county and delegation chairman, with his attendant thugs. Third, A properly managed Credentials Committee with the proper arrangements made beforehand so that there will be contests, and the contests decided their way. Fourth, A tactful chairman, who will have fine presence, be a hypocrite and pretend to fairness, but never recognize any but machine men. And, fifth, the presence of the boss, with his ever-ready check-book and his fine knowledge of men to know what he must do to win his way with them.

EAST ORANGE, N. J.

Reminiscences of Edgar A. Poe

BY MRS. SUSAN ARCHER WEISS

WITH AN INTRODUCTION BY JAMES A. HARRISON, L.H.D., LL.D.

[It was a series of three articles, published in THE INDEPENDENT in September, 1900, written by Professor Harrison, of the chair of Romance Languages in the University of Virginia, entitled "New Glimpses of Poe," that was the occasion of the publication of the great "Virginia edition" of the Life and Works of Poe in seventeen volumes, edited by Professor Harrison, who is now recognized as the chief authority on all matters relating to the most distinguished and most unfortunate of American poets. Certain important material as to Poe's life that reached Professor Harrison too late to incorporate in those volumes he has embodied in this and one or two succeeding articles. Mrs. Weiss was known in literary circles under her maiden name of Talley, and published a volume of musical verse in 1859.—EDITOR.]

The editor of the following pages offers no apology for presenting to admirers of Edgar Allan Poe a number of interesting unpublished reminiscences of the poet by contemporaries, and letters and documents about him from a throng of correspondents who were deeply, even passionately, concerned in him and in his career at the time of his death. The recent Poe revival adds further keenness to the relish with which everything connected with the poet even in a remote degree is seized upon and read. New portraits of the poet are eagerly scanned to see if they chance to unlock the mystery of this musical and mysterious being; the places where Poe lived and labored—old Richmond and Philadelphia and New York houses, old printing houses like the *Southern Literary Messenger* office (still standing in Richmond), where he superintended his publications and read proofs; old taverns where he "put up" under the olden *régime*, like the Swan Tavern and the old United States Hotel (also still standing in the Virginia capital); the quaint house, 2613 East Grace street, Richmond, where he wooed and won Mrs. Shelton; the home of the Mackenzies, "Duncan's Lodge," where his sister Rosalie lived and he so often lodged in the hospitable forties; the curious little fortress-like cell which he inhabited at the University of Virginia: the Philadelphia homes; Fordham; the home of the Whitmans in Providence—all these places are visited with almost reverential interest by Poe pilgrims from far and wide and invested with a delicate glamour of admiration emanating from the enduring and apparently inexhaustible force of the Poe legend.

Only the other day the writer held in his hand the locket that encircled the most precious of all the Poe portraits: the medallion of 1836, containing the exquisite miniature painted in oils on ivory, probably by a Madame Guillet, of New York, then living in Richmand. From this fragile disk seemed to flow all the passion and the poetry with which the young man of twenty-seven was surcharged, superadded to the deep pathos of the fact that this was the very locket-portrait that hung about Virginia's neck when her beautiful, troubled spirit passed away at Fordham that bitter January day in 1847. The owner generously removed the rare relic from its case, showing the ivory background of the picture and calling attention to the clear gray eyes and pallid complexion, rich,

nevertheless, with the underflush of red blood that coursed imperiously through the veins.

In another interesting drawing-room to which the writer had access hung in a charming oval Sully's lovely portrait of the first Mrs. Allan, the foster-mother to whom Poe was tenderly attached, beautiful enough to have inspired his "Helen;" around the corner, in another stately room, was a delicately chiseled bust of the second Mrs. Allan (whom Poe as heartily hated), a handsome, noble-looking woman into whose massive face a Neapolitan sculptor had thrown Roman energy and severity combined: twin types of the Virginian women of two generations and a half ago. In the iron safe of a third Poe *connoisseur* lay a yellowed bundle of priceless Poe letters covering the dark period from 1826 to 1834 and jealously guarding the secrets of his university career, his years in the army, and his West Point escapade. Down the street, behind a historic church, was the house once illumined by the presence of the Psyche "Helen" herself.

The poetical haze that hung about all these things and glorified them in the eyes of the pilgrim could not be mistaken: Poe was still very much alive!

It has therefore seemed not amiss to gather up further memorials of this singular genius and present them here, furnished with such brief running commentary as may serve to make them intelligible to the general reader.

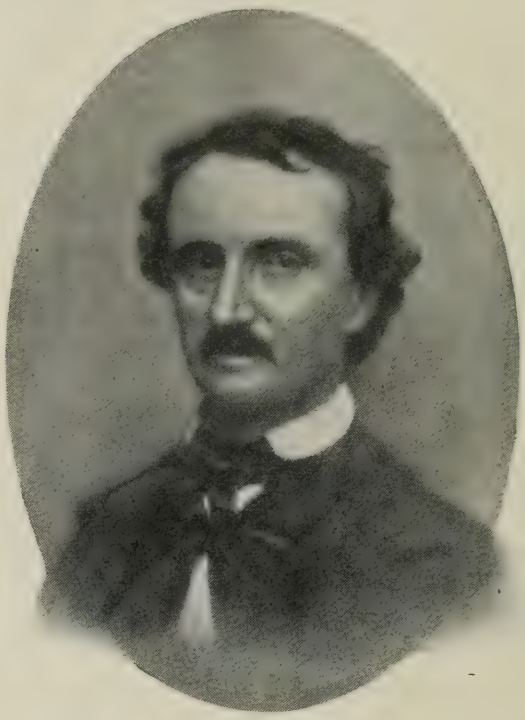
In the present paper I include reminiscences from the pen of the venerable Mrs. S. A. Weiss, with whose "Last Days of Edgar Allan Poe," published in the old *Scribner's* for 1878, readers of this magazine are probably familiar. Mrs. Weiss is still living, at an advanced age, in full possession of her remarkable faculties.—J. A. H.

Mrs. Susan Archer Weiss to Professor Harrison:

6 North Park Street, Richmond, Va.,
December 9th, 1901.

Dear Sir:

I regret not having heard from you at an earlier period of your work on Poe, as I might then have supplied you with items, of no great interest in themselves, but serving to truthfully illustrate his character, surroundings, etc., as a schoolboy. It is now, I suppose, too late for this; but I may mention one or two things in which I am convinced that Poe has been done great injustice, and from which I am anxious to see him cleared. One of these is in regard to his rupture with Mr. Allan, at that time an old man in failing health and completely under the influence of his second wife, much younger than himself and to whom he had been but recently married. Mrs. Julia Mayo Cabell, who was first cousin to this lady, and Miss Anne Valentine, sister of the first Mrs. A., and who continued an inmate of Mr. Allan's house until his death, always declared that Edgar was "blameless" in this matter. On returning home from the university* he found his position in Mr. Allan's family entirely changed, under the *régime* of the new wife. The servants were forbidden to obey or attend upon him, as formerly, and a room was allotted him which was used by the first Mrs. Allan's maid and which he refused to occupy. In an interview with Mrs. A. she reminded him of his dependent position as an object of "charity" in her house, which so incensed him that he accused her of having "married for money," etc. In reporting this to her husband she declared that "she and Edgar Poe could not live under the same roof." Mr. A. at once, in his impulsive anger, ordered him to leave the house, which he immediately did, refusing (so said report) the money offered for his immediate expenses. Mr. and Mrs. Allan's friends and relatives and also his *enemies* placed the worst construction upon the affair, as regarded Poe; but there were others who warmly defended him and remained his friends through life. I tell you all this in confidence, as I have heard it from some of our best citizens, who knew all the parties concerned, because I wish you to understand how much wronged Poe was. The matter was much discussed in Richmond at the time, and all sorts of reports got abroad as to "unpardonable ingratitude" to Mr. Allan and "outrageous insult" to his wife. This culminated in Dr. Griswold's account of the matter, *after Poe's death.*



I once ventured, when a girl, to inquire of Mrs. Allan in regard to Poe's personal appearance. She replied, with the suave and dignified politeness of which, as a thorough woman of the world, she was mistress: "My dear Miss Talley, I never *but once* saw the person of whom you speak."

I have but recently been informed by Dr. John F. Carter,* who was an intimate friend of the Mackenzie family, that Edgar Poe was never "adopted" by the Allans, neither his sister Rosalie by Mrs. Mackenzie. This he had on the authority of Mrs. Mackenzie herself and other persons intimate with the Allans. The children were simply taken to be cared for until claimed by their relatives, who, already having charge of Henry, were unwilling to assume the responsibility of the two others. They even suggested an orphan asylum, on which Mrs. Macken-

* Mrs. Weiss is here mistaken. Poe returned to Richmond from the university in December, 1826; "the first Mrs. Allan" lived until 1828.—J. A. H.

* The gentleman (still living) with whom Poe spent a part of his last night in Richmond.—J. A. H.

zie decided to allow Rose (two years old) to remain in her family, and Mrs. Allan, who had become attached to Edgar, persuaded her husband to do the same by him. So it appears that Poe never had any legal claim upon his benefactor as either ward or adopted son, and that his residence beneath Mr. Allan's roof depended simply on the pleasure of the latter. I had it from an uncle of my own, Mr. Edward Valentine, who was also a cousin of the first Mrs. Allan, that Mr. Allan never had any intention of making Edgar his heir, but to educate and establish him in some business or profession which would render him independent. You will observe that this account—the truth of which cannot be questioned, coming as it does from such authority—differs materially from that of Poe's biographers, who represent him as the "pampered adopted son and heir" of Mr. Allan.

EDGAR ALLAN POE

The John R. Thompson crayon, owned by Mr. Charles Quarles, of Philadelphia, to whom it was given by his uncle, John R. Thompson. Unpublished. By permission of the owner.

Another mistake into which these biographers (none of whom knew Poe personally) have fallen is that of representing him as of a gloomy, morose and melancholy disposition, appropriate to the author of "The Raven" and "Lenore." From all that I have heard of him from those who knew him from his babyhood the reverse was the truth. As a child, unusually bright, merry and joyous, he was the delight of all who saw him; while I have been told by Mr. John Mackenzie, Poe's most intimate friend, as also by Mr. Robert Sully and others, that in every kind of schoolboy frolic and mischief, including "playing ghost" and robbing apple orchards, Edgar was the leader and the one who most thoroughly enjoyed the fun. Even in after years and under the most adverse circumstances he was not easily depressed; and Mrs. Clemm is my authority for the statement that when at home, in even the dark season at Fordham, he was invariably cheerful and good-natured. Mrs. Osgood gives a pleasant instance of this in her account of a visit to his wife. But it pleases the public to imagine the poet of a character in sympathy with his writings, a mystical and melancholy recluse and haunter of graveyards and lonely tarns and

"The ghoul-haunted regions of Weir,"

while forever mourning some lost Lenore or Eulalie or Annabel Lee. That this latter poem was in memory of his wife seems a fixed belief in the minds of the public, whereas, by Mr. Poe's own admission to me, it was written some years before her death, and, like most of his poems, lay on his desk for years unfinished and subject to frequent revisions before being published.

One of Mr. Poe's favorite poems (and that which strikes me as being, on the whole, the best) are the lines "To Helen." Once, upon my shyly declining to show him some verses which I had written "when a child," he repeated: "When a child? Then, perhaps they may be your best. Some lines which I wrote at ten years of age I consider as among my best,—commencing

'Helen, thy beauty is to me.'"

But most probably this poem, like the rest, was subject to many revisions and corrections before its publication in his maturer years; for I can imagine nothing more graceful, more exquisite in language, expression and rhythm than this little gem, seeming to breathe the very spirit

"Of the glory that was Greece,
Of the grandeur that was Rome."

Mr. Poe seems to have been incapable of writing poetry with any sustained effort. Impulsive, erratic, he would soon weary of the task and lay aside the sketchy outlines of his poem, to be filled up, touched and retouched until it had reached the state of perfection which his fastidious taste demanded. I was told by Colonel Du Solle—whom I knew about 1869 as assistant editor of the *New York* (Noah's) *Sunday Times*—that at one time he had known Poe well in Philadelphia, where the latter had often come to his (Du Solle's) room in the evenings and consulted him and others present about the composition of "The Raven," which he was at that time engaged in "revising" with a view to a speedy publication. He would read certain stanzas with which he was dissatisfied, explain his difficulties, and ask their opinion and suggestions as to more suitable words or harmonious rhythm, and he had more than once remarked that he had never found so much difficulty with a poem and felt inclined to give up the whole thing and throw away the manuscript. "It was not until years after this," said Colonel Du Solle; "that 'The Raven' appeared in print."

It is certain that Poe was a most indefatigable and elaborate worker upon his poems, and that he never abandoned one until convinced of its utter hopelessness.

I have no letters of Mr. Poe, only a few little notes of no special interest, sent me during his illness at Mrs. Mackenzie's—thanks for flowers, or inclosing a newspaper clipping which had interested him. The first note which I ever received from him was some time previous to his last visit to Richmond, and is as follows:

"If Miss Talley will, upon reading the enclosed letter, seal it and forward it to its address with a word from herself in behalf of the writer, she will confer the greatest of favors upon one who most profoundly respects and admires her genius, tho he cannot as yet boast of her personal acquaintance."

Tho greatly surprised and rather overcome by this flattering appeal, I made no mention of it to any one, but promptly forwarded the accompanying letter, as desired, to my uncle, Mr. Edward Valentine, with whom Poe had in his boyhood been a great favorite.* It was an eloquent and, to my idea, touching appeal for pecuniary assistance in establishing *The Iris* [*Stylus*], and I believe resulted, as such requests generally did, in a promise to contribute to the desired sum should there be a prospect of raising the whole, a consummation of which Mr. Poe was confident up to the time of his death. Mrs. Julia Mayo Cabell and Mrs. Mackenzie had been the first to promise such assistance.

EDGAR ALLAN POE

The Traylor Portrait: from a daguerreotype given by Poe to Mrs. Shelton on his last visit to Richmond, just before his departure and death in Baltimore, October 7th, 1849. The daguerreotype was accidentally injured by chemicals in the effort to bring out the features more clearly. Never before printed in this form. By permission of Mr. R. E. Traylor, Richmond, Va.

The letter to Mr. Valentine above mentioned is now in possession of my cousin, Rev. E. Valentine Jones, of Cismont, Albemarle County, who may be willing to submit it to you should you desire it. I mention the whole matter simply as a proof of the earnestness with which Poe desired and worked for the accomplishment of this desire of his lifetime, the establishment of his own magazine.

* This letter has been printed by the editor in Vol. XVII of his edition.—J. A. H.

I have written the foregoing under many difficulties, chief of which is the occasional inability *to hold a pen*,—so that I can write but at intervals and in the discursive and disjointed style of the present MS. However, I send it to you as it is, regretting that I have nothing of more interest to offer.

Should you desire to make any special inquiry concerning Mr. Poe, I shall take pleasure in answering it to the best of my ability.

Begging that you will make all allowances for this unsightly MS., and wishing you a happy Christmas and New Year,

I am very truly yours,
SUSAN ARCHER WEISS.

Japanese Soldiers

BY MARGUERITE GLOVER

[Miss Glover has recently returned from Japan, where she spent seven months in traveling all over the islands. The following article on the Japanese soldiers gives a very interesting glimpse of their character.—EDITOR.]

MY first contact with Japanese soldiers might have been a trying one, but it proved quite the contrary and inspired me with a respect for them that I shall never lose. It was in July of last summer, and Russia even then had assumed such an intolerable attitude in her dealings with Japan that the Minister of War, feeling no reliance could be placed upon her oft repeated promises of the evacuation of Manchuria and that the only solution of the problem was war, determined to put the troops in readiness for immediate action.

Large forces of soldiers were brought from the different posts in the northern part of the main island, Honshu, and also of Yezo, and were transported by railroad south to Moji, where they boarded transports and were shipped to the opposite side of the island, to Nagasaki and to Formosa.

The rainy season was at its hight and railroad travel in all directions was more or less demoralized by washouts and flooded tracks. At Kyoto we were told the regular trains were all late, as right of way had to be given to special trains filled with soldiers coming from the north. As a consequence our train was an hour behind time on reaching Kobe, so we lost connections with the southbound train to Hiroshima.

I was traveling by myself, and as no railroad official could tell me whether my train would pull out in five minutes or in fifty, I concluded it wiser to remain standing on the platform ready to take my seat at a moment's notice than to go and sit comfortably in the station.

As I stood alone on the long platform the special train came in and stopped beside it. On board were between six and seven hundred infantry, cavalry and officers, and to at least half of these men the sight of a young foreign woman in European costume was of more interest than would be a Choctaw squaw in full Indian dress on lower Broadway.

My stay in Japan had been long enough for me to realize this fact, but there was nothing for me to do but stand and endure what I supposed would be facetious and far from kindly criticism and brutal stares. At the order of the captains the different companies stepped out from the cars, which were crowded to their utmost limit, formed in line, saluted their commanding officer and then stood at rest with their muskets placed upon the platform. One glance at the long line of men filled me with such admiration and amazement that I entirely forgot my embarrassment and self-consciousness. Such fine specimens of humanity I had never seen in enlisted men in any country in Europe, Asia or America. Far from being undersized, as

I had always pictured Japanese soldiers, they were fully as tall and large as the English soldiers and larger than the French. Such clean, healthy, ruddy skins, with none of the signs of drink one so often sees in the European troops; such bright eyes, good teeth and muscular, well developed bodies.

It was a revelation to me and I stood and stared with surprise. But the looks they gave me and the remarks they made were totally different from what I had expected.

To them I was an "honorable foreigner," curious in shape, with skin of such whiteness as to excite their unbounded admiration; my hair, being blond and curly, appeared to them like beast's hair, and for that deformity they pitied me, as they also pitied me that I should have deformed feet, which inference they drew from my wearing high heels to my shoes. Not one unkind, vulgar, low or insinuating remark did they make, nor as they looked at me with the keenest of interest was one glance unpleasant or even suggestive. The captains giving the word, the men broke rank and two by two marched to the bridge, over it and on to the platform beyond, for railroad stations in Japan are arranged as they are in Europe, and no one is allowed to walk across the tracks. A soldier in Japan, be he high or low rank, has the respect of his countrymen, for the sword bearer and warrior has been an honorable profession and that of a gentleman for over two thousand years. The body of men as I saw them were equipped for a journey that might last indefinitely, so they carried their knapsacks, with their gray army blankets in a neat roll tied around them. Each man had an extra new pair of strong shoes of very heavy leather made after the pattern one sometimes sees in the country, a little higher than low shoes but not so high as boots. These shoes, soles outward, were tucked through the knapsack strap on either side over the blanket, and at a distance the light brown soles shone out like huge ornamental buttons. The knapsacks were far less smart than those our men carry, but looked very durable. They were made of some kind of leather, possibly horsehide, with the hair left on, and so would shed the water well, which is an important factor to be considered in a country of such heavy rains.

The clothes of the men were neat, but were much simpler cut and made and appeared far stronger than those our soldiers wear. The cloth seemed better quality and heavier than what we use, and one would suppose it could stand much harder service. Tidy, light brown leggings made of goods like khaki and the usual soldier's cap on their heads completed the outfit of wearing apparel; but two other objects struck my eye and gave me food for thought. These were the water flasks and the receptacle for the day's rations. The first was nothing more than one would expect, but the second, to my amazement, was a small wicker basket about nine inches long by four and a half wide and two and a half high; the cover fitting down over the top like one of those old-fashioned telescope bags. In this basket the men carried enough cooked rice for one meal or enough of the uncooked grain to last them all day when on a long march.

It was past noon and the men were to be given their midday meal; so just the distance of two narrow gauge tracks away I watched these hundreds of soldiers fortify themselves after probably six hours of fasting and continuous travel. Each flask was removed from its socket, the empty baskets opened, and chopsticks were brought out from inside small wooden cases. Men, carrying huge covered tubs as big as half a barrel and made of fresh, white wood, came down the platform, two men to each tub. In the tubs was steaming snowy rice, cooked so each grain was separate, and every soldier had his basket filled full of rice. A small piece of dried fish half the size of an ordinary herring was given him and several slices of the radish pickle called *daikon,* without which no Japanese feels his dish of rice is complete, and these three articles of food made for him a meal that was above criticism. Tea kettles of brown pottery larger than any I had ever in my life seen were brought and each man's flask was filled, and he was given as much tea as he cared to drink. The Japanese practically never drink fresh water, but their tea takes its place. This is made from water that has been boiled (a necessary precaution in a coun-

try where all the drainage is surface), and it is made weak so a quantity may be drunk with no bad effect to the nerves. In no time the dinner was finished, for the Japanese all bolt their food; so the flasks were slipped back in their sockets and the baskets strapped to their belts. But again a surprise awaited me. On the platform everything was as neat and clean as it had been before the food was served; no dirty pieces of paper, no crusts of bread, none of the *débris* that always remains after foreign troops are fed, was to be seen, for the simple reason that there was no scrap or morsel of food left to litter up. It is an unwritten law that rice is too precious to be wasted, and every grain is religiously eaten, and no more fish, pickle or tea would be taken than a man cared to eat. Before boarding the train again each soldier took from his pocket his tiny pipe, that appears so miniature and toylike to us, filled it with the tiny ball of tobacco cut so fine as to be almost like horsehair, and took the three puffs that is all the tobacco will yield. The smoke being through, the pipe was returned to its case in the pocket, and the men, well satisfied with their repast, are prepared to endure another six or eight hours of march or of railroad travel. The secret of the Japanese success in the war with China and of their superiority to all the other allied troops at the time of the Boxer uprising was not far to find.

Men who took pride in their profession of arms as did these soldiers, for each one individually feels a personal loyalty to and affection for the Mikado and that he himself is fighting for the honor of the Emperor and his Empire, and who can not only endure but thrive on a day's rations of a handful of rice, are serious antagonists for any European nation to meet. All the soldiers were sober, quiet, orderly, as tho they felt the dignity of the nation they represented and the responsibility of the task to be undertaken. Could this ever be said of our troops?

LAKEWOOD, N. J.

Germany in Southern Brazil

BY GEORGE AGNEW CHAMBERLAIN

[The following is the first comprehensive article, as far as we know, that has appeared in America in regard to the German colonists in South America and their much apprehended future relations to the Monroe Doctrine. The article is written by a man on the spot who knows whereof he speaks.—EDITOR.]

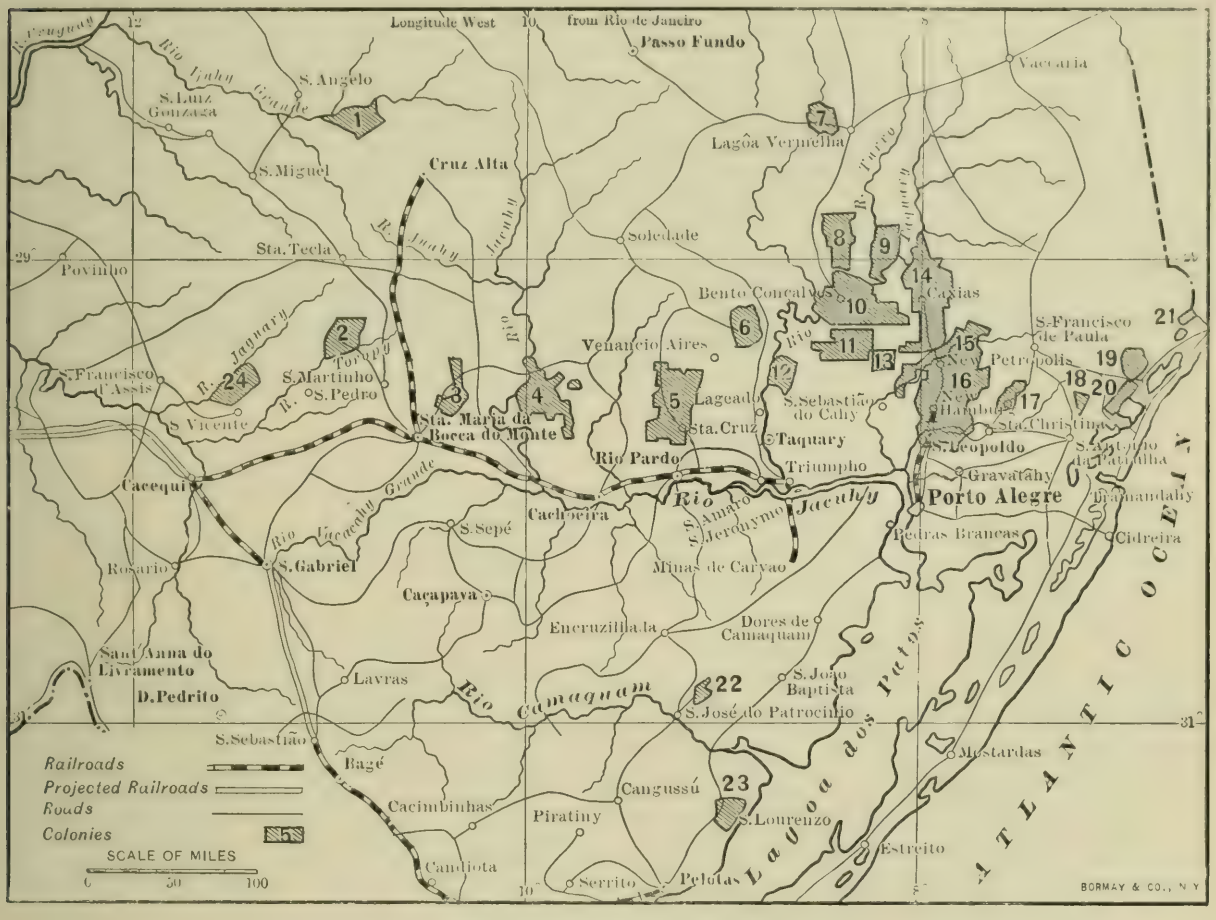
THE reader of current international news and conjecture has come across the phrase "German supremacy in Southern Brazil" so often that it must carry with it a vague conviction that there is some potent stuffing in the scarecrow. But he will be at a loss to justify this conviction by any adequate information as to the conditions from which the phrase draws its significance.

During a recent visit to the United States the writer was struck by the non-information of informed persons in regard to all things South American, especially Brazilian, and it is the object of this paper to supply the vital facts respecting a pregnant feature of colonization in the vast Republic of Brazil.

To begin with, it should be realized that Brazil is as supreme south of the Isthmus as is the United States north of it, and that it controls a territory almost as large, occupied by a population estimated at eighteen millions.

Its German element is practically limited to the four southernmost maritime states—namely, Rio Grande do Sul, Santa Catharina, Paraná and Sao Paulo, which together have an area approximately equal to that of Florida, Georgia, Alabama, South Carolina, North Carolina, Virginia, West Virginia and Tennessee,—and has also taken deep root in the small State of Espirito Santo.

German invasion has been of two kinds, mercantile and colonial, the latter having attained large proportions only in



the States of Rio Grande do Sul and Santa Catharina.

This arbitrary use of the terms mercantile and colonial should be clearly defined. By the mercantile invader is here meant that omnipresent German one finds pioneering for business in every new field of commerce. His number is legion but is scattered all over the world, and is no more prominent in Brazil than in any other South American country. This class goes out for business, is in a measure transient and is tenacious of its relations with the Vaterland. But its most significant characteristic is the logical tendency to scatter rather than cohere. Its case is one where community of interests does not lie in proximity, and consequently it is a floating body of antagonistic units which can have no great weight as a social menace.

The colonial invader is a term used here to define the German who is making for himself a second home, who in many cases devotes his energies to business, but for the most part undertakes the tilling of land on a scale adapted to his means or turns his attention to manufacture in general.

This is the element whose steady expansion in Southern Brazil has drawn the eyes of the world, and the justification of this article lies in putting before the reader the facts obtainable in regard to its origin and subsequent development.

Study will be in the main restricted to the States of Rio Grande do Sul and Santa Catharina, as being a representative region and that most thickly settled by Germans, corresponding in area and position to the territory embraced by Florida, Georgia and part of South Carolina.

Map of Rio Grande do Sul

Of these two States Rio Grande do Sul is by far the larger. Its first German colony, S. Leopoldo, was founded in 1825 under Dom Pedro I. A year later came the foundation of the colony of Torres, and in 1827 that of Forquilhas. Then came the so-called Sansculotte revolt (1835-1844) in Southern Brazil, during Garibaldi's virgin campaign, and which for a time stopped immigration.

Not until 1848 was its flow reanimated, but it then found a fresh and powerful impetus in the troubles following the revolt of the German duchies against Denmark, and a flood of immigrants entered Brazil, from Sao Paulo to the south, coming by families from Schleswig-Holstein and parts of Germany affected by the general European turmoil of that year. A coincident and far greater immigration to the United States during this period will be remembered.

Rio Grande do Sul was then a province of the Brazilian Empire, and Government lands were ceded in lots of 174 acres to each settler. But about 1850 speculative abuses became rife and in 1854 these free grants were stopped. The lots were reduced to 116 acres each and the takers were charged a reasonable price, according to the location and natural advantages of the land, and were allowed six years to make payment.

The impetus taken in 1848 was of lasting duration and gave rise to the colonies of Santa Cruz (1849), Mundo Novo (1850), Conventos (1853), Mariante, Silva and Estrella (1854), Maratá (1856), S. Angelo and Santa Maria da Soledade (1857), Nova Petropolis and S. Lourenco (1858), Rio Pardense (1859), and Monte Alverne and Teutonia (1860).

This flow received a great check in the imperial rescript of November 3d, 1859, which forbade German emigration to Brazil, an edict which was not officially repealed until 1896. Another natural discouragement arose in the Brazilian war with Paraguay (1865-1870). But on conclusion of peace the Brazilian Government turned its attention to resuscitating immigration, and, attracted by free passage, many Germans migrated clandestinely through Antwerp. However, the same attraction drew many Italians, and the colonies founded were mixed, but with a preponderance of the German element. Among these colonies were the following: Triumpho (1888), Jaguary and Villa Nova (1889), Guarany and Ijuhy (1890) and Marques do Herval (1891).

In the cities the Germans have also taken a strong hold and have almost absorbed commercial and industrial enterprise.

Porto Alegre, the capital of the State, is predominantly German and "German spirit and customs" (*Deutschtum*) find a constant exponent and incentive in three strong publications: the *Deutsche*

Port of Rio Grande

Port of St. Catharina

Zeitung, Das Volksblatt and the *Koseritz Deutsche Zeitung*. Other papers published in the State are *Die Post, Kolonie, Pionier* and *Der Bote von S. Lourenco.*

The accompanying map shows colonies founded previous to 1898. Since then German territory has spread rapidly and some large purchases have been made by German syndicates.

As to exact statistics, it is impossible to give in figures the racial proportion in the State, as the last census (1890), aside from its recognized inaccuracy, is too remote to serve as a basis. However, two recent estimates give the German-speaking population respectively as 160,000 and 240,000; the first made by a German, the second by a Brazilian.

In Santa Catharina, the next State north, conditions are almost analogous. German customs and idiom prevail and in many of its towns one can imagine one's self in a little Germany. The element some years ago was strong enough to elect a German Governor, and, excepting the official representatives of the Federal Court, office-holders are almost all German, and the anomaly of Brazilian Government reports written in German is not unusual.

German colonization in this State owes much to the fact that it was for some time the residence of the Prince de Joinville of Saxe-Coburg-Gotha, who married the daughter of Brazil's first Emperor. The city of Joinville, German to the core, is to-day a monument to the Prince de Joinville's endeavors, cordially assisted by the Emperor, to form a nucleus for German immigration.

The Metropolitan and Hanseatic immigration and colonizing companies have carried on extensive operations within this State, which have created much comment; and a recent report affirms that such a syndicate has acquired a concession of 2,138 square miles, which, added to the lands already obtained in Southeastern Brazil in this manner by Germans, gives a sum total of 11,534 square miles, a territory equal to that of Alsace-Lorraine and the Kingdom of Saxony together.

The report goes on to say that the syndicate intends to divide the tract into 17,000 lots and construct a railway ninety-five miles long connecting it with another colony already established; that its object is to deflect the current of German immigration now running to the United States; and that its colonists shall retain their German nationality.

General conditions in the two States are the same; and altho there are thousands of colonists of Italian, Polish and Russian origin scattered through their territory, it is the Teuton that has put his stamp on the region as a whole.

A Brazilian told the writer of having walked the streets of a large town in Santa Catharina for hours before he could find any one who knew enough Portuguese to direct him. Such towns are not isolated, but so common that they hardly cause remark.

It is this feature of non-assimilation that gave rise in Brazil to the cry of the "German danger." Americans who are familiar with the rapid amalgamation Germans undergo in the United States will appreciate the significance of this phenomenon. Its explanation to a certain extent lies, no doubt, in racial incompatibility, but there are other causes, one of which can be deduced from the following quotation from Mr. Königswald's book on Rio Grande do Sul. He says:

"These colonies have built a State within a State. Of German customs very little has been lost, also the German dialect, with its native idiom, is handed down from generation to generation. Portuguese is little spoken and even the German born here uses it with great difficulty. These honest colonists are good Brazilians; however, they neither disown nor forget their mother country."

This might be followed by a quotation from a Brazilian diatribe on the "German danger":

"To appreciate the intelligent stealth applied to the work of undermining, it is enough to mention the annual contribution of the German Government, amounting to 600,000 marks, expended on public instruction in Southern Brazil, of which German papers of the highest standing speak without the least attempt to dissemble."

These subsidized school teachers are in almost all cases the German pastors of the different districts, and this strong moral and intellectual link between the home government and the immigrated colonists seems to the writer an important factor in the propensities of the Teuto-Brazilians for retaining racial distinction.

In Sao Paulo, the wealthiest and most powerful State in Brazil, the German element is almost exclusively confined to the capital, which takes its name from the State. This city's population is estimated at 170,000, and of this sum 10,000 are German. However, this group can be relegated, almost as a whole, to that element which has been termed the mercantile. Here this element is found in its most advanced form, for it has attained commercial supremacy, and throughout the State has become the synonym of capital. Through its hands passes half the world's supply of coffee, and its imports to Brazil are out of all proportion to those of any other equal group.

Too recently to obtain absolute confirmation, the writer has been informed through a gentleman officially connected with the Commercial Exchange of Sao Paulo that during the Transvaal war a German firm prominent in this group received a loan from the German Government of 2,000,000 marks, free of interest, to be employed in mortgages. The same firm recently made a large loan to the State of Rio de Janeiro on condition that all the fiscal returns of Rio de Janeiro and Nictheroy be paid over to the loanee daily at five o'clock.

The situation in general is regarded in Brazil from two distinct points of view: That of those who see danger in the ambition of Germany; and that of those who, looking deeper, find cause for alarm in the circumstantial, relative and topographical position of the Teutonic element.

Supporters of the first justify their alarm by such frank expression of German opinion as Dr. A. de Toledo Piza, chief of the Bureau of Statistics in Sao Paulo, quotes in an interesting article on the "German danger." The German professor, Herr Schmoller, writes:

"For more than one reason South America is the land of the future, and we should desire that by every means the South of Brazil, a region capable of sustaining from twenty to thirty millions, and which has not the tenth part, should receive German immigration, whether the region continue a part of Brazil, become an independent State, or come into closer relation with our Empire."

The last phrase, coupled with more violent extracts from the writings of advocates of force who would have the Monroe Doctrine ridden over roughshod, is what especially draws Dr. Piza's fire, and there is a large contingent of

Brazilians which takes its cue in determining German motives from such passages.

In refutation of this point of view, which looks upon the German Government as the predominant menace, Count Von Bülow conceded to a Brazilian press correspondent an interview in which he said:

"I think that the precise declarations which I made in regard to this question in the Reichstag on March 19, and the firmness with which I stated that the reports scattered were calumnious, should be taken as an official denial. In South America, where there is such a high comprehension of parliamentary system, this unequivocal and public declaration made in the midst of the representatives of the German people should justly be received as a solemn manifestation. I take pleasure in affirming that in this declaration my principal aim was to make patent in South America the friendly character of our intentions, and I do not hesitate to tell you again that all fear that Germany intends to annex any territory in South America lacks foundation."

When the correspondent remarked that in America it was feared that Germany, through the development of emigration to Brazil and the endeavor to conserve national sentiment and the German language among the colonists of Southern Brazil, hoped to create, as it were, a State within a State, the Chancellor replied:

"Here captious falsehood is interwoven with truth; it is untrue that we stimulate emigration to Brazil. . . . However, large German colonies have for years existed in Brazil, created in other times, not by us, but through the diligent effort of the Brazilian Government. And it is only in virtue of the physical law of attraction that relations or friends of the colonists, who by their work have attained a certain well-being, turn their steps that way. The same is true on a far greater scale in relation to emigration to the United States.

"In Brazil, also, we wish to form no State within a State, and hope that the Germans there will become useful members of their new country. This was the doctrine preached by the brother of the German Emepror to the Germans of the United States, and holds good for Germans all over the world. Nevertheless, it is just, and this corresponds to our wishes, that the Germans in Brazil, as everywhere, should not forget their mother tongue, nor lose their affection for the land of their birth. . . .

The German Club, Sao Paulo

These are our ideas and I believe that they contain no danger to any South American State. We have absolutely no political aspirations in the New World; we wish, however, economically and as a State having in view the strong development of its industries, to take as great a part as possible in the commercial struggle in South America."

Considering actual conditions, this declaration is apt to suggest to the reader an urchin looking up at a very green apple just out of reach. He honestly has no intention of picking it; but the apple, grown large and ripe, will hang lower, the urchin will be a little bigger, his appetite a little sharper, and who will vouch for persistent abnegation?

The writer, however, accepts the German Chancellor's declaration as *bona fide,* and as being the exponent of sanest German opinion; but, granted its sincerity and even efficacy, the German danger to Brazilian territorial integrity is no less real. This brings us to the point of view of those who find cause for alarm in the circumstantial, relative and topographical position of the German colonies.

To bring the situation home to the reader, let him imagine all the Germans in the United States massed in the extreme southeast of the Union, and let this region be from fifty to a hundred years in advance of the entire residue of the country in general civilization, wealth, military and political predominance and governmental stability.

Such are the basic conditions in Southern Brazil to-day. Progress has made its march south from Rio de Janeiro and Sao Paulo through Paraná, Santa Catharina and Rio Grande do Sul, while to the north it has lost itself in Minas Geraes as abruptly as the green that borders a desert. From time to time in the past decade the cry has gone up both from North and South for a division and two sister republics,—from the South because it feels the drag of the vast undeveloped and drowsy North; from the North because it chafes under the political usurpation of the South.

Given continued German immigration to this wealthy southern region already dominated by a Teuton contingent which successfully resists assimilation, what is more logical than the conclusion that the disproportion will increase and separation become inevitable from sheer preponderance?

It is the feasibility of this separation which gives the phrase "German danger" its deepest significance; for should separation come, what doubt can there be that the Republic of the South would be essentially German?

Speaking from a knowledge of local conditions and familiarity with Brazilian and German opinion, direct aggression by the German Government is in no way to be feared. A step which would plunge Germany into a war with the United States, allied to an outraged people numbering eighteen millions, would be presumptuous beyond reason. Nor does the fear that the German colonies, when strong enough, will revolt and ask for annexation at the hands of their mother country seem justified, since annexation, tho it would be of inestimable benefit to that country, could bring no adequate return to those who individually had fled imperial rule.

Far more perilous to Brazilian integrity is the chance that the tide of circumstances may awaken the German colonies to the dream of a German republic. And from their point of view what ambition could be grander, more justifiable than the foundation of such a State, free to expand among neighbors of weaker mettle,—a land of milk and honey, to which would inevitably flock thousands of those who to-day chafe under the restrictions and burdens of empire, and who would flee from the unrest of social Germany with no feeling of desertion were they called to the El Dorado of their desires, a German Republic!

SAO PAULO, BRAZIL

England's Music—War-Drum or Pipe of Peace?

BY JUSTIN M'CARTHY

THE question which I have made a title for this article might well have been asked in perfect sincerity by any impartial observer studying the policy of the English Government during recent days. The Conservative Administration have been boasting loudly, and I am willing to add not unreasonably, of the prospects for peace which have been opened up by the formal arrangement with France just announced. But, on the other hand, we have had the forcible invasion of Tibet, the maintained alliance with Japan, and the intimations officially given that Russia had much better take care of what she is about or she may bring on her the intervention of England. Last Tuesday the Parliament resumed its sittings after the Easter recess, and on Wednesday the prevailing note of England's music came from the pipe of peace and not from the war-drum. It was announced on the part of the Government that the invasion of Tibet is virtually at an end, that the English Government has no intention of establishing any control over Tibet, or of settling any Ministerial representative in the capital of the lone land, and, in fact, that nothing has come out of the expedition except the massacre of many hundreds of almost unarmed Tibetans and the wounding of one English newspaper correspondent. It seems to me easy to infer from the speech of Arthur James Balfour that the Prime Minister was just as little in sympathy with the whole policy of that luckless expedition as any member of the Liberal Oppposition could well have been. Mr. Balfour was evidently forced on against his will and his better judgment by Lord Curzon, the Viceroy of India, into that Tibet mission, which at the time did not seem likely to bring about so sudden and so hideous a disaster. I must say that, according to my judgment, if Mr. Balfour had only a stronger will and would impress his own purposes and his own policy on his colleagues in the Administration, it might be now a much better day for the Conservative Government. But Mr. Balfour has been out of health lately, and he is, in any case, more of a thinker, perhaps it might even be said a dreamer, than a practical worker, and he is not always up to the mark of enforcing his own more enlightened opinions on the dull Imperialism of his leading associates. Why any expedition should ever have been undertaken for the peaceful or other invasion of Tibet it passes the wit of ordinary mortals to understand. Why should not Tibet keep her territory all to herself under the protection of China if she thinks it a moral and religious duty to do so? No doubt it is much more reasonable for nations to receive strangers from all parts of the world and get new ideas; but if some particular nation thinks it right to exclude such visitors we may, indeed, pity them for their narrow mindedness, but we have hardly any right to force our enlightenment upon them. If we have such a right, then I do not see why England should not send a very friendly but very strongly armed expedition into the territory of her ally, Japan, for the purpose of getting at the Japanese capital and compelling the Japanese—by force of argument if possible, but otherwise if not possible—to adopt the religion of Christianity! To talk of the Tibetan expedition as a purely peaceful mission is utter absurdity. The Tibetan rulers refused to receive any such mission from England, the mission went its way toward the Tibet capital armed as if for battle, and the result was a massacre of Tibet men. The only comfort is that worse would probably have come to pass if the expedition had gone farther on its way, and that England has got out of the entire trouble better on the whole than at one time might have been expected.

COLONEL SEELY

The prospects of the Conservative Government are not by any means growing more cheerful. A remarkable illustration of this fact is found in the triumphant return of Colonel Seely without opposition to his former place as representative of the Isle of Wight. Colonel Seely had represented the Isle of Wight in the House of Commons for some time and was a stanch Conservative and, therefore, a supporter of the present Government. Lately, however, he could not endure the course taken by the Government on some important questions; he voted against the Ministry, and he then announced that in order to vindicate his conduct in the eyes of his constituents he would resign his Parliamentary seat and offer himself for re-election, leaving the voters of the Isle of Wight to deal with him as they thought fit. This was a gallant and public-spirited course of action on the part of Colonel Seely, and even his opponents admired him for his courage and his chivalry. He could not be compelled to resign his seat for the Isle of Wight and he could not have been turned out by his constituents against his will until the General Election comes on. So he resigned his seat and then presented himself to his constituents as a candidate for re-election. He was re-elected without the slightest attempt at opposition. No other candidate was even talked of as a possible opponent.

The London newspapers which support the Government through thick and thin declared that the Ministers regarded Colonel Seely and the whole incident as too insignificant to be worth the trouble of promoting a contest at the election. This would seem to all ordinary mortals a little too thin or too thick even for the thick-and-thin supporters of the present Administration. Of course, it would have been a delightful triumph for the Ministry if a supporter of theirs could have carried the seat against Colonel Seely or could even have reduced him to a very narrow majority. But the Ministers knew very well that they had no such chance and preferred to say "we might an' if we would" rather than be compelled to proclaim that they tried and could not. Colonel Seely received a splendid welcome back to the House last night.

The House of Commons is about to suffer, it would appear, a great political loss by the withdrawal of Sir Michael Hicks-Beach from public life. Sir Michael is one of the foremost and ablest men on the Conservative side of the House, and his retirement from political work will be about as great a loss to that side as the withdrawal of Sir William Vernon Harcourt will be to the other. Sir Michael has filled many high administrative offices and has been more than once Chancellor of the Exchequer. He withdrew quite lately from his place in the Conservative Government because he could not accept the policy of Joseph Chamberlain, and he is not a man to make any sacrifices of principle for the sake of personal position or with the hope that some day or other things might somehow muddle through better than the existing crisis would seem to promise. He is a man of great ability in general politics as well as in finance, a man of clear purpose and strong will, and altho not an orator in the higher sense of the word, is one of the most influential and effective debaters in the House of Commons. Sir Michael was more than once Chief Secretary to the Lord Lieutenant of Ireland, and while I was a member of the House of Commons I had many opportunities of appreciating his political

capacity and his fairness of purpose. I was, of course, always and absolutely opposed to the general policy with regard to Ireland which Sir Michael conscientiously represented, but I always found him where that policy was not directly involved a statesman full of kindly inclinations toward Ireland, always willing to give full and attentive hearing to any claims which the Irish members had to urge with regard to the industrial and commercial wants of the country and one whose word could be absolutely relied on when he had been led by argument and evidence to see that there was some defect in legislation which intelligent statesmanship could remedy. I am glad to have this opportunity of paying my poor tribute to the sterling character and the great administrative abilities of Sir Michael Hicks-Beach.

Literature, I am glad to say, is beginning this spring to show some signs of a renewed activity for which we have long been looking out. One of the most remarkable books published in England for some time is the volume which bears the title of "Newman," by the Rev. Dr. Barry. Its subject is, of course, the late Cardinal Newman, whose passing over to that Church of which Dr. Barry is a member and a minister was one of the remarkable events of modern English history. Dr. Barry is a devoted and hard-working clergyman of the Church of Rome, but he has also made for himself a distinguished position in literature and is the author of some brilliant and successful novels or romances, of which "The New Antigone" and "Arden Massiter" must be well known to all American readers of fiction. Indeed, I doubt whether any novels of recent times have made a more distinct mark in literature than these brilliant stories. Dr. Barry's newest work gives us its author in his capacity as a scholar, a thinker and a poet. "Newman" is not, however, a mere biography, and it may be well to let my readers know at once that it is not in any sense a contribution to religious controversy. The most uncompromising oppenent of the Church of Rome may read with deep interest and even with sympathy this exposition of Newman's genius as a great English writer. Dr. Barry's principal purpose is to vindicate for Newman his place in literature, and I do not know that a better, more thoroughly appreciative and at the same time more just tribute could be paid to the work and to the memory of the man who will always be remembered in the history of Oxford and as a new force in English literature. Dr. Barry's book is in its language, in its critical judgment and in its literary exposition well worthy of its subject. The author's style is at once strong and graceful; it penetrates with ease to the inner meaning on every question on which it touches, and it is illumined on every page by some flash of artistic and poetic fancy. Newman was beyond all question one of the great masters of English prose whom our later generations have known, and he had also, I need hardly say, a gift of genuine poetry which would make for him an abiding memory even if he had never been the leader in a great religious movement. Dr. Barry is well qualified in every respect to expound and to illustrate the writings of such a man, and he has given us a book which I feel well assured will have its place in American as well as in English libraries.

Another book of a very different order, indeed, which has just been published here is also well deserving of careful consideration from critics and readers. This is a work in one volume which bears the name of "The Great Earl of

CARDINAL NEWMAN

Cork," and is compiled by Mrs. Dorothea Townshend. It is for the most part a collection of the letters and a condensation of the history of that Richard Boyle who went over from England to Ireland in the year of the Spanish Armada as an adventurer in search of a fortune, who made and lost fortunes in my native country, became a favored and fortunate engineer of English policy in Ireland under Queen Elizabeth, was the friend of Sir Walter Raleigh and of Edmund Spenser, and afterward obtained the title which he bequeathed to his family. Mrs. Townshend appears to have had access to many private letters and other documents which passed between Richard Boyle and his friends and had not up to this time found their way into print, and, indeed, the book has been fairly described as "a social history of Anglo-Irish society in the seventeenth century and a history of the English in Ireland under Elizabeth, James I and Charles I." I have read this volume with much interest and, indeed, I think it could hardly fail to interest most readers. But the moral which I draw from the career of the Great Earl of Cork is hardly, I presume, that which the authoress of this volume would desire to inculcate. It tells the story of a daring, a clever and unscrupulous adventurer who regarded Ireland as a conquered country out of which a fortune was to be made in the first instance and on which in the meantime the dominion of England was to be enforced for the purpose of extinguishing every attribute, evidence and sentiment of Irish nationality and converting the island into a mere English province, taking its customs, its language, its thoughts and its religion from the England of Queen Elizabeth. The career of Richard Boyle seems to me, therefore, to stand out in history as a proven failure. Ireland is now more thoroughly Irish, if that were possible, than she was in the days when the policy represented and applied by the Great Earl of Cork began to be put into practice. But none the less Mrs. Townsend's volume is rich in biographical, political and historical interest and may be read with instruction and profit even by those—and they will be not a few in the United States—who agree with me as to the lesson in statesmanship which is to be drawn from it.

London, England.

A Health to the Birds

BY SEUMAS MACMANUS

Here's a health to the birds, one and all!
A health to the birds great and small—
The birds that from hill and hedge call,
Through the islands and highlands of grey Donegal—
Here's a health to them.
Health to them, health to them all!

I

Here's a health to the mavis!
A health to the mavis that sits on the thorn,
And trolls a gay breastful to brighten the morn,
And lighten the load of the man in the corn!
May its breast ne'er be empty, its heart ne'er forlorn!
A health to the mavis!

II

Here's a health to the lev'rock!
A health to the lev'rock that loves the blue sky,
No bog is too low, no hill is too high,
And the moor's not too poor for the lev'rock to lie:
May its name, and its fame, and its song never die!
A health to the lev'rock!

III

Here's a health to the linnet!
A health to the linnet that lilts on the tree,
The little green-linnet so pretty to see,
The linnet whose tinkling tones gladden the lea—
High health, and heart-wealth, little linnet, to thee!
A health to the linnet!

IV

Here's a health to the blackbird!
A health to the blackbird who hides in the bush,
In the glen, far from men, where the dark rivers rush,
And rolls a full soul in the round notes that gush
From his silver-toned throat at dawning's first flush.
A health to the blackbird!

V

Here's a health to the wren!
Ay, a health to the wren, too, the devil's choice pet,*
Tho thousands of years he's owed a black debt,
And it's often we've made the vile thummikin sweat:
But, away with old scores! forgive and forget.
Here's a health to the wren!

Here's a health to the birds, one and all!
A health to the birds, great and small—
The birds that from hill and hedge call,
Through the islands and highlands of grey Donegal—
Here's a health to them—
Health to them, health to them all!

MOUNTCHARLES, DONEGAL COUNTY, IRELAND.

* It was a wren, we say, that betrayed to the soldiers the whereabouts of our Saviour; so our lads chase it, and persecute it, and kill it.

Literature

A Divorce Novel.

THIS is another story founded upon the divorce evil.* "The One Woman" was a social heretic's way of depicting the same thing. Fiction is becoming more and more the record of our immoralities. The average novelist appears to find his greatest inspiration in demonstrating whatever is perverse or decadent in the times. Just now there are a number of books on the market written for the express purpose of alarming every hope for the advancement of the race. And the practice is not to be condoned even when the author assumes the guardian angel right to undermine our confidence in human nature. These are not the kind of people we need to confirm our hopes and establish our faith. Rather they give the reader a literary preparation for a life of vice or despair. Thus the author of this volume approaches his subject with an ethical mannerism that is almost ministerial. But the trouble about the divorce evil is that it cannot be dramatized in fiction without introducing scandalous situations and portraying indecent emotions. It is a subject, therefore, that should be left to the coldly impersonal discussion of those who write upon social economics. The right people would thus become acquainted with the facts, and the others, the young and innocent, would escape much licentious information. However, in this story the author further confuses the symphony of our moral faculties by introducing an idea which so increases the obligations of the wicked that even a good man could not live up to it, unless he happened to be a Mormon. Mackemer admits to his wife Katharine that he loves Isabel, who is another man's wife. He does not make a virtue of this domestic delinquency, but being unable to repent, he and Isabel get divorces and are married. Meanwhile, Katharine is represented as a pale, patron-saint woman, too cold, too virtuously unenlightened in her relations to her husband; and these qualities are made to account for his deflection as much as do the immodest charms of Isabel. But when we observe how the offended wife rages on the sly and shows the symptoms of an almost animal jealousy, her coldness seems a literary device of the author to make out his case. We cannot believe in the rigidity or frigidity of a woman who pulls down her hair, pales and flushes with so much healthy rage. So far she is the common, primitive woman, familiar to all. But from this point she develops a feminine originality in morals that is poetic and bewildering enough to confound a Mohammedan. She declines to recognize the divorce, thinks of Mackemer as her husband, prays for his return with a fervor that would make the new wife frantic if she believed in prayer, uses all the telepathy of a morbid clairvoyant mind to win him back. But when the man actually returns, with characteristic feminine perversity she refuses to receive him. And this at least is not a literary invention. Let any woman face a crisis of her own making and neither angels nor prophets can foretell when the angle of her moral vision will change so completely as to give her piety an entirely new focus. So Katharine not only turns her spiritual back upon Mackemer, but she gives as her reason that he owes a debt to Isabel. He must save this serial wife from a life of shame. Also, she has so entered upon the sanctity of her calling that she desires only Mackemer's sublimated affections, leaving him at liberty to place the grosser kind at Isabel's disposal. But Mackemer's affections, however etherealized, were sufficiently developed to arouse his immediate wife's suspicions, and the distance between a woman's suspicions and jealousy is but a hair's breadth; so in the concluding chapters we are not surprised to see her descend upon the immaculate Katharine like an avenging heathen. And the arguments she uses against that woman's ethics are enlightening, even if they are carnal with temper. In real life there would be no adjustment of

* HE THAT EATETH BREAD WITH ME. *By H. A. Mitchell Keays.* New York: McClure Publishing Co.

such a situation, but in fiction it is easy. A train runs over the superfluous wife on her way home, and the divorced couple are permitted to contemplate their interrupted matrimonial experiences without further embarrassment.

Bird Musicians

SOME seven years ago Professor Mathews burgeoned into publication with alluring essays on the songs of wild birds and meadow folk and what they meant. Now and again since then we have been coaxingly led by his progressive studies to believe the birds have a musical system all their own which we ought to understand to complete our education in h-a r m o n y. A sympathetic friend says Mr. Mathews has been tuning his ear to bird music since he was a boy of six years, and after reading his book,* the embodiment of his labors upon the subject, we may believe the tale.

To begin with, we are convinced the author is a bird lover. The work contains reproductions of his own water-color and pen and ink studies and complete musical notations. He has adopted the realistic Japanese method of picturing the birds in action. They are generally flying, and each quaint characteristic of beak, feather and claw may be seen. The migration table, showing the best time to hear bird songs, is a happy thought. Some whimsical notions include the parallels between the music of the old masters and our feathered friends and the using of modern musical themes for the illustration of bird song motives. We may put the sooty-billed cuckoo, robin, flicker, black-throated green warbler, Nashville warbler and whip-poor-will on parade and not one will mix his rhythm with other members of the choir. The Peabody bird would be the joy of a Verdi, for he represents well-separated tones in connection with rhythmic beat. If he feels like it he sings A and skips B C and D to E. Ordinary beings do not quite comprehend bird voices yet; they are placed so high, far above the last octave on the piano. It is remarkable how the little musicians

The Ruby-throat on the Wing
From Mathews's "Wild Birds and Their Music." Putnam's

* FIELD BOOK OF WILD BIRDS AND THEIR MUSIC. *Being a Description of the Songs and Colorings of Wild Birds. Intended to Assist in the Identification of Species Common in the Eastern United States. By F. Schuyler Mathews.* With 53 full page illustrations (38 colored) and numerous musical diagrams. New York: G. P. Putnam's Sons. $2.00.

take high jumps over an interval and then hit the correct tone. The cuckoo sings a major and the field sparrow a minor third. All birds sing in measured time. The whip-poor-will has a choice reputation for good six-eight time.

Of all utilitarians the yellow-billed cuckoo takes the prize. He deigns to Gr-r-r r-olp, etc., in good time, only when he has made away with a family of juicy caterpillars. His black-billed relative has a distinctive feature in his solo, the rhythmic recurrence of the rest. In the "Pastoral Symphony" Beethoven employs two of the cuckoo notes, along with the nightingale's trill and the call of the quail. A monotonous song telling of rain belongs to the flicker, while the downy woodpecker works out a military tattoo. The nocturne is the musical pattern of the whip-poor-will, and his weird whistle runs the gamut of his theme. The original roof-garden artiste is the hawk, who strikes out his queer notes as high up in the sky as he can.

The pewee among the fly-catchers is noted for tone. The king bird practices the rising inflection to some advantage, but the author thinks him a scolding musician, and in this differs from Olive Thorne Miller. This lady says he is a delightful husband and coos the sweetest of love songs to his mate. Very likely the two bird lovers ran across different types of married musicians. One sang well to his wife and other didn't. Such moods are not unknown with us where the domestic sphere and art are mismated.

The phœbe doesn't seem to care where he sits when he sings. It may be a fence gate or end of the chicken coop from which he pours out his swishing whistling chords, full of love and pathos. His mind is above his condition. The tune of the wood pewee is given largo, while the jay's quick cat-calls disgust all other birds, who look when he sings like bored listeners at the opera. The crow is famous for his major third. The bobolink belongs to opera bouffe. Like many expensive headliners, he only sings while happy. When he quits courting he quits singing. The author hasn't a decent word for the Mormon musician, the cow bird, who is a degenerate parasite and sings low-down songs to whosoever happens his way. Anthony Comstocks of the bird world seem to worry him into seasons of better life, but these don't last long. When his wicked moods come on again he is off singing songs unfit for the ears of dove and thrush.

The orchard oriole is remembered for his flexible, expressive notes, while his Baltimore relative takes a longish time introducing his solo, but, when he starts, sings a well-constructed song. The bronze grackle's voice is like a squeaky gate, but is useful in the choir. The vireo and the purple finch are the envied members of Nature's choir. The untrammeled warble of the finch causes even birds to wonder, no matter how often they hear it. His theme is the tarantella. The vireo's is a rapid dance tune. The goldfinch puts every one in good humor and his voice is full of glee. The snow bunting favors Greenland audiences most, giving us only a few disconnected notes. The vesper sparrow has a spiritual nature and sings after fasting. He flies high upon a bough, brushes his coat carefully, assumes a pious pose and expression, and swells his voice like an organ.

The trueness to nature and artistic quality of the book make the reviewer almost forget its scientific significance and creates the desire to entice Nature's choir into some magic forest and indulge in a box seat on a shady bough for all the performances.

Huneker the Rhapsodist*

To the ordinary reader of conventional literature a dip into one of Mr. Huneker's books will be like a plunge into an unknown sea. He will find himself in a new element. He will rise with his whole being in a glow, whether of enthusiasm or of anger will depend on his temperament, but does not matter much; both start the circulation. If he be of timid mind he will feel lost without the classical landmarks. Instead of the usual quotations from Ruskin, Tennyson, Emerson and Kant, he will hear only of Nietzsche, Serao, D'Annunzio, Moore (George, not Thomas), Maeterlinck, Stirner, Huysmans, Yeats and Przybyszewski.

Huneker is a prose Strauss. His

* OVERTONES: A BOOK OF TEMPERAMENTS. STRAUSS, PARSIFAL, VERDI, BALZAC, FLAUBERT, NIETZSCHE AND TURGENIEFF. *By J. C. Huneker.* New York: Charles Scribner's Sons. $1.25.

adoration of the great composer, to whom he dedicates the volume, seems to have controlled his style, and he revels in what he ascribes to Strauss,

"violent disassociation of the old phraseology; smug harmonization, melodies that fall gratefully into the languid channels of our memory —in a word, the mechanical disposition of stale material is transformed, undergoes permutation to make way for a new syntax, a nervous, intense method of expression, strange elliptical flights, erratic foreshortenings, with classic and romantic canons cast to the winds."

Huneker is a Heraclitean philosopher. He knows nothing but fluxions. The old landmarks drop out of sight. The standards of criticism melt away, and no new ones take their places. There are no fixed points from which it is possible by any mental triangulation to determine the position of a third. He does not hesitate to contradict any one, even himself. He fuses together in a single phase half a dozen arts. The nine muses lose their identity in his pages. On account of his easy way of transferring the adjectives appropriate to one sense to the use of another, it is sometimes impossible to tell from the phraseology, when we open to a page, whether he is describing a novel, a drama, a symphony or a system of ethics. We hear of "ugly music and hieratic, music bitter and sweet, black music and white," "music full of frowning mountains, fragrant meads and barren places," and many other such verbal curiosities. *Overtones* differs from the "Melomaniacs" chiefly in being written in the first person. Altogether it is very fascinating,—or, if you prefer, exasperating.

We have done Mr. Huneker injustice if, in talking so much of his style, we have given the impression that the matter is less important. Yet we are inclined to lay the blame of this on the author, for he frequently says a thing so appositely that, in admiring it, we do not realize for a moment how apposite is what he has said. Most of the essays in this volume deal with what he calls the "Anarchs of Art," the revolutionists, the swallowers of formulas, as composers, poets, novelists and philosophers. Richard Strauss is the avowed subject of the first, and the main subject of all the others. The second article is a scathing analysis and criticism of "Parsifal." "It is Wagner's own Götterdämmerung, the sunset music of his singular career." Yet he does not doubt that

"here in America, the Land of the Almighty Hysteria, this artificial medley of faded music and grotesque forms is sufficiently eclectic in character to set tripping the feet of them that go forth upon the mountains in search of new, half-baked religions."

Following this is something hard to find elsewhere, an excellent exposition of "Nietzsche the Rhapsodist," his life, his writings and the reasons for them, and especially his relation to Wagner. He discusses also, tho all too briefly, the remarkable way in which Nietzsche has influenced the younger writers and musicians of Europe. America so far seems to have escaped the infection, perhaps because only part of his works have been translated, and these not always comprehensively. As a characterization of Nietzsche in a few lines nothing has been written better than this:

"In his divagations with a hammer, Nietzsche smashed all idols, old, new and to come. He likewise, in his intellectual fury and craving after universal knowledge, smashed the exceedingly delicate mechanism of his own brain. Boasting of Polish blood, he, like Poland, represented a disintegrated individualism."

Of the rest of the volume, dealing with a miscellany of musical and literary topics, one of the best is the review of George Moore's novel, "Evelyn Innes" and "Sister Teresa," with the peculiar musical, theatrical, esthetical and ethical *motifs* of which Mr. Huneker is especially qualified to deal. Altho *Overtones* is ostensibly a book on musical topics, readers who do not know a tone-poem when they hear it (or see it, or taste it, if we must adopt the new phraseology) will enjoy the whole book as much as competent musicians—and some parts of it probably more.

Landscape Gardening. By Samuel Parsons, Jr., Superintendent of Parks, New York City. New York: G. P. Putnam's Sons.

Mr. Parsons's admirable work on Landscape Gardening ought to be very welcome to all those who are making their homes in the country. Mr. Parsons has long stood before the public as a representaive of common sense in

gardening and lawn making. For instance, he tells us that:

"To cut and chop trees and shrubs every year may be a more pernicious practice than to leave them entirely alone. It is safe to say that what we want in a tree or shrub is to see its special and most characteristic beauty. We want to see its peculiarities naturally developed, and not pruned into some monotonous and semi-artificial shape."

He would simply remove dead wood, and relieve the plant of branches that are weakened by age, and from superfluous suckers, and leave it to speak for itself. He is conservative in the selection of trees and shrubs; not making the blunder of many landscape artists, who seem
